This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

THE PENNY CYCLOPÆDIA

OF

THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.

LIMO'NIA, a genus of plants of the natural family of *Aurantiaceæ*, so called from the original Indian names, *Neemoo* and *Leemoo*, of the Lemon. Several of those described under this genus by Dr. Roxburgh have been referred to *Atalantia* and *Glycosmis*. The species still included are rather heterogeneous in nature, and will probably require further separation. As most of the family abound in essential oil, so the leaves of some of the Limonias are fragrant, and the fruit, though small, of *L. acidissima* and *crenulata* is very acid. *Limonia laureola*, referred to this genus by Dr. Wallich, in his 'Plantæ Asiat. Rar.' t. 245, is remarkable as the only plant of this family found on the tops of cold mountains. The people of the Himalayas, remarking its highly fragrant leaves, fancy that it is by feeding on them that the musk acquires its strong and peculiar flavour.

LIMOUSIN, or **LIMOSIN**, a province of France, now comprehended in the departments of Corrèze and Haute Vienne. Limousin comprehended an area of 3900 square miles, watered by the Vienne, one of the great tributaries of the Loire, and by the Dordogne, and its tributaries the Isle and the Vezère, all belonging to the system of the Garonne. The province was divided into two parts by the Vezère. Haut or Upper Limousin was to the north-west of that river, and had Limoges for its capital: Bas or Lower Limousin was to the south and east; its chief towns were Brives and Tulle. Limoges was the capital of the whole province. Limousin was included in the dioceses of Limoges and Tulle, the bishops of which were both suffragans of the archbishop of Bourges.

This district was antiently inhabited by the Lemovices, a Celtic people conquered with the rest of the Celts by Cæsar. In the subsequent division of Gaul into provinces, Limousin was included in Aquitania: and upon the subdivision of that province, in Aquitania Prima. It formed part of the dominions of the Visigoths till the overthrow of Alaric II. by Clovis at the battle of Vouglé, or Vouillé, in Poitou. It was subsequently under the government of the dukes of Aquitaine, or of Guienne, from whom it was taken by Pepin le Bref. It was subsequently included in the great duchy of Guienne, under which Limoges, its capital, became a vice-county. It was in a quarrel with Adémar V., viscount of Limoges, that Richard I. (Cœur de Lion), king of England and duke of Guienne, lost his life, being shot with an arrow as he was besieging the castle of Chalus in Limousin. The possession of Limousin was subsequently disputed by the kings of England, as dukes of Guienne, and the kings of France. It afterwards came by marriage into the hands of the dukes of Bretagne, and later still into those of the counts of Albret. It was inherited by Henri IV. from his mother Jeanne d'Albret, and was by him united to the French crown.

LIMOUX, a town in France, capital of an arrondissement in the department of Aude, and on the bank of the river Aude. The streets are paved and lighted, and the houses are of tolerably good appearance. The market-place is a regular square. There are two churches, four public fountains, and a public walk. The public edifice most deserving notice is the gate of La Trinité, a modern erection, near the bridge over the Aude. The population in 1831 was 6247 for the town, or 6518 for the whole commune; in 1836 it was 7105 for the commune, showing an increase in five years of nearly 600, or almost 10 per cent. The principal manufactures are of leather and woollen cloth; there are several oil-presses, and in the neighbouring district there are iron-works. The surrounding country produces good white wine. There are a high school, an agricultural society, an hospital, and a small collection of paintings, beside several government offices for judicial or fiscal purposes. The town is about 12 miles south-west from Carcassonne, the capital of the department.

The arrondissement comprehends 688 square miles, and had a population in 1831 of 72,707, in 1836 of 75,891: it is subdivided into four cantons and 150 communes.

LI'MULUS, the name for a genus of crustaceans, one of the most known of which is popularly called *The King Crab*. [Xiphosurians.]

LINA'CEÆ, a small natural order of plants, related to Cistaceæ, from which it differs in having an ovary with many cells, containing one or two seeds each, several styles, a definite number of stamens, &c., and to Geraniaceæ, from which the separate styles and peculiar fruit of Linaceæ abundantly separate that order. The definition of Linaceæ may be briefly expressed thus: polypetalous, hypogynous, monadelphous exogens, with a broken-whorled calyx; a many-celled, many-styled ovary, containing one or two pendulous ovules in each cell, and a capsule splitting at the point into as many valves as there are cells. The fruit is remarkable for having each of its carpels divided into two cells by a spurious dissipiment originating inside the back, so that in reality each cell is two-seeded, although from the presence of this spurious partition it seems to be one-seeded.

But although Linaceæ approach the two orders already named in the structure of the organs of fructification, the vegetation is essentially different, the leaves being alternate, free from all trace of a volatile secretion, and destitute of stipules, and the nodes of the stem not being capable of disarticulation. The whole order contains but two genera, Linum and Radiola: the former comprehends many species, the most important of which is common flax, Linum usitatissimum, the woody tissue of whose stems is so valuable for its toughness and fineness, and whose seeds furnish linseed oil. [Flax, where the plant is called by mistake *Linum perenne;* Linseed Oil; Linum.]

LINACRE, or **LYNACER, THOMAS**, one of the most eminent physicians of his age, descended from the Linacres of Linacre Hall, in the parish of Chesterfield in Derbyshire, was born at Canterbury about 1460. He received his first education in his native city, under William Tilly, or De Selling, and afterwards entered at Oxford, where he was chosen a fellow of All Souls College in 1484. Anxious for further improvement in learning, he accompanied De Selling into Italy, whither he was sent on an embassy to the court of Rome by King Henry VII. De Selling left him at Bologna with strong recommendations to Angelo Poliziano, then one of the best Latin scholars in Europe. Linacre removed thence to Florence, where Lorenzo de' Medici allowed him the privilege of attending the same preceptors with his own sons; and under Demetrius Chalcondylas, who had fled from Constantinople at the taking of that city by the Turks, he studied Greek. He then went to Rome, and studied medicine and natural philosophy under Hermolaus Barbarus. He applied himself particularly to the works of Aristotle and Galen, and is said to have been the first Englishman who made himself master of those writers in the original Greek. He also translated several of Galen's treatises into elegant Latin, and with Grocyn and William Latymer undertook a translation of Aristotle, which was never completed. On his return to England he was incorporated M.D. at Oxford, which degree he had taken at Padua, and gave temporary lectures in physic, and taught the Greek language at Oxford. His reputation became so high that King Henry VII. called him to court, and entrusted him with the care both of the health and education of Prince Arthur.

In the reign of Henry VIII. Linacre stood at the head of his profession, and showed his attachment to its interests by founding two lectures on physic in the university of Oxford, and one in that of Cambridge. He may also be considered the founder of the College of Physicians in London; for in 1518 he obtained letters-patent from King Henry VIII., constituting a corporate body of regularly bred physicians in London, in whom was vested the sole right of examining and admitting persons to practise within the city and seven miles round it; and also of licensing practitioners throughout the whole kingdom, except such as were graduates of Oxford or Cambridge, who by virtue of their degrees were independent of the college, except within London and its precincts. The college had likewise authority given to it to examine prescriptions and drugs in apothecaries' shops. Linacre was the first president of the new college, and at his death he bequeathed to it his house in Knight-Rider-street, in which the meetings of the members had been held. Before this time medicine had been practised without control by pretenders of all kinds, but chiefly by monks, who were licensed by the bishops; and this charter was the first measure by which the well-educated physician was afforded the least advantage, beyond that which his own character would give him, over the most ignorant empiric.

Highly as Linacre was esteemed in his profession, he became desirous to change it for that of divinity, or rather to combine the two pursuits. In 1509 we find him in possession of the rectory of Mersham, which he resigned in the latter part of the same year, and was installed into the prebend of Eaton in the church of Wells; and afterwards, in 1518, he became possessed of a prebend in the cathedral of York, where he was also for a short time precentor. He had other preferments in the church, some of which he received from Archbishop Warham, as he gratefully acknowledges in a letter to that prelate. Dr. Knight informs us that he held a prebend in St. Stephen's chapel, Westminster; and Bishop Tanner, that he had the rectory of Wigan in Lancashire. He died of the stone, after great suffering, Oct. 20, 1524, and was buried in St. Paul's cathedral, where Dr. Caius erected a monument to his memory.

In his literary character Linacre holds a high rank among the men of learning in this country. He was one of the first, in conjunction with Colet, Lily, Grocyn, and Latymer, who revived or rather introduced classical learning into England; and he conferred a benefit on his profession by translating into Latin several of the best pieces of Galen. These were, the treatises 'De Sanitate tuenda,' fol., Par. 1517; 'Methodus Medendi,' fol., Par. 1519; 'De Temperamentis,' 4to. Cambr. 1521;[*] 'De Pulsuum Usu,' 4to. Lond. 1522; 'De Naturalibus Facultatibus,' 4to. Lond. 1523; 'De Symptomatum Differentiis liber unus. Ejusdem de Symptomatum Causis liber tres,' 4to. Lond. 1524. In these versions Linacre's style was excellent.

Linacre's translation of Proclus, 'De Sphæra,' was printed in the 'Astronomi Veteres' of 1499. His translation of Paulus Ægineta, 'De Crisi et Diebus decretoriis, eorumque signis, Fragmentum,' 8vo. Bas. 1529. He also wrote a small book upon the Rudiments of Latin Grammar, in English, for the use of the Princess Mary, first printed by Pynson without date, and afterwards translated into Latin by Buchanan. But his most learned work was his treatise 'De Emendata Structura Latini Sermonis libri sex,' printed at London immediately after his death in 1524, and frequently reprinted in later years in the sixteenth century.

Of Linacre's talents as a physician no testimony remains except the high repute which he enjoyed. For the excellence of his translations from Galen it may be sufficient to quote the praise of Erasmus, who, writing to a friend, says, 'I present you with the works of Galen, now, by the help of Linacre, speaking better Latin than they ever before spoke Greek.'

There are two copies of Linacre's 'Methodus Medendi, upon vellum, in the British Museum: one a presentation copy to King Henry VIII., the other to Cardinal Wolsey; and a dedicatory letter, in manuscript, to Wolsey, precedes, *in his copy*, the dedication to Henry VIII. The Museum also contains the treatise 'De Sanitate tuenda,' upon vellum. This was Wolsey's copy, and has the cardinal's hat illuminated in the title, and a similar dedicatory letter similarly placed.

LINCOLN. [LINCOLNSHIRE.]

LINCOLN COLLEGE, Oxford, was founded in 1427, by Richard Flemming, or Flemmynge, bishop of Lincoln, for a rector and seven fellows; it was afterwards greatly augmented by Thomas Rotherham, bishop of Lincoln, subsequently archbishop of York, and lord high chancellor of England, who added five fellowships, and gave a body of statutes to the foundation, in which he limited the election of the fellows to the old dioceses of Lincoln and York, with the exception of one to the diocese of Wells. This was in 1479. Lord Crewe, bishop of Durham, and sometime rector of this College, in 1717 made an addition to the emoluments of the rector and fellows, and in 1718 endowed twelve exhibitions of 20*l.* a year a-piece. The scholarships and exhibitions received a further augmentation at a later time, by the will of Richard Hutchins, D.D., rector from 1755 to 1781.

The present foundation consists of a rector, twelve fellows, eight scholars, twelve exhibitioners, and one bible-clerk. The total number of members upon the books on December 31, 1837, was 132. The patronage consists of the rectories of Cublington and Twyford in Bucks, of Winterborne Abbots with Winterton Stapleton in Dorsetshire, of Hadleigh and Leighs Magna in Essex, and of Waddington in Lincolnshire; with the curacies of All Saints and St. Michael's in Oxford, and of Forest Hill and Combe-Longa in Oxfordshire. The buildings of Lincoln College retain much of their original character. They consist of two quadrangles, besides six sets of rooms erected at a later period. The largest quadrangle includes the rector's lodgings, library, and hall, built in the fifteenth century; the library was originally the chapel. The smaller court was in part built about 1612 by Sir Thomas Rotherham. The present chapel, upon its south side, was built in 1631, by archbishop Williams. The windows are rich in painted glass procured by the archbishop from Italy in 1629. In 1818 the whole front of the college was repaired, and much improved in its appearance by the addition of battlements and the introduction of appropriate Gothic windows. Among the more eminent members of this college were Dr. Robert Sanderson, bishop of Lincoln, archbishop Potter, Sir William Davenant the poet, Dr. George Hickes, Sir George Wheler, Hervey, the author of the 'Meditations,' and the celebrated John Wesley. (Gutch's and Chalmers's *Colleges and Halls of Oxford*; and the *Univ. Calendar* for 1838.)

LINCOLNSHIRE, an English county bounded on the north by the æstuary of the Humber, which separates it from Yorkshire; on the north-west by the county of York; on the west by the county of Nottingham, from which it is partly separated by the Trent; on the south-west by the counties of Leicester and Rutland; on the south by Northamptonshire; on the south-east by the counties of Cambridge and Norfolk, from the last of which it is separated by the Cross Keys Wash; and on the east by the North Sea or German Ocean. Its form is irregular, having its greatest length from north to south, 75 or 76 miles, from the bank of the Humber near the town of Barton to the bank of the Welland in the neighbourhood of Market Deeping; and its greatest breadth, 51 or 52 miles, from the junction of the three counties of York, Nottingham, and Lincoln, to the sea at Saltfleet. The area is estimated at 2611 square miles; and the population, in 1831, was 317,465, giving 122 inhabitants to a square mile. In size it is the second English county, Yorkshire alone exceeding it; in population the fourteenth, being rather less populous than Essex, and rather more so than Hampshire; and in density of population inferior to all other counties except Northumberland, Cumberland, and Westmoreland. It is comprehended between 52° 39′ and 53° 45′ N. lat., and between 0° 22′ E. and 0° 57′ or 0° 58′ W. long. Lincoln, the county town, is 121 miles north by west from London in a straight line, or 134 miles by the mail-road.

---

[*] This was the first book printed in England in which *Greek types* were introduced.

Coast-line.—The coast, from the Welland to the Humber, forms a tolerably regular curve convex to the sea, and is low and marshy, except about Clee Ness, near Grimsby, where the coast rises into cliffs. A bed of sand skirts the land, of varying breadth; and the forest which once occupied the fen country, where the trunks of trees are found under the soil, extended over a considerable space now covered by the sea. From the mouth of the Welland to that of the Nene the coast is so low as to require the protection of a sea-wall or bank. The present bank is more advanced toward the ocean than what is termed the old or Roman bank, so as to gain a considerable extent of land. The estuary of the Wash is occupied for the most part by sand-banks, dry at low water. Between these banks the streams which flow into the estuary have their channels. Two wide spaces, or pools of deeper water, between the banks, afford anchorage to vessels. The opening near the Norfolk coast is termed Lynn Well or Lynn Deeps, though in some maps the name of Lynn Deeps is given to the eastern channel of the Ouse. The opening near the Lincolnshire coast is called Boston Deeps: it forms a long narrow anchorage sheltered to seaward by Long Sand, Dog's Head, and Outer Knock, a range of sand-banks which run parallel to the coast to Skegness, north of Wainfleet. The water in Boston Deeps is usually from three to six, but in some places seven or eight fathoms deep. The coast between Boston and Wainfleet is occupied by a line of salt-marshes. There are other salt-marshes along the estuary of the Humber. (Arrowsmith's *Map of England*; Greenough's *Geological Map*.)

Surface and Geological Character.—A considerable part of Lincolnshire consists of alluvium, constituting a vast extent of flat or marsh land, from the border of which the adjacent strata rise and form comparatively elevated tracts. The alluvial soil occupies the whole of the coast, with the exception of the small insulated spot about Clee Ness. It skirts the bank of the Humber, and that of the Trent, as far up as Gainsborough. West of the Trent it spreads over Thorne Waste, or Thorne Level, from the midst of which rises the Isle of Axholme. This level was anciently occupied by a vast forest; the trunks of the trees are still found in great abundance beneath the present surface, rooted in the firm ground in which they grew. [AXHOLME, ISLE OF.] West of the Wash the alluvium extends inland from Wainfleet, by Spilsby, to the river Witham, up the bank of which it extends far above Lincoln. It spreads in breadth to a considerable distance (three or four miles) from each bank nearly up to Lincoln, where it is contracted to a narrow strip. Southward from the Witham the alluvium occupies half the breadth of the county, being bounded westward by a line drawn from Heckington, between Sleaford and Boston, to Uffington on the Welland, between Stamford and Deeping, and extending beyond the Welland and the Nene into Northamptonshire and Cambridgeshire. The alluvial country, from Wainfleet and Spilsby southward, forms part of the great fen country of England. The alluvium between Louth and the sea consists principally of unstratified clay mixed with sand and various marine deposits.

From Barton-upon-Humber to Burgh near Wainfleet a line of chalk downs extends, called the Wolds of Lincolnshire. These downs sink on the north and east beneath the alluvium described above. They form part of the great chalk formation which, though occasionally interrupted or covered by other beds, extends through England from Flamborough Head in Yorkshire to the coast of Dorsetshire. The length of the Lincolnshire Wolds is about forty-seven or forty-eight miles, their average breadth six or seven, their greatest breadth twelve or thirteen. The chalk is of two colours, red and white, disposed in regular strata, the red commonly undermost: in the white chalk seams of flint, two to six inches thick, frequently occur. The chalk is found extending under the alluvium in the marshes round the Wolds: water is obtained from it by boring through the superincumbent soil; and along the coast north and south of Saltfleet are natural outlets of water called provincially 'blow wells' ('flow wells' in Greenough's map), deep circular pits, which furnish a continual flow of water, and are vulgarly reputed to be unfathomable; they are presumed to communicate with the chalk. The chalk has been pierced by well-diggers 300 feet; but it is not mentioned whether the wells were sunk wholly in the chalk or through it.

The Wolds have their steepest escarpment towards the west, on which side the green-sand crops out and forms a narrow belt, skirting the chalk from Barton to Burgh. This formation is supposed to be thin. At the south point of its extension the green-sand sinks under the alluvium of the fen district. The iron-sand occupies a narrow belt of land west of the green-sand. These two formations constitute a range of hills extending from north-west, near Market Rasen, to south-east, near Spilsby, running nearly parallel to the Wolds, to which they adjoin at their north-western end, forming an inferior terrace, while in other parts they are separated from them by the valleys of the Bain and the Steeping.

Westward of the iron-sand extends a wide flat, watered toward the north by the Ancholme, and toward the south by the Witham, occupied, except where overspread by alluvium or by chalk rubble, by the Oxford or clunch clay. The district occupied by this formation is very narrow in the north, and becomes wider as it proceeds southward, until it disappears beneath the fens. Its breadth near the Humber is about three miles, east of Lincoln about fifteen miles, and between Sleaford and Spilsby twenty-five miles; but in this part it is partially covered by the marshes of the Witham. The elevation of this stratum scarcely exceeds that of the adjacent fens. It has been penetrated to the depth of nearly 500 feet, and its breadth may be probably estimated at 700.

The low district of the Oxford clay forms a large central valley separating the Wolds, with the adjacent hills, from the higher grounds formed of the oolitic strata, which extend southward through the county from the marshes which line the Humber. They are bounded on the east by a line drawn by Lincoln (where the oolites subside, forming a narrow gap of a mile or two wide, occupied by the Witham and the adjacent marshes), Sleaford, and Bourne to Uffington. This range of high land forms part of what have been termed the stonebrash hills, and separates the valleys of the Ancholme and the Lower Witham from those of the Trent and the Upper Witham: they have their steepest escarpment on the western side, which is called, south of Lincoln, Cliff Row. The western escarpment runs southward from Lincoln to the neighbourhood of Grantham, and then westward into Leicestershire. From the Humber to Lincoln these formations occupy a very narrow strip, varying from one or two to four miles wide; between Folkingham and Grantham they extend eight or nine miles in width; and between Bourne and Ab-Kettleby in Leicestershire, twenty-five miles. The eastern side of this range of hills consists, from Barton to Lincoln, chiefly of the great oolite; and south of Lincoln of the cornbrash and great oolite, separated by a thick bed of clay. The west side is occupied by the inferior division of the oolitic formations. Several stone-quarries are opened between Sleaford and Grantham. There are one or two outlying masses of oolite about Grantham, and between Grantham and Newark, separated from the principal oolitic range by intervening valleys occupied by the subjacent strata of lias.

This last-named formation occupies nearly all the rest of the county. Commencing at the Humber, where the district occupied by it is not more than two or three miles wide, it proceeds due south to Lincoln, southward of which it pervades all the western side of the county, except one small spot extending over the border into Nottinghamshire and Leicestershire. It is conterminous on its eastern side with the oolitic formations, from beneath which it crops out. The north-western corner of the county is occupied by the new red sandstone or red marl, which extends along the banks of the Trent, and from them westward into Nottinghamshire and Yorkshire. It is covered all round the Isle of Axholme (which is composed of red marl) by the alluvium of the Thorne Level, Hatfield Chase, and the contiguous marsh-lands. Gypsum occurs plentifully in this formation in the Isle of Axholme and on the border of the Trent; and there are mineral springs containing sea-salt and other purging salts in the neighbourhood of Gainsborough.

Hydrography and Communications.—The Trent touches the border of the county nearly midway between Newark and Gainsborough, and for about fifteen or sixteen miles separates the counties of Lincoln and Nottingham; from below Gainsborough to its junction with the Yorkshire Ouse its course of nineteen miles is almost entirely within the border of Lincolnshire. This river is navigable throughout that part which belongs to this county; and vessels of 160 tons can ascend to Gainsborough, where the river is crossed by a bridge. The Idle, which comes from Nottinghamshire, or rather the Bykersdyke or Vicardyke, a cut from the Idle, skirts the southern boundary of the Isle of Axholme, and falls into the Trent a little below Gainsborough on the left bank. The Bykersdyke and the Idle are navigable from East Retford. The old river Torne, another affluent of the Trent, skirts the Isle of Axholme on the north-west, and cuts (not navigable), distinguished as the New river Idle and the New Torne, pass from the rivers after which they are respectively named, through Axholme Isle into the Trent.

The Ancholme rises near the village of Spridlington between Lincoln and Market Rasen, and flows north-east six or seven miles to Bishop Briggs, when it is joined by a little river Rase from near Market Rasen. Here the navigation commences, and the stream is carried in an almost direct line by an artificial cut, about twenty miles long, into the Humber, a short distance west of Barton. The old channel of the river winds much more than the navigable cut, but coincides with it in the general direction of its course. This river serves to drain the marshes through which it flows. The Ancholme carries off the drainage of the valley between the Wolds and the oolite or stonebrash hills. The streams which fall into it are all small.

The Tetney river rises from two springs, one near Normanby and the other at Thorpe-le-Mire, near the south-western escarpment of the Wolds, between Binbrook and Market Rasen; the streams from these springs unite and flow by Binbrook and Tetney into the German Ocean between Grimsby and Saltfleet. The length of the river is about twenty-two miles. The mouth has been made navigable, the Louth navigation entering the sea there.

The Ludd rises near the south-west escarpment of the chalk range. It is formed by the junction of two or three brooks which unite above Louth and flow north-east into the German Ocean by several arms, one of which enters the sea by Grainthorpe haven between Tetney and Saltfleet, another near North Somercotes, and the third at Saltfleet. The length of the Ludd is about [illegible] miles. The Louth navigation consists partly of this river and partly of an artificial cut from the village of [illegible] to the mouth of the Tetney river: the navigation is about [illegible] miles long.

The Withern or [illegible] rises near Ashby Puerorum, and flows north-east into the sea at Saltfleet, where its estuary [illegible] the arms of the Ludd: its length is about twenty-four miles. In the upper part of its course it is called the Calceby Beck. The Steeping rises near Ashby Puerorum, and flows south-east, [illegible] from Spilsby, twenty miles into the sea. Wainfleet stands on a small feeder of this river, about three or four miles from the sea: small craft can get up to the town. This river was formerly navigable for larger vessels, but the water has been drawn off by the dykes cut for the purpose of draining the adjacent fen.

South of Wainfleet the fen district commences; and from the extensive system of draining that has been carried on, the hydrography of the county becomes very complicated. The rivers have in several places been diverted from their natural beds, and now flow in artificial channels in direct lines, and are connected with artificial cuts, which open a communication between rivers not naturally connected. We must therefore [illegible] the natural and artificial hydrography in this view from the impossibility of drawing exactly the line of demarcation between them.

The Witham, the most important river in the county, rises near the village of Thistleton, just within the border of Rutlandshire; but almost immediately passes into Lincolnshire, flowing northward to the town of Grantham, receiving by the way several brooks. From Grantham the river flows first north, then west, then north-west, and then north-east to Lincoln; two or three miles of its course [illegible] are on the border of the county, where it separates it from Nottinghamshire; the rest within the county. A few miles above Lincoln it receives, on the right bank, [illegible] Brant, nearly fifteen miles long, from [illegible], north of Grantham. At Lincoln the river turns eastward, and flows to the neighbourhood of Bardney Abbey, where it receives the united stream of the Langworth river and the [illegible] Beck. The principal source of this stream (the Langworth) is in the chalk hills between Market Rasen and Louth, and its whole course is about eighteen miles. From the junction of the Langworth, the Witham flows south-east to the neighbourhood of Tattershall, where it receives, on the left bank, the river Bain; and on the right bank the Sleaford river, or Kyme Eau. The Bain rises in the chalk hills at Ludford, between Market Rasen and Louth, and flows southward by Horncastle and Tattershall. Its length is about twenty-six miles: it receives the Waring, Scrivelsby, and Enderby Becks. There is a navigation eleven miles long, partly artificial, partly natural, from the Witham up to Horncastle. The Sleaford river rises near Ancaster, and flows north-east by Sleaford and South Kyme into the Witham: its course is about twenty-two miles: there is a navigable channel thirteen and a half miles long, partly natural, partly artificial, from the Witham up to Sleaford. From the junction of these streams, the Witham flows by an artificial cut to Boston, below which town it flows in its natural bed into the Wash. The whole length of the Witham may be estimated at from seventy-five to eighty miles, for about half of which it is navigable. In the upper part of its course to Beckingham, just above which it divides Nottinghamshire from Lincolnshire, its banks are diversified with rising grounds and picturesque objects. From Beckingham to Lincoln it flows in a wide sandy valley; at Lincoln it passes through a depression in the oolite or stonebrash hills: and soon after enters the fens, through which it has the rest of its course. At Lincoln it communicates with the Foss Dyke, and below that with the Horncastle and Sleaford navigation; there are also numerous cuts connected with it for the purpose of draining the fens. It is supposed that before the Conquest the Witham had a tideway navigation for large vessels up to Lincoln; but its navigation has been liable to frequent impediments, and has required much attention.

The Welland rises in Northamptonshire, and flows along the border of that county, which it divides successively from Leicestershire, Rutlandshire, and Lincolnshire. It first touches the border of Lincolnshire just above Stamford, from whence it flows to Deeping and Crowland, where what is termed the Old Welland runs northward to Spalding, while another arm called the Shire Drain proceeds along the border of the county, into the Wash at the mouth of the Nene. From Spalding the Old Welland is conveyed in a direct line by an artificial channel into the Wash. There is a navigation up to Stamford. Between that town and Deeping there is a canal by the side of the natural stream: below Deeping the natural channel is employed for about two miles; and then there is a navigable cut to Spalding. The navigation is about twenty-eight miles long from Stamford to the Wash.

The Glen rises between Grantham and Folkingham, and flows south by Corby to Barholm not far from Stamford; in this part of its course it crosses a projecting corner of the county of Rutland. Just below Barholm it receive a stream which rises near the Glen and has a course almost parallel to it. From the junction of this stream at Wilsthorpe the Glen flows north-east into the Wash at the mouth of the Welland. Its whole length is about thirty-six miles. A small rivulet which joins the Glen has been made navigable for three miles and a half, up to the town of Bourn; and below the junction of this rivulet the Glen is navigable for about twelve miles into the Welland between Spalding and the Wash.

A general account of the great fen district of England, and of the changes which it has undergone, is given elsewhere. [BEDFORD LEVEL.] The limits of the Lincolnshire fens have been already given, and it is only requisite to name some of the principal cuts and drains. The Car Dyke, which skirts the western border of the fens, commences in the Welland between Stamford and Deeping, and runs northward nearly thirty-five miles into the fens of the Witham, with the drainage of which it is connected. Some writers state that the Car Dyke runs into the Witham, but this appears not to be the case at present, though it may have originally been so. This canal is supposed to be of Roman origin: it is sixty feet wide, and has on each side a wide flat bank.

The South Forty-Foot is cut from the Glen by a circuitous course to the Witham at Boston: its length is about twenty-two miles: it receives a number of small streams flowing from the hills that form the western boundary of the fen country.

The North Forty-Foot runs ten miles from the Kyme, or Sleaford river, near its junction with the Witham, parallel to the Witham, into the South Forty-Foot, near Boston.

The West Fen Catchwater Drain, and the East Fen Catchwater Drain bound the fen district on the north side, and extend about ten and seven miles respectively; they do not immediately communicate. The Old and New Hammond Beck runs by a circuitous course from the Welland near Spalding to the South Forty-Foot near Boston. Its length is about twenty miles. The other cuts, provincially termed 'Leams,' 'Droves,' 'Drains,' 'Becks,' 'Eaus,' and 'Dykes,' are too numerous to admit of distinct notice. In the fens between the Glen and that arm of the Welland called the Shire Drain they are particularly numerous. The drainage of the northern fens is noticed elsewhere. [Ancholme.]

Of navigable canals, besides the Ancholme, Louth, Horncastle, Sleaford, Bourn, and other navigations already noticed, there are only two. One of them, the Foss Dyke, is probably a Roman work, and appears to have been used for navigation previous to the Conquest. Henry I. had it cleaned out and the navigation improved. Some have supposed him to be the author of it. It extends from the Trent at Torksey, once a place of some consequence, above Gainsborough, to the Witham at Lincoln; its length is eleven miles: it is level throughout, but its waters are four or five feet above those of the Trent. It is supposed to have been a continuation of the Car Dyke, which, though now used only for draining, is supposed to have been formed for the purpose of navigation: but there is no need to assume any connection between the Car Dyke and the Foss Dyke, if, as is likely, the Witham was anciently navigable for ships up to Lincoln. The other canal is the Stainforth and Keadby Canal, which opens a communication between the Don or Dun navigation at Stainforth near Thorne in Yorkshire, and the Trent at Keadby in Lincolnshire. This canal, which is fifteen miles long, has a part of its course in the Isle of Axholme in Lincolnshire.

Among the projected railways the Northern and Eastern was designed to pass through this county. It was to run from London by Cambridge to York. It was to enter Lincolnshire a little to the east of Market Deeping, and was designed to run nearly parallel to the present coach-road to Lincoln, and from thence first on the left, then on the right of the Foss Dyke to the Trent above Gainsborough. The execution of this railroad, except of the part from London to Cambridge, has been given up for the present.

The principal coach-road is the Hull, Barton, and Lincoln mail-road. This enters the county at Market Deeping, 90 miles from London, and runs north by west by Bourne (97 miles), Folkingham (106 miles), and Sleaford (115½ miles) to Lincoln (133 miles). From Lincoln the road runs due north in a direct line along an old Roman road for many miles; and then turning north by east, runs by Brigg, or Glanford Bridge (155 miles) to Barton (167 miles), on the south bank of the Humber, opposite Hull. The Louth and Boston mail-road branches off from the above just before it enters Lincolnshire, and passing through the opposite extremity of the town of Deeping, runs by Spalding (101 miles), Boston (116½ miles), and Spilsby (132½ miles), to Louth (148 miles); from whence a road runs onward to Great Grimsby (164 miles) on the Sea. The great north road (travelled by the Thurso, Edinburgh, and York mail, and by the Glasgow and Carlisle mail) enters the county at Stamford (89 miles), and runs north-north-west by Grantham (110 miles) into Nottinghamshire. Roads lead from Lincoln by Wragby to Louth, and on to Saltfleet; by Market Rasen to Grimsby; and by Newark to Nottingham. A road from Nottingham by Bingham falls into the high north road at Grantham; and a road from Yarmouth and Norwich, by Lynn and Wisbeach, falls into the Louth and Boston road at Spalding. The other roads do not require specific notice.

Agriculture.—The agriculture of Lincolnshire is interesting on many accounts. The soil varies greatly in different districts. In some places it is as rich and productive as the greediest farmer could desire, and in others so poor as to weary the patience and industry of the most persevering. The grazing land in this county cannot be surpassed in its capabilities for fattening cattle; and some of the drained fens and warp lands along the rivers possess a high degree of fertility when cultivated. From these circumstances it follows that every variety of cultivation which this island presents may be observed in this county. There are still some lands which are under the old course of two crops and a fallow, while others are cultivated with all the care which an improved system of husbandry recommends.

To give a general idea of the various kinds of soil, we will follow the division given by A. Young in his Report of this county, premising however that it cannot be considered as entirely correct, but only an approximation to the truth.

	Acres
He reckons of fen lands	776,000
Of loamy and sandy heaths, now mostly cultivated	118,400
Of wolds, chiefly chalk	234,880
Of various loams and sands of moderate quality	719,040
Making a total of	1,848,320

Upon the whole the majority of the lands in Lincolnshire may be said to possess a soil of more than medium fertility, compared with the average of Great Britain, and the produce of the county, both in grain and cattle, is very considerable.

The temperature of Lincolnshire is nearly the same as that of the centre of England. The flatness of the surface allows the winds to blow uninterruptedly over it, and of these the western are the most violent. Near the coast the sea tempers the cold easterly winds in winter, and the snow seldom lies long.

The climate in the lower parts, where, in spite of extensive drainings, much marshy ground still remains, is not very healthy, and intermittent fevers are prevalent; but they are becoming much less frequent since the draining and improvement of the soil. The water in the lower parts is bad and brackish, being procured only from wells and ponds; there is no such thing as a spring of pure water in the fens. The lands which have been reclaimed from the sea by banking and draining are mostly laid in large farms, which require a considerable capital. In other parts of the county there are many small properties, cultivated by the owners, and kept with great neatness. There were formerly many more of these than there are now. Lincolnshire exhibits great neatness in the care with which the land is weeded and manured, especially the light sands. The introduction of bones for manure has made many poor light sands in Lincolnshire vie with the best in production, and nowhere have ground bones been used so long and so abundantly. The turnips, which are raised by means of this manure on the poorest sands, being fed off with sheep, lay the foundation of a productive course without any other manure.

Among the different manures which are used for the arable land in Lincolnshire, we must not pass over that of fish, especially that small fish which abounds in shallow waters, and is named the stickleback. It is very soon putrid, and greatly assists the natural juices of the earth in producing vegetation.

On the richest fen lands the most profitable rotation consists of the following crops:—1, Cole, fed off with sheep; 2, oats; 3, beans; 4, wheat; 5, clover; 6, wheat. If wheat were sown immediately after the cole, it would be rank, and probably lodged. The oats and beans reduce it to a proper state, by exhausting a portion of the manure and preparing the soil better for wheat. The oats are always fine and abundant, seldom less than 8 quarters per acre, and often 10 and even 12 quarters.

In some heavy soils the Essex rotation is adopted:—1, fallow; 2, barley; 3, beans; 4, wheat; and this, alternated with the other, answers well on rich lands. A fallow once in ten years is almost indispensable, to keep the land free from root-weeds. The clover also recurs less often, and is consequently less apt to fail than when it is sown every sixth year on the same land. Those who have been induced by some eminent agricultural writers, such as Arthur Young, and others, to attempt to cultivate heavy and wet soils without an occasional fallow, have soon been obliged to return to this effective mode of cleaning land: the hoeing of beans or other green crops can never be executed so perfectly as to keep the land entirely free from those destructive weeds which have perennial roots. For the poor sands there is no system so advantageous as that of raising turnips, and feeding sheep with them on the land where they grow. The tread and urine of the sheep give consistency to the loose sand, and, for a time, impart to it the properties of a good loam, so that it will retain water sufficiently to supply the roots of the growing corn. If marl can be put on the surface at the same time, the nature of the soil will be greatly improved; and that which would only bear a crop of oats, will now become capable of giving a good return of wheat. Manure alone cannot effect this;

it would only cause the wheat to run to straw and lodge, and give no grain. To manure poor lands highly, without first consolidating them, is absolute loss of both dung and labour.

From the returns of forty different farms, A. Young has given the average produce in Lincolnshire as follows:—

Wheat—seed, 3 bushels; average crop, 3¼ quarters. Barley—seed, 3¾ bushels; average crop, 4½ quarters. Oats—seed, 6 bushels; average crop, 6½ quarters. Beans—seed, 3¾ bushels; average crop, 3¾ quarters.

It is probable that the general adoption of the drill in sowing, and the improvement of the cultivation since the report of A. Young, have increased the proportion of the crop compared with the seed about one-eighth.

The crops usually raised on the arable land are mostly the same as in other counties on similar soils. There is some woad cultivated in the neighbourhood of Boston on rich warp land; some sainfoin grown on the chalky soils, and lucern on the richer; but not to the extent to which this useful plant ought to be cultivated as green food for horses and cattle. Cabbages and carrots are cultivated to a considerable extent: the former on the heavy clays, and the latter on the light and deep sands.

The grass-lands of Lincolnshire and of the neighbouring county of Leicester are some of the best feeding lands in the kingdom. The average number of beasts of a moderate size, about 70 or 80 stone of 14lb., which can be kept on an acre, taken from twenty-six places, is stated by A. Young to be as follows:—sheep in summer, per acre, 3¾; sheep in winter, per acre, 2; acres to feed a bullock in summer with the sheep, 1¾. So that 1¾ acres of grass-land will feed—in summer, 1 bullock and about 6½ sheep; and in winter, 3½ sheep, which is a high average: some of these lands will feed a bullock and 6 sheep per acre all the summer.

Some of the finest pastures are fed off by horses which are fatted for the markets; but horses soon deteriorate the grass, while sheep improve it.

Graziers are not fond of mowing grass for hay. It renders the pasture coarse, and the hay is not of so rich a quality as might be expected, owing, probably, to a want of care in making it. Grass-land is occasionally broken up to grow woad or flax on it. When this is done very judiciously, it may be laid down with grass seeds and soon be good pasture again: but, in general, it is a long time before the newly-sown herbage is so fattening as the old grass. When grass-land is broken up it gives such rich crops, that the temptation to overcrop it is too strong to be resisted; and once exhausted to a certain degree, it cannot be restored to its richness for a long time. When arable land is laid down to permanent grass in a rich, clean, and unexhausted state, the success is invariable; but it is often done without attention, and a failure is the consequence.

One of the most effectual improvements on land, by the sides of some rivers in which the tide flows rapidly, is that of warping; or, in other words, retaining the water on the land so long as to let it deposit a layer of sand and mud. Thus a new soil is created over an old one; and this deposit [illegible] is always very fertile. Such is the benefit produced by warping, that expensive works have been raised for the purpose, and extensive tracts of poor land have been covered in a short time with a new soil of the finest quality, as the crops raised upon it will clearly show.

The warping is effected by letting in the water of the rivers which have a muddy current, by artificial channels [illegible] and retaining it there till low water. The [illegible] carries off, in its course over various soils, all the finer particles which are too light to be immediately deposited. These consist of every kind of earth and portions of vegetable and animal matter. The tides, which are [illegible] the direction of the current, keep this [illegible] by the agitation which is produced; [illegible] charged with earth is let in on the low grounds [illegible] river by means of canals and [illegible] deposited and forms a coat of mud [illegible]. Such is the quantity of earth [illegible] that a layer one-tenth of an inch in [illegible] between one tide and the next. [illegible] a new soil is formed of any depth [illegible] provided the land lies below the level of the [illegible].

[illegible] the warping fills up all inequalities [illegible] perfectly even surface is produced. Warp land [illegible] power of production, which cultivation and manuring cannot imitate. The basis of the soil is fine clay and sand, the latter minutely divided and intimately mixed with the former, with a considerable portion of fine calcareous earth. Very little vegetable matter can be extracted by analysis, but there is no doubt a very considerable portion of it in an insoluble state, probably combined with lime or argilla. Sufficient experiments have not yet been made to show this combination, as likewise the galvanic effects of the intimate mixture of the different earths. It is to be hoped that the attention of agricultural chemists will be turned to this subject. Considerable light may thus be thrown on the causes of fertility in soils.

The atmospheric air seems to act powerfully on the newly deposited warp; for before a fresh layer is deposited, which is within twelve hours, such an alteration has already taken place on the surface, that the new deposit does not unite in one mass with the last, but a regular stratification can be observed, which shows the quantity deposited in each tide. The new warp also requires to be stirred and exposed to the air for some time before it acquires its great fertility. It is therefore probable that the insoluble vegetable earth requires to be oxygenated and rendered soluble. The richest crops of beans, wheat, oats, and rape are raised without manure on the warp lands. It is not so well adapted for barley or turnips on account of its slimy nature.

It has added much to the produce of Lincolnshire, that the crops raised on the warp lands have enabled the farmer to employ all the manure made by the abundance of straw which these lands produce to improve the lands that lie above the reach of the waters. As long as the level of the warp lands allows a fresh addition of warp, this system is highly advantageous; but as soon as the surface rises to high-water mark, this system must cease, or the warp lands will be exhausted in time, like the Dutch and Flemish *polders*, and require manure like other lands. The best mode of treating warp lands which are too high to admit of being warped over again is to lay them down to grass in a state of great fertility. The pasture upon them will soon equal the best old grass, carrying a bullock per acre, besides several sheep during the whole of the summer.

In a county which contains so rich pastures it is of great importance that the breed of cattle and sheep be of the most profitable kind; accordingly we find that no county possesses finer breeds of horses, oxen, and sheep. The Lincolnshire horses are celebrated for their size and power. Horncastle fair is the great resort of all the London dealers, who purchase hunters and carriage-horses at very high prices. The horses which are bred in the fens are apt to have rather too flat and broad feet, from the softness of the pastures there. This is a great defect when they are intended for speed on hard roads; but for farm purposes they answer as well as those bred on drier soils. The best hunters are bred on the higher and drier lands; but they are generally turned off for a time in the richer pastures to give them flesh before they are sold.

The oxen which are preferred for grazing are the short-horns, and some crosses of long-horns. Mr. Collins's Durham breed has been introduced and kept up with considerable success. Some rich proprietors and farmers are very careful in maintaining the reputation of their stock; and fine bulls are reared without regard to expense, which is well repaid by the superiority of their produce. The most judicious graziers are of opinion that middle-sized oxen are more profitable for grazing than the larger: an ox of about 80 stones of 14 lb. is thought to fatten more rapidly in proportion than either larger or smaller, provided the breed be good.

There are not many dairies in Lincolnshire: breeding and fatting are considered more profitable and less troublesome. There is however some excellent cheese made of the Stilton kind. A. Young mentions Mr. Grundy, of Heath Hall, near Grantham, as an eminent cheese-maker. A descendant of his is now residing at Old Windsor, in Berkshire, where he makes the famous Forest cheese, which still goes by the name of Grundy cheese, and is the best cheese of the Stilton kind made in England. He was brought from Lincolnshire by George IV., and established in a royal dairy in Windsor Forest. The sheep which are bred in this county are principally of the long-woolled, commonly called Leicesters. But the two counties differ only in the great proportion of fen lands to be found in Lincolnshire. The rich upland pastures are similar in both counties. The old Lincoln sheep are larger than the improved Leicester and carry a heavier fleece; they are also hardier; the latter however are generally preferred, from their greater propensity to fatten. A cross has been produced which partakes of the qualities of both breeds, and is preferred by some for the fens.

There is nothing particular in the breed of pigs, except that it has been much improved of late years by crossing with improved breeds.

The principal fairs in Lincolnshire are:—Alford, Whit-Tuesday, November 8; Barton-upon-Humber, Trinity Thursday; Belton, September 25; Boston, May 4, August 5, November 19, and lasts four days, December 11; Bourne, March 7, May 6, October 29; Brigg, August 5; Burgh, May 13, October 2; Burwell, Old Michaelmas-day; Caistor, Friday and Saturday before Palm Sunday, Friday and Saturday before Whit-Sunday, Friday and Saturday after Old Michaelmas-day; Caythorp, Good Friday; Corby, August 26, Monday before October 11; Coulthorpe, April 29; Crowle, last Monday in May, November 22; Donnington, May 26, August 17, September 4, October 17; Epworth, first Tuesday after May 1; first Thursday after September 29; Falkingham, Ash Wednesday, Palm Monday, May 12, June 16, July 2, Thursday after Old Michaelmas-day, November 10 and 22; Gainsborough, Easter Wednesday, October 20, if it falls on a Wednesday, then the Wednesday after; Grantham, Easter Eve, Holy Thursday, July 10, December 17; Heckington, Thursday before October 10; Holbeach, May 17, second Tuesday in September; Horncastle, June 19-22, August 11-21, October 20-28; Kirton-Lindsey, July 18, December 21; Lincoln, Tuesday to Friday in the last whole week in April, July 5, first Wednesday, Thursday, and Friday after September 12, November 28; Louth, third Monday after Easter Monday, November 23; Market Deeping, second Wednesday after May 11, October 10, November 22; Market Rasen, September 25; Navenby, August 18, October 17; Partney, August 1 and 25, September 18 and 19, October 18 and 19; Sleaford, Plough Monday, Easter Monday, Whit-Monday, August 1, October 20; Spalding, April 27, June 29, August 26, September 25, Wednesday before December 6; Spilsby, Monday before Whit-Monday, Monday after ditto, Monday fortnight after Whit-Monday if it fall in May (if not, there is no fair), first Monday in July, old style; Stamford, Tuesday before February 13, Monday before Midlent, Midlent Monday, Monday before May 12, Monday after Corpus Christi, August 5, November 8; Stow Green near Sleaford, July 4; Swineshead, first Tuesday in June, October 2; Tattershall, May 15, September 25; Wainfleet, third Tuesday in May, July 6, August 24, October 24; Winteringham, July 14; Wragby, Holy Thursday, September 29.

Divisions, Towns, &c.—Lincolnshire has long been divided into three 'parts,' as they are termed, Lindsey, Kesteven, and Holland. Lindsey, which is mentioned by Bede under the name Lindissi, and in the Saxon Chronicle by the names Lindissi, Lindesse, and Lindesige, is by far the largest, and comprehends all that part of the county which lies north-east of a line drawn from Clifton-upon-Trent, partly along the Foss Dyke, to Lincoln (which city, with a small territory to the south-west, is included in it), thence by the Witham to near Boston, and from just above that town south-eastward to the sea between Boston and Wainfleet. The name Lindsey, like that of the county, is derived from Lindum, the Roman name of Lincoln. From the name, with the subjoined epithet Colonia, came Lincoln,* and thence Lincolnshire; and from the name without the epithet Lind-sey. The latter part of this name appears to be the Saxon 'ey,' an island; 'the Isle of Lindum,' a name sufficiently descriptive of the district, which is insulated by the sea, the Humber, and the Trent, the Foss Dyke and the Witham, with their connected marshes.

Kesteven comprehends the south-western part of the county; it extends on the north and north-east to the Foss Dyke and the Witham, except just about Lincoln, where Lindsey encroaches upon these boundaries. It is bounded eastward by a line drawn south from the Witham, at the junction of the Kyme, or Sleaford river, to the Welland, between Deeping and Croyland. The origin of this name is very obscure.

Holland, called by Ingulphus Hollandia, comprehends the rest of the county, including the greater part of the fens. The name appears to be derived from the Saxon holl, 'a hole or hollow,' a name not inappropriate to the fen district, forming, as it does, a vast basin in the midst of surrounding higher ground; or perhaps from Holt, 'a ditch,' (another form of the same word), an epithet equally appropriate.

These divisions are of great antiquity; they are also characterized by distinct natural features. The insular character of Lindsey has been noticed; the Wolds, or chalk hills, form the nucleus of it. Kesteven is distinguished by the steep slope of the Cliff Row, which overlooks the valley of the Witham; and Holland, like its continental namesake, is distinguished by its fens.

Lincolnshire is further divided into wapentakes, hundreds, and sokes. These, with their situation in the county, their chief town, area, and population in 1831, are as follows:—

I. Parts of Lindsey.			Area.	Pop. 1831.
Aslacoe, wapentake	Central	(no town)	43,240	4,820
Bolingbroke, soke	Central	Spilsby	49,980	11,119
Bradley Haverstoe, wapentake	N.E.	Grimsby	66,430	11,919
Calcewarth, hundred	E.	Alford	56,670	10,266
Candleshoe, wapentake	E.	Wainfleet	62,040	8,518
Corringham, wapentake	N.W.	Gainsboro'	46,250	13,183
Gartree, wapentake	Central	Tattershall	54,040	6,963
Hill, hundred	Central	(no town)	24,070	3,420
Horncastle, soke	Central	Horncastle	24,790	8,646
Lawress, wapentake	E.	(no town)	46,570	7,249
Louth Eske, hundred	N.E.	Louth	70,190	14,027
Ludborough, wapentake	N.E.	(no town)	12,610	1,430
Manley, wapentake	N.	Epworth	131,560	24,045
Walshcroft, wapentake	Central	Market-Rasen	57,220	7,618
Well, wapentake	E.	(no town)	19,440	3,194
Wraggoe, wapentake	Central	Wragby	55,060	6,322
Yarborough, wapentake	N.	Barton	117,270	19,487
Lincoln, city and liberty	Central		17,660	11,943
Total of parts of Lindsey			921,620	173,085
II. Parts of Kesteven.				
Aswardhurn, wapentake	Central	(no town)	45,250	6,467
Aveland, wapentake	S.	Bourn	53,320	9,078
Beltisloe, wapentake	S.	Corby	53,170	6,430
Boothby Graffo, wapen.	W.	(no town)	56,250	7,843
Flaxwell, wapentake	Central	Sleaford	37,410	6,015
Langoe, wapentake	Central	(no town)	64,070	7,558
Loveden, wapentake	W.	(no town)	47,240	7,963
Ness, wapentake	S.	Stamford	31,650	12,707

Kirton, wapentake	S.E.	Swineshead	71,860	14,777
Skirbeck, wapentake	S.E.	Boston	26,190	18,456
Total of the parts of Holland			256,370	62,547
Total of the county		.	1,663,850	317,465

The county contains the city of Lincoln, the boroughs and market-towns of Boston, Grantham, Grimsby, and Stamford; and the market-towns of Alford, Barton-upon-Humber, Bolingbroke, Bourne, Caistor, Corby, Crowle, Deeping, Donington, Epworth, Falkingham or Folkingham, Gainsborough, Glandford Bridge or Brigg, Holbeach, Horncastle, Kirton, Louth, Market Rasen, Sleaford, Spalding, Spilsby, Swineshead, Tattershall, Wainfleet, and Wragby. To these may be added the now disused market-towns of Binbrook, Burton-upon-Stather, Crowland or Croyland, Navenby, and Saltfleet. Of some of these an account is given elsewhere. [AXHOLME; BARTON-UPON-HUMBER; BOSTON; GAINSBOROUGH; GRANTHAM; STAMFORD.]

Lincoln is on the north bank of the Witham, just at the place where it passes through an opening in the stonebrash hills, 124 miles from London, through Ware, Biggleswade, and Peterborough. It was a place of considerable importance under the Romans. In the time of the Saxons it was also a place of consequence; and notice of it occurs in the struggles of the Saxons and Danes. At the time of the Conquest it was one of the most important places in the kingdom, and the emporium of a considerable trade. William the Conqueror ordered the erection of a strong castle here A.D. 1086. The erection of this castle is said to have caused the demolition of two hundred and forty houses. At the time of the Domesday survey there were in Lincoln 1070 houses and 900 burgesses. The prosperity of the place appears to have been further promoted in the time of Henry I. by clearing out the Foss Dyke, and making it again available for navigation. This inland communication, with the advantage of the navigation (probably a tideway navigation for sea-borne vessels) of the Witham, rendered the situation of Lincoln peculiarly favourable for commerce. In the reign of Stephen the empress Maud was besieged here by the king, who took the city, but the empress escaped. The castle was shortly after surprised by some of her partisans, and being besieged by the king, who had the townsmen in his interest (A.D. 1141), was relieved by the approach of Robert earl of Gloucester, natural brother to the empress. Stephen, upon the approach of the relieving force, gave battle to it; but, by the desertion of Alan earl of Richmond, he was defeated and taken after fighting with the greatest intrepidity.

---

* Variously written by the Saxons, Lincol, Lincola, Lincolne, Lincylne [illegible] and Lincylne.

In the civil wars of the reign of John the town was taken by Gilbert de Gaunt, one of the barons in the interest of Louis, Dauphin of France, who had created him earl of Lincoln. The castle however held out for the king and was besieged by Gilbert, who hearing that John was approaching from Norfolk, retreated from the place. John however having lost his baggage in the Wash, and died of grief, Gilbert retook the town and reinvested the castle. The earl of Pembroke, regent during the minority of Henry III., advanced to relieve it, and Fulk de Brent, a chieftain of the king's party, threw himself with a reinforcement into the castle. The besiegers, who were supported by a body of French, were attacked on both sides; and the town, in which they attempted to defend themselves, was stormed by the earl of Pembroke. The count of Perche, commander of the French, was slain; many of the insurgent barons and other prisoners of rank were taken, and the party of the Dauphin was crushed. The battle was fought June 4, 1218. At a subsequent period the castle was in the hands of John of Gaunt, son of Edward III., who greatly improved it.

In the civil war of Charles I. the inhabitants promised to support the king, but in A.D. 1643 the city was in the hands of the parliamentatians, who had a garrison here. The royalists attempted by treachery to possess themselves of the place; but the plot was discovered, and the cavaliers who had broken in were repulsed. They got possession of the city however soon after; and in 1644 the parliamentary army under the earl of Manchester attacked the city and took the lower part of it. The royalists retreated to the cathedral and the castle, which were stormed, in spite of a gallant resistance, on the night of May 5th, two days after the earl's arrival before the place.

The city is built on the southern slope and at the foot of a hill, on the summit of which is the cathedral. It contains twelve parishes, and part of a thirteenth, the remainder of which, with two others, are locally within the limits, though not in the jurisdiction of the city. There are four parishes in the liberty of the city, on the opposite side of the river: the area of the city cannot be given separately: the city and liberty, and the included parishes, contain altogether 17,560 acres. The town is irregularly laid out; the principal street is along the road from London to Barton-on-Humber, which extends right through the place, crossing the Witham by a bridge, and running up the hill on which the cathedral stands. This street also extends a considerable length south of the Witham. The streets are paved, lighted with gas, and supplied with water from public conduits or fountains. There are several small bridges over the Witham or over the drains or dykes near the city. The high bridge over the Witham has one arch of nearly 22 feet span, and 11 feet high; it is considered to be at least five hundred years old. There are market-places or market-houses for corn, cattle, meat, and butter, in different parts of the city; the fish-market is held near the high bridge.

The most interesting of the public buildings is the cathedral, which is advantageously situated on the summit of the hill, and may be seen for many miles across the flat country to the south-east or south-west · its three towers have at a distance a very fine effect. It has been erected at different periods, and combines, in consequence, various styles of architecture: the predominant style is the early English, of a remarkably rich and beautiful character. The cathedral may vie with any, and has been by some judges preferred even to York. It is much enclosed by buildings on the north, south, and west sides; but is more open on the east. The nave is very fine, and the piers in this part are peculiarly rich; and though the side aisles are unusually narrow, the effect of the whole is excellent. The western front, which embraces the width of the nave and aisles with the side chapels (or, as some term them, transepts) at the west end, is partly Norman, partly early English: it has two towers whose height from the ground is 180 feet. There were formerly spires upon these, of the height of 101 feet, but these were taken down thirty years ago; there are still pinnacles at the corners of the towers. At each angle of the west front are octagonal staircase turrets crowned with pinnacles. There are three west doorways, the centre one opening into the nave, the side ones into the two side aisles. There is much sculpture and tracery on this front in excellent preservation; and over the central doorway are several statues of the kings of England, from the Conquest to Edward III., under decorated canopies. The central or great transepts are chiefly in the early English style; they have aisles on the eastern side, which are divided into rooms, used as vestries or chapels. There are at the ends of the transepts circular windows; that at the end of the south transept is one of the finest circles in the early English style remaining. The 'Galilee court,' or porch attached to the west side of the south transept, and the chapels on the east aisle of the same, are particularly deserving of attention for the intricacy and beauty of their mouldings, and the singularity and excellence of their general composition. At the intersection of these transepts with the nave and choir is the central tower, 53 feet square, with pinnacles at the corners. The windows of this tower are rather small, which circumstance renders the lantern obscure. The height of this tower from the ground to the summit of the pinnacles is about 300 feet. The choir is of richer and more elaborate composition than the nave and transepts; though. like them, it is of early English character. It is separated from the nave by a rich stone screen.

The eastern end of the choir, with the Lady Chapel, is of a transition style between the early and decorated English, of peculiar beauty and interest. The east window, of eight lights, is a fine composition. The cathedral is at this end less encompassed with buildings; a better view of it can consequently be obtained. There are two transepts to the eastward of the principal transepts, and there are several chapels in different parts. The dimensions of the cathedral are as follows:—Exterior length of the church within its buttresses 524 feet; interior length 482 feet; width of the cathedral (interior width, we believe, of the nave and choir with their respective aisles) 80 feet; height of the vaulting of the nave 80 feet; width of the western front 174 feet. Exterior length of the principal transept 250 feet, interior 222 feet; width 66 feet. Smaller or eastern transept—length 170 feet; width, including the side chapels, 44 feet. The dimensions are, we believe, when not otherwise specified, interior dimensions.

The old bell, called the Tom of Lincoln, which was cast in 1610, and hung in the northernmost of the west towers, became cracked in 1827, and being broken up in 1834, with six other bells, was recast into the present large bell and two quarter bells by Mr. Thomas Mears of London, and placed in the Rood (or central) tower in 1835. The new bell, which is larger and heavier than the old one, is 6 feet 10¼ inches in diameter at the mouth, and weighs 5 tons 8 cwt.: the old one weighed nearly a ton less, viz. 4 tons 14 cwt. The new bell is more musical than the old one, but not nearly so loud and sonorous. It is the third bell for size in the kingdom; being exceeded only by 'Mighty Tom' of Oxford (7 tons 15 cwt.) and 'Great Tom' of Exeter (6 tons).

On the north side of the cathedral are the cloisters with the chapter-house. The cloisters enclose a quadrangle of 118 feet by 91: three sides remain in their original state, and are of good decorated work; over the fourth (the north) side is a library built by Dean Honeywood in the latter part of the seventeenth century. The library contains a collection of books, with some curious specimens of Roman antiquities. In the enclosure of the cloisters, some feet below the surface, is a handsome tessellated pavement.

From the eastern side of the cloisters is the entrance to the chapter-house, a lofty and elegant decagon, with a groined roof supported by a central pillar. Though not equal to the chapter-house of Salisbury, it is very fine. Its interior diameter is 60 feet 6 inches.

The cathedral contains numerous monuments; but many more, which formerly existed, have been removed or totally destroyed. Many were defaced or pulled down at the Reformation, or by the parliamentary soldiers in the great civil war; and many were disarranged when the floor of the cathedral was newly paved in A.D. 1782, or when subsequent alterations were made in the nave and choir. Among other tombs are those of Catherine Swynford, duchess of Lancaster, wife of John of Gaunt; of Joan countess of Westmoreland, their daughter; and of several bishops and deans of the cathedral.

The officers of the cathedral are the bishop, dean, precentor, chancellor, subdean, six archdeacons, fifty-two prebendaries, four priest-vicars, five lay-clerks or singing-men, an organist, seven poor clerks, four choristers, and six burghersh chanters. The net yearly revenue of the bishopric is 4542*l.*; the net yearly income of the cathedral, divided between the dean, precentor, chancellor, and subdean, is 6936*l.*; these dignitaries have residences. On the south side of the cathedral are the ruins of the bishop's palace, which was demolished during the civil wars. The shell of the magnificent hall, eighty-four feet by fifty feet, supported by two rows of pillars, a gateway, and part of the kitchen wall, remain. A modern house has been built on part of the site, in which the bishop resides when at Lincoln. The deanery is an antient building; and near it is another antient building, called 'the Works Chantry,' formerly the residence of the chancellor of the diocese. The vicar's college once formed a quadrangle, of which at present there remain only four houses inhabited by the vicars. There is an antient gateway yet standing.

The see of Lincoln was originally at Dorchester on the bank of the Thames. The see of Dorchester is said to have been founded A.D. 625 or 636. The dioceses of Leicester and Sidnacester (probably Stow, between Lincoln and Gainsborough), the latter of which comprehended the parts of Lindsey, were added to it; and in the eleventh century (A.D. 1057, or 1072, or 1088, for accounts vary) the seat of the bishopric was removed to Lincoln. Although the dioceses of Ely (in the twelfth century), Oxford and Peterborough (in the sixteenth century, at the Reformation), were taken out of it, it is still the most extensive diocese in the kingdom. It is divided into six archdeaconries: 1, Lincoln; and, 2, Stow, which two comprehend the county of Lincoln; 3, Leicester, which includes Leicestershire; 4, Bedford, which includes Bedfordshire; 5, Huntingdon, which includes Huntingdonshire and part of Hertfordshire; and, 6, Buckingham, which includes Buckinghamshire. Considerable alterations are however to be made, in conformity with the act 6 and 7 Will. IV., c. 77. The counties of Huntingdon and Bedford are to be transferred to the diocese of Ely; the county of Buckingham is to be transferred to the diocese of Oxford; the county of Leicester to the diocese of Peterborough; and the part of Hertfordshire to that of Rochester. Of the present diocese only the county of Lincoln is to remain, but to this is to be added the county of Nottingham transferred from the diocese of York. A fit residence is to be erected for the bishop, whose average income is to be from 4000*l.* to 5000*l.*

The parish churches of Lincoln are twelve in number; formerly there are said to have been fifty or more, most of which were standing at the time of the Reformation. The present churches are mostly small and much mutilated. Four or five churches south of the Witham have Norman towers. An additional church is about to be built by subscription.

The remains of the castle stand on the hill, west of the cathedral: they consist chiefly of the outer walls and the gateway tower. The site of the castle is occupied by the county gaol and court-house, which were rebuilt a few years ago in a handsome style by Sir R. Smirke. In one corner of the area is a small building, 'Cob's Hall,' supposed to have been a chapel; and in one part of the outer wall, on the north side, are the remains of a turret in the line of the Roman wall of Lincoln, in which is a gateway apparently Roman and supposed to have been one of the gates of that station or to have belonged to a building more antient than the castle.

Lincoln abounds in monastic and other remains of antient architecture. There are several antient gateways, as the Exchequer or Exchequer Gate in the Cathedral Close, and the Stonebow in the High-street; the remains of a fort called 'Lucy Tower;' a tower of three stories, incorporated in a modern house called 'the Priory,' and several other buildings. 'The Grey Friars' is a large oblong building, the lower story of which is occupied as a spinning-school, and lies some feet below the surface of the ground; part of the upper story, formerly the chapel, is now used for a free school, and the remaining part as a library. The remains of John of Gaunt's Palace and of a building called John of Gaunt's Stables present some interesting Norman and early English features. In the gable of the palace is a beautiful oriel window.

The population of the city and liberty, in 1831, was 11,843, to which may be added that of the three parishes locally included, 1360; together, 13,203. The chief trade is in flour, which is sent to Manchester and London, and there are some extensive breweries noted for their ale. There are now eight or ten steam-engines in the city; a few years ago there was not one. The county assizes and the election for the northern division of the county, and quarter-sessions for the city and liberty, are held here. There are a race-course, a theatre, and assembly-rooms.

There are several dissenting places of worship, several public libraries, two news-rooms, a flourishing mechanics' institute, and several book-societies. There are a general dispensary, a lunatic asylum, a county hospital, a lying-in hospital, and several other charitable institutions.

Lincoln was incorporated by charter of Henry II., but the governing charter was that of Charles I. By the Municipal Reform Act the city is divided into three wards, and has a mayor, six aldermen, and eighteen councillors. The guildhall is an antient Gothic building; the court-house for the city is modern; the gaol is not large enough to admit of the proper classification of prisoners.

The city returns two members to parliament: it first exercised this privilege in the reign of Henry III. The parliamentary constituency, in 1833, consisted of 603 freemen and 521 ten-pound householders: total, 1124. The parliamentary borough comprehends the city and a small portion of the liberty.

There were in the city, in 1833, two infant-schools, with 322 children; five dame-schools, with 67 children; thirty-two day-schools (including two endowed schools, with 80 children), with 776 children; four boarding and day schools, with 150 to 160 children; one national school, with 474 children; and seven Sunday-schools, with about 790 children. There were at the same time in the liberty, one boarding-school, with 30 to 40 children; six day-schools (three of them partly or wholly supported by subscription), containing 246 children; and five Sunday-schools, with 328 children.

Grimsby is in the wapentake of Bradley Haverstoe, in the parts of Lindsey, on the south bank of the Humber, near its mouth. In the time of Edward III. Grimsby was of sufficient importance to furnish the king with eleven vessels and 170 mariners for his armament against Calais. The gradual blocking up of the harbour by the accumulation of mud and sand led to the decay of the port, until it was renovated by the spirited exertions of some of the neighbouring landed proprietors about the beginning of the present century. The landing at low water is however still very bad, and a jetty is now erecting to remedy this inconvenience. The parish of Grimsby, the township of Clee, and the hamlet of Weelsby, comprehend 2110 acres, and had in 1831 a population of 4225, of which a small proportion is agricultural. The town consists of two parts: the older part of the town is irregularly laid out, and is at the head of the harbour, about a mile from the sea; the new part, commonly called 'the Marsh,' consists of three streets parallel to the harbour, on the east side. The harbour, which is a tide harbour, with a lock, &c., is at one of the mouths of the Laceby Beck, extending inland about a mile southward from the sea: vessels drawing sixteen feet can enter it with high-water neap tides. There are large warehouses and timber-yards attached to the harbour. The town formerly consisted of two parishes now united. The church of St. James, now the only one, is a large cross church, with a tower in the centre; the architecture is in a great degree early English; the west door is Norman. There are in the church some antient monuments and inscriptions, and a large font of early English character. There is a small ill-managed borough gaol. There are a tan-yard, two bone-mills, some corn-mills, and a large ropery for making patent cordage of phormium tenax, which has not been very successful. The market is on Friday.

Grimsby is a borough by prescription; the council under the Municipal Reform Act consists of four aldermen and twelve councillors. The parliamentary borough, which was considerably enlarged by the Boundary Act, includes, besides the municipal borough, the rest of the parish of Grimsby, and the parishes of Great Coates, Little Coates, Bradley, Laceby, Waltham, Scartho, and Clee, with the township of Cleethorpe, containing an additional population of 2364; making in all 6589. Clee has an antient church, with some fine Norman piers and arches.

The living of Grimsby is a vicarage, in the archdeaconry of Lincoln, of the clear yearly value of 532*l.* There are several dissenting places of worship.

There were in the parish, in 1833, one infant school, with 20 children, partly supported by the corporation; a grammar-school, with 60 boys and 20 girls; a school preparatory to the grammar-school, with 54 boys and 19 girls; and a school for dissenters, with 22 children: the first two of these schools were wholly and the third partly supported by the corporation: four other day-schools, with 114 children; one boarding-school, with 23 children; and one Sunday-school, with 110 children.

Alford is in the hundred of Calceworth, in the parts of Lindsey, 140 miles from London by Boston and Spilsby, and near the head of a small stream which flows into the sea. The parish contains 1410 acres, with a population, in 1831, of 1784, about one fourth agricultural. The town consists chiefly of one street. The church is an insignificant building. There are one or two dissenting meeting-houses. The market is on Tuesday. The living is a vicarage, united with the chapelry of Rigsby, in the archdeaconry of Lincoln, of the clear yearly value of 122*l.* There were, in 1833, an endowed grammar-school, with 24 boys; a national school, with 128 children; and five other day and boarding schools, with 190 children.

Bolingbroke is in the soke of Bolingbroke, in the parts of Lindsey, 133 miles from London, by Boston. There was here an antient castle, built by William de Romara, earl of Lincoln, which afterwards came into the hands of the Lacy family, and subsequently into those of John of Gaunt. Henry IV., son of John, was born in this castle, and took from it his surname of Henry of Bolingbroke. There are a few remains, consisting chiefly of the tower at the south-western angle of the castle, which was quadrangular. The parish comprehends an area of 2570 acres, with a population of 725. There is a small manufactory of earthenware. The market is on Tuesday. The church, which is antient, was partly destroyed in the civil wars of Charles I. The living is a rectory, united with the chapelry of Hareby, both in the archdeaconry of Lincoln, of the clear yearly value of 373*l.* There were in the parish, in 1833, one endowed and one other day-school, with 46 children, and one Sunday-school, with 40 children.

Bourn is in Aveland wapentake, in the parts of Kesteven, on the road from London to Lincoln, 97 miles from the former, and 36 from the latter. There was formerly a castle here, which was the seat of a lordship of some note in the Saxon times. Hereward, the Anglo-Saxon chieftain who opposed the most protracted resistance to the Norman conquerors, was the son of the lord of Bourn, or Brunne. The parish comprehends 8190 acres, with a population of 2569: it is divided into three hamlets, of which that of Bourne, with Tongue-End, contains a population of 2355, nearly one-half agricultural. The town consists chiefly of one long street of modern well-built houses. In the centre of the market-place is an antient town-hall, said to have been built by the great Lord Burghley, a native of the town; the lower part is used as a market-house. The church is large, but appears to be only part of a more extensive plan. The piers and arches of the nave are of Norman, the clerestory of perpendicular date. At the west end, portions in the perpendicular style have been ingrafted upon others of an early English character. There are two towers at this end. Wool-stapling and tanning are carried on, and the the town has some trade in leather and wool: there is a navigable canal communicating with the river Glen. A tesselated pavement and some Roman coins have been dug up in the neighbourhood, and there are the traces of the site of an Augustinian priory, the revenue of which at the Dissolution was 197*l.* 17*s.* 5*d.* gross, or 167*l.* 14*s.* 6*d.* clear. There are some dissenting places of worship. The living is a vicarage, in the archdeaconry of Lincoln, of the clear yearly value of 320*l.*, with a glebe-house. There were, in the year 1833, in the parish, one dame-school, with 20 children; an endowed school, with 18 boys; a national school, with 126 children; nine other day-schools, with 167 children; and two Sunday-schools, with 169 children.

Caistor, or Castor, is in the wapentake of Yarborough, in the parts of Lindsey. Its name indicates it to have been a Roman station: by the Saxons it was called Thong Castor. Some Roman and Saxon antiquities have been discovered here. The whole parish, which extends into the wapentake of Walshcroft, contains 4470 acres, with a population of 1525: the chapelry of Holton-le-Moor contains 1750 acres, with a population of 150, leaving for the part of the parish which contains the town 2720 acres and 1375 inhabitants, of whom about a sixth are engaged in agriculture. The church is partly of Norman, partly of early English character. The town has a market on Saturday. The living is a rectory, united with the chapelries of Houghton and Clixby, exempt from the archdeacon's jurisdiction, of the clear yearly value of 215*l.*, with a glebe-house. There were in the parish (exclusive of Holton chapelry), in 1833, an endowed day-school, with 74 children; eight other day-schools, with 194 children; a national Sunday-school, with 144 children; and another Sunday-school, with 70 children.

Corby is in the wapentake of Beltisloe, parts of Kesteven, 105 miles from London by Bourne. The parish comprehends 3790 acres, with a population of 654, above half agricultural. The market, which has almost fallen into disuse, is on Thursday. The living is a vicarage, united with the rectory of Irnham and the chapelry of Bulby, all in the archdeaconry of Lincoln, and of the joint yearly value of 608*l.*, with a glebe-house. There were in Corby parish, in 1833, an endowed free-school, with from 10 to 25 scholars; two other day-schools, with 38 children; and one Sunday-school, with 82 children.

Deeping, distinguished from some neighbouring places of the same name as Market Deeping, is in the wapentake of Ness, in the parts of Kesteven. It is 90 miles from London, on the road to Lincoln. The parish comprehends 1290 acres, and had in 1831 a population of 1091. The houses are mostly old and ill built. The market is on Thursday. Some trade is carried on by the Welland. The church contains some traces of Norman and some portions of early English architecture; the tower and other parts are of perpendicular character. The living is a rectory of the clear yearly value of 579*l*, with a glebe-house. There were in 1833 an endowed day-school with 70 scholars; six other day-schools with 173 children; and one Sunday-school, supported out of the poor-rates, with 80 children.

Deeping St. James is a village so near to Market Deeping as almost to constitute one town with it. The parish has an area of 6470 acres, with a population of 1587. The church, originally a chapel, built by the monks of Croyland, is large and curious, chiefly in the Norman and early English styles: it contains a curious Norman font. There is an antient stone cross in this village. The living is a vicarage of the clear yearly value of 191*l.*, with a glebe-house. There were in 1833 three day-schools with 85 children; a national school with 100 children; and a Sunday-school with 64 children.

Donington is in the wapentake of Kirton, in the parts of Holland. It is 110½ miles from London, on the left of the road to Boston. The parish comprehends an area of 6180 acres, with a population in 1831 of 1759, more than half agricultural. Hemp is grown in the neighbourhood to a great extent; and much hemp-seed is sold. The church is dedicated to St. Mary and the Holy Rood; there are one or two Dissenting places of worship. There is a market on Saturday. The living is a vicarage in the archdeaconry of Lincoln, of the clear yearly value of 126*l.*, with a glebe-house. There were in the parish in 1833 four dame-schools with 28 children; four endowed day-schools with 315 children; and one Sunday-school with 20 children.

Falkingham, or Folkingham, is in the wapentake of Aveland, in the parts of Kesteven, 106 miles from London on the road to Lincoln. Here was antiently a castle on the eastern side of the town, but only the moats and mounds remain. The parish comprehends 1700 acres, and had in 1831 a population of 744, above half agricultural. The streets are clean and well paved. The church is large and handsome clusters of perpendicular character; the tower has eight pinnacles and a rich battlement. A small gaol was erected thirty years ago on the site of the ancient castle and has been since enlarged. The market is on Thursday. The living is a rectory united with the vicarage of Laughton, both in the archdeaconry of Lincoln, of the clear yearly value of 511*l.* There were in the parish in 1833 an endowed day-school with 30 children; four other day-schools with 62 children; one boarding and day school with 36 children; and one Sunday-school with 131 children.

Glanford-Brigg, or Glanford-Bridge, or by familiar abbreviation Brigg, is in the wapentake of Yarborough, in the parts of Lindsey, 23 miles from Lincoln, and 156 miles from London on the road to Barton-upon-Humber. The chapelry of Glanford-Brigg is in the parish of Wrawby with Kettleby, which comprehends 3070 acres, and had in 1831 a population of 2418, of whom 1780 were in Glanford chapelry. The town is advantageously situated a short distance to the east of the Ancholme navigation, by means of which a considerable trade is carried on in corn, coal, and timber. Besides the Episcopal chapel there are Dissenting and Catholic places of worship. The market is on Thursday. The chapelry is annexed to the vicarage of Wrawby, which is in the archdeaconry of Lincoln, of the clear yearly value of 224*l.*, with a glebe-house. There were in 1833 in the chapelry three dame schools, with about 50 children; an endowed day-school with 21 children; four other day-schools with 196 children; one boarding and day school with 64 children; and three Sunday-schools with 287 children.

Holbeach is in the wapentake of Elloe, in the parts of Holland, 109 miles from London, a few miles to the right of the road to Boston. The parish comprehends an area of 20,110 acres, with a population in 1831 of 3890, chiefly agricultural. The town is indifferently built and is in a low marshy district. The church is a large and handsome building, consisting of a nave, chancel, aisles, and square tower, surmounted with an ornamental octangular spire. The market is held on Thursday. The living is a vicarage in the archdeaconry of Lincoln, of the clear yearly value of 797*l.* There were in 1833 an endowed day school with 101 children; a day-school, partly supported by subscription, with 40 children; nine other day-schools with 342 children; and three Sunday schools with 275 children.

Horncastle is in the soke of Horncastle, in the parts of Lindsey, 136 miles from London by Sleaford and Tattershall. It is supposed to have been a Roman station; some think that it was the Banovallum of Ravennas. There are traces of a fortification yet visible, which was a parallelogram enclosing an area of twenty acres, and comprehending a considerable part of the modern town. Roman coins and other antiquities have been discovered, and at the point formed by the junction of the Waring and the Bain is an intricate circle or labyrinth called Julian's Bower. The name Horncastle is derived from the Saxon word *hyrn*, a corner, and is descriptive of the situation of the place in the angle formed by the junction of the above-mentioned rivers. The town, which is pleasantly situated at the foot of the Wolds, has been much improved, and consists of respectable well-built houses. The church has been in great part rebuilt of late years. Part of it is as ancient as the time of Henry VII. There are several Dissenting meeting-houses. Corn and wool are the principal articles of commerce, which has been much promoted by the opening of the Horncastle navigation from this town to the Witham. The market is held on Saturday, and there are three fairs in the year, one of them probably the largest horse-fair in the kingdom. The area of the parish is 2510 acres; the population in 1831 was 3988, about one-tenth agricultural. The living is a vicarage in the archdeaconry of Lincoln, of the clear yearly value of 612*l.*, with a glebe-house. There were in 1833 three dame-schools with 38 children; a Lancasterian school with 145 children; one national day and Sunday school with 223 day scholars, and 129 on Sundays; thirteen other day-schools with 331 children; two boarding and day schools with 64 children; and two Sunday schools with 185 children. There were two endowed schools (one a grammar-school) from which no return was made. There are two public libraries, a subscription library of 1000 volumes, and a clerical library.

Kirton (distinguished as Kirton in Lindsey from another place of the same name in the parts of Holland) is in the wapentake of Corringham, in the parts of Lindsey, about 152 miles from London to the left of the Barton road. It is situated on the slope of that range of hills which extends from Lincoln to Barton-upon-Humber and overlooks the valley of the Trent. The parish comprehends 4510 acres, with a population in 1831 of 1580, more than one-third agricultural. The quarter sessions for the parts of Lindsey are held here by adjournment; and there are a court-house and house of correction. There is a market on Saturday. The church is large and has a considerable portion of good early English work; there are meeting-houses for Methodists and Baptists. The living is a vicarage in the archdeaconry of Stow, of the clear yearly value of 249*l.* There were in the parish in 1833 an infant-school with 50 children; an endowed national day and Sunday school, with 104 children in the week, and 100 on Sundays; nine other day-schools with 135 children; and one Sunday-school with 90 children.

Louth is in the hundred of Louth Eske, in the parts of Lindsey, 148 miles from London by Boston and Spilsby. There were anciently three religious establishments (two 'guilds' and a 'chantry'), the funds of which are now appropriated to the grammar-school. The parish comprehends an area of 3620 acres, with a population in 1831 of 6976, about one-eighth agricultural. The town is in a pleasant situation at the eastern foot of the Wolds, and on the bank of the little river Lud, over which there is a bridge. It is well built; the houses are of brick, and the streets are well paved and lighted. The church is one of the finest in the county; it consists of a nave, chancel, and two aisles, with a lofty and elegant tower, surmounted by a rich octangular crocketed spire, at the west end. The exterior presents a fine specimen of perpendicular architecture; the east window is remarkable for its beautiful tracery. The angles of the tower are supported by rich buttresses which terminate in octangular crocketed pinnacles; there are flying buttresses from the spire to these pinnacles. The height of the spire is 288 feet. The grounds of the vicarage-house are curiously laid out as if attached to a hermitage, and are interspersed with cells, chapels, and other appropriate buildings. There are a session-house and a house of correction for the division; a modern guildhall; an assembly-room; a small theatre; and a public subscription library and news-room. There are some manufactories of worsted, carpets, rugs, and blankets, which give employment to about 180 people; a soap manufactory, a paper-mill, and breweries. Trade is carried on in wool and corn. The Louth navigation extends from the town to the ocean just at the mouth of the Humber. The markets are on Wednesday and Saturday, and there is a weekly market for cattle on Friday during the spring. The quarter-sessions for the division are held alternately here and at Spilsby. The town was incorporated by Edward VI.; by the late Municipal Reform Act it was divided into two wards and has 6 aldermen and 18 councillors. The borough is coextensive with the parish. The living is a vicarage in the archdeaconry of Lincoln, of the clear yearly value of 305*l.*, with a glebe house. There are several Dissenting places of worship. There were in 1833 an infant-school with 130 children, a dame-school with 30; a free grammar-school, with a large endowment, with 82 children; another endowed day-school with 25 children; thirteen other day schools with 372 children; a national day and Sunday school with 254 scholars during the week, and 52 on Sundays; and three Sunday-schools, with 480 children.

Market-Rasen, or Rasin, is in the hundred of Walshcroft, in the parts of Lindsey, on a little brook, the Rase or Rasin, which joins the Ancholme, nearly 149 miles from London by Lincoln. The parish comprehends 1270 acres, and had in 1831 a population of 1428, about one-sixth agricultural. The parish-church is commodious. The Roman Catholics and Methodists have meeting-houses; there is an hospital or almshouse for four poor men. The market, which is on Tuesday, is well frequented. The Ancholme navigation begins here. The living is a vicarage in the archdeaconry of Lincoln, of the clear yearly value of 92*l.*, with a glebe-house. There were in 1833 ten day-schools (one of them with a small endowment) with 201 children; one boarding school with 8 children; and two Sunday-schools with 262 children.

Sleaford is in the wapentake of Flaxwell, in the parts of Kesteven, 115½ miles from London on the road to Lincoln. It is on the little river Slea, or Sleaford, which flows into the Witham, and is called New Sleaford to distinguish it from the adjacent village of Old Sleaford. Stukely conjectured, but on insufficient grounds, that the Romans had a station here. Roman coins have been dug up. The bishops of Lin

-coln had a castle here, which is now quite levelled with the ground. The parish comprehends 1800 acres, with a population in 1831 of 2450, scarcely any of it agricultural, beside the hamlet of Holdingham, 1360 acres, and 137 inhabitants, chiefly agricultural. The town has been much improved of late years: the streets are paved and lighted. The church consists of a nave with side aisles, and a large chapel or transept on the south side, and another transept on the north, and a chancel without aisles: there is a tower surmounted with a spire rising to the height of 144 feet. The steeple is the most ancient part of the church, and is of early English character, the upper part and the spire being of somewhat later date than the rest: the aisles and the north transept are of decorated character, and the piers and arches of the nave, the clerestory, and the chancel, chiefly of perpendicular date. The west front is very fine: and the design and execution of most parts of the church are excellent. There are some Dissenting places of worship: and a town-hall of modern architecture. The market is on Monday. The Sleaford canal is cut from this town to the Witham. The living is a vicarage, exempt from the archdeacon's visitation, of the clear yearly value of [illegible], with a glebe-house. There were in 1833 in the parish an endowed day-school with 40 children, seven other day-schools with [illegible] children; and three Sunday-schools with 311 children.

Spalding is in the wapentake of Elloe, in the parts of Holland, [illegible] miles from London on the road to Boston. It was a place of some consequence even in the Saxon times. There was a monastic establishment here, which underwent many changes. Its revenue at the dissolution was 878*l.* 18*s.* 3*d.* gross, or 767*l.* 8*s.* 11*d.* clear. The parish comprehends [illegible] acres, with a population in 1831 of 6497, about one-third agricultural. The town is situated on the banks of the Welland, in a fenny district, but well drained; the streets are clean and well paved, and the houses neat. The church, which is mostly of perpendicular character, has a fine tower and crocketed spire. There is a town-hall or court-house, a substantial brick building, in the market-place. There are assembly-rooms and a small theatre. The town derives its principal support from being the emporium for the neighbouring agricultural district. The Welland is navigable for vessels of 40 or 50, or even 70 tons, up to the town, and there is a considerable coasting and carrying trade. The market is on Tuesday, and is very prosperous. Long wool is sent from this neighbourhood for the supply of Norwich and the manufacturing towns of Yorkshire. The living is a perpetual curacy, in the archdeaconry of Lincoln, of the clear annual value of 881*l.*, with a glebe-house. There were in 1833 a free grammar-school with 5 scholars; another endowed free-school for 60 boys; a free-school called 'The Blue-coat-school,' with 50 free and 24 pay scholars; twenty-four other day-schools with 614 children; and five Sunday-schools with [illegible] scholars.

Spilsby is in the soke of Bolingbroke, in the parts of Lindsey, [illegible] miles from London through Boston. The parish comprehends [illegible] acres, with a population in 1831 [illegible] a very small portion was agricultural. The town [illegible] streets meeting in a spacious [illegible]. The [illegible], a plain brick building on [illegible] row of houses in the centre of [illegible] market-cross, a plain octangular [illegible] terminating in a [illegible]. The church is an irregular pile, [illegible] tower of later date than [illegible] several ancient monu- [illegible]. There is a weekly market on Monday. The living [illegible] in the archdeaconry of Lincoln, of the [illegible]. There were in 1833 three dame- [illegible] one day-school, partially endowed, [illegible] a national day and Sunday school, with [illegible] week and [illegible] on Sundays; another na- [illegible] thirty scholars; three other day-schools [illegible], and one Sunday-school with 110 chil- [illegible]

[illegible] in the wapentake of Kirton, in the parts of [illegible] from London, and 7 from Boston. [illegible] a Cistercian abbey here, founded A.D. [illegible] the yearly revenues at the dis- [illegible] gross, or [illegible] 15*s.* 3*d.* clear. [illegible] In this monastery King John [illegible] with his [illegible] Wash, where he lost his baggage. His death, which [illegible] after was by some ascribed to poison administered by a monk of Swineshead. The parish comprehends 6100 acres, and had in 1831 a population of 1994, about half agricultural. Swineshead was formerly a port, and the sea flowed up to the market-place, where there was a harbour. The market is on Thursday, but it is almost disused. The church is a handsome spacious building with a lofty spire. The living is a vicarage, in the archdeaconry of Lincoln, of the clear yearly value of 240*l.* There were in the parish in 1833 an endowed day-school with 90 scholars; six other day-schools with 154 scholars; and one Sunday-school with 75 children. There is in the town a circular Danish encampment, sixty yards in diameter, surrounded by a double fosse.

Tattershall is in the wapentake of Gartree, in the parts of Lindsey, 127 miles from London through Sleaford. It is on the little river Bain, just above its junction with the Witham. Here was formerly a strong castle built by the Fitz-Eudos, barons of Tattershall, and improved by Cromwell, Treasurer of the Exchequer to King Henry VI. The site is marked by two fosses, the outer one of earth, the inner one ten feet deep, faced with brick, and occasionally filled with water from the river. The principal gateway was standing till of late years: a square brick tower built by Treasurer Cromwell is still remaining: it is flanked by octangular turrets which were crowned with spires covered with lead: three of these spires yet remain. The main walls rise to the top of the fourth story, where a capacious machicolation encompasses the tower, on which rises a parapet wall of vast thickness, with arches for the protection of those employed at the machicolations; above this is a second platform with a parapet and embrasures. The tower is in tolerable preservation. The parish comprehends 3840 acres, with a population in 1831 of 599, two-fifths agricultural. The town is much decayed. The church is a beautiful and spacious edifice, in the form of a cross. It has however suffered much from dilapidations. The windows of the choir were glazed with beautiful stained glass, which was removed by a former marquis of Exeter on condition of replacing it with plain glass; but the condition was never fulfilled, and the interior has suffered much from the exposure: a rich carved wooden screen and stalls are nearly rotten. The Horncastle navigation passes through the town: but there is little trade. The market is now held on Thursday. The living is a donative exempt from the archdeacon's visitation, of the clear yearly value of 11[illegible] There were in 1833 a boarding and day school with 25 children; two day schools with 10 or 12 children in each; a national school attended by 104 children in the week and 6[illegible] on Sundays; and one Sunday-school with 18 or 20 children. Mineral waters have lately been discovered at Woodhall between Tattershall and Horncastle, which are coming into repute: handsome baths are built, and an hotel is in course of erection.

Wainfleet is in the wapentake of Candleshoe, parts of Lindsey, 133 miles from London through Boston. It is supposed to have been a Roman station, the Vainonas of the geographer Ravennas. The haven was antiently frequented by ships, but it was going to decay in Leland's time. The waters have been so lowered by a drain, that it is now used only for small craft. The town is supposed to have stood formerly higher up the creek, where the old church of All Saints stands. The parish of Wainfleet All Saints comprehends 1830 acres, with a population in 1831 of 1135, about one-fourth or one-fifth agricultural; that of Wainfleet St. Mary comprehends 6440 acres, with a population of 660, almost entirely agricultural: together 8270 acres, with a population of 1795. All Saints church is a handsome building fast going to decay: it has a brick tower of modern date. St. Mary's church is also much decayed. There is a school-house for the free grammar-school, founded by William of Waynflete, bishop of Winchester, in the fifteenth century. The market is held on Saturday, but is almost disused. The living of All Saints is a rectory, of the clear yearly value of 322*l.*; that of St. Mary is a vicarage, of the clear yearly value of 201*l.*, with a glebe-house; both are in the archdeaconry of Lincoln. There were in 1833, in the two parishes, a dame-school with 16 children; William of Waynflete's free grammar-school, with 42 children; an endowed free-school, supported by the governors of Bethlehem Hospital, with 133 children; nine other day-schools with 222 children; and three Sunday-schools with 387 children: one of the Sunday-schools, with 165 children, was supported by the governors of Bethlehem Hospital. Willion of Waynflete was of this town; his name was William Patten. He founded Magdalen College, Oxford.

Wragby is in the wapentake of Wraggoe, parts of Lindsey, 143 miles from London through Lincoln. The parish comprehends 1710 acres, with a population in 1831 of 591, more than a fourth agricultural. The town is neatly built and pleasantly situated. A handsome new church was built in 1837, by Mr. Turnor, the proprietor of the town. There is a Methodist meeting-house; also an almshouse for six clergymen's widows and six other persons, with a chapel. The market is on Thursday. The living is a vicarage united with the rectory of East Torrington, both in the archdeaconry of Lincoln, and of the joint yearly value of 327*l.*, with a glebe-house. There were in 1833 an endowed day-school with 30 children; another day-school with 28 children; and a Sunday-school with 50 children.

The following places had markets, now disused.—Binbrook is in Walshcroft hundred, parts of Lindsey. It lies in the Wolds between Caistor and Louth, out of any great road. It consists of two parishes, St. Gabriel and St. Mary, having a joint area of 5070 acres, with a population in 1831 of 1016, more than two-thirds agricultural. There are extensive rabbit-warrens in the neighbourhood, and considerable business is done in dressing skins for furriers. The living of St. Gabriel is a vicarage, of the clear yearly value of 75*l.*, exempt from the archdeacon's visitation; that of St. Mary is a rectory, in the archdeaconry of Lincoln, of the clear yearly value of 294*l.* There were in 1833, in the two parishes, four day-schools with 74 children, and two Sunday-schools with 124 children.

Burton, distinguished from other places of the same name as Burton-upon-Stather, is in the wapentake of Manley, parts of Lindsey, 169 miles from London through Newark and Gainsborough. The parish comprehends an area of 3860 acres, with a population in 1831 of 760, three-fifths agricultural. The town was formerly more extensive, but different calamities that have happened to it have combined with the rise of Gainsborough to reduce it; its market has consequently been given up of late years. It is on a hill overlooking the Trent, upon the bank of which there is a wharf. The living is a vicarage united with the rectory of Flixborough, both in the archdeaconry of Stow, and of the joint yearly value of 752*l.*, with a glebe-house. There were, in 1833, five day-schools (one partly supported by a yearly donation), with 130 children; and two Sunday-schools, with 107 children.

Crowland or Croyland is in the wapentake of Elloe, parts of Holland, near the old channel of the Welland, and near the south border of the county, 87 miles from London, through Huntingdon, Ramsey, and Thorney. It is a place of considerable antiquity and interest. It has been conjectured to have been a Roman station; but though various Roman antiquities have been discovered in the neighbourhood, they are not sufficient to support the conjecture. In the time of the Anglo-Saxon kingdoms, a monastery was founded here by Ethelbald, king of Mercia, about the beginning of the eighth century. The first building is said to have been of timber, and, from the marshy character of the soil, was founded upon piles. In or about A.D. 870, in the reign of Ethelred I., this monastery, with several others, was destroyed by the Danes. In the latter part of the eleventh century, the monastery, which had been restored, was again destroyed by fire, but was rebuilt a few years afterwards with funds partly, if not wholly, raised by the sale of indulgences. Five thousand persons are said to have been present at the laying of the first stone; and the abbey, thus restored, increased rapidly in wealth and reputation. At the dissolution, its yearly revenues were estimated at 1217*l.* 5*s.* 11*d.* gross, or 1083*l.* 15*s.* 10*d.* clear. The buildings of the abbey were much injured during the siege of Crowland, which the royalists had fortified, by the parliamentary forces under Cromwell: there are yet standing however considerable remains of the church. This building was originally cruciform, with a central tower, which probably rose little above the roof of the church: there was a campanile tower at the western end of the church. After the dissolution the transepts and choir were pulled down; the nave with its side aisles was left for use as the parish church; but the damage sustained in the civil war led to the church being transferred to the north aisle of the nave; and the centre and south aisle were abandoned to decay, in which state they now remain. The architecture of the existing remains part is of Norman, part of Early English and part of Perpendicular architecture. At the west end of the present church is a massive tower of Perpendicular character: the western entrance to what was the central part of the nave is one of the most beautiful specimens of rich Early English in the kingdom. The groining of the roof of the present church is very good, and the original windows have been fine ones. There are some ancient screen-work and an ancient font. The very foundations of the other conventual buildings have been destroyed.

On the west side of the church is the triangular bridge at the confluence of two streams. There is no record of its erection, but from its style, which is Decorated English, it may be ascribed to the fourteenth century. It consists of three semi-arches meeting in a common centre, and forming by their junction as many pointed arches. The bridge is too steep for carriages, and is little used even for horses. It is supposed to have been designed as a symbol of the Trinity. At one angle of the bridge is the statue of some king much decayed.

The parish comprehends 13,780 acres, with a population in 1831 of 2268, nearly two-thirds agricultural. The village is surrounded by fens, and the inhabitants are engaged in grazing, in the dairy, or in the breeding or taking of geese and wild-fowl. The market has been removed to Thorney. The living is a rectory, in the archdeaconry of Lincoln, of the clear yearly value of 113*l.*, with a glebe-house. There were in 1833 nine dame-schools, with about 100 children; eight day-schools, with 225 children; and two Sunday-schools, with 286 children.

Navenby is in the hundred of Boothby Graffo, parts of Kesteven, on the road from Grantham to Lincoln, 124 miles from London. The church is partly of Early English and partly of Decorated English architecture. The windows of the chancel are very fine specimens of Decorated character, particularly the east window, the mullions and tracery of which are remarkably graceful. The parish comprehends 2110 acres, with a population, in 1831, of 779, above half agricultural. The market, formerly held on Thursday, has fallen into disuse. The living is a rectory, in the archdeaconry of Lincoln, of the clear yearly value of 538*l.*, with a glebe-house. There were in 1833 two dame-schools, with 18 children; two day-schools, with 25 children; and one endowed day and Sunday school, with 109 children in the week and 166 on Sunday.

Saltfleet is in the hundred of Louth Eske, parts of Lindsey, 159 miles from London by Sleaford, Horncastle, and Louth. Saltfleet, half a century ago, was a place of some consequence, but is now decayed and is a mere hamlet in the parish of Skidbrooke. Some of the inhabitants are engaged in the oyster fishery; there is a bank of good oysters off the coast. The parish of Skidbrooke contains 2420 acres, with a population of 262, about half agricultural. The living is a vicarage, in the archdeaconry of Lincoln, of the clear yearly value of 271*l.* There were in 1833 two day-schools, with 52 children, and one Sunday-school, with 58 children.

Divisions for Ecclesiastical and Legal Purposes.—This county, as noticed above, is in the diocese of Lincoln, and constitutes the two archdeaconries of Lincoln and Stow. The intended changes in the diocese have been also given. The archdeaconry of Lincoln is subdivided into the following rural deaneries:—1, Lincoln; 2, Aswardburn, or Aswardburn-cum-Lafford; 3, Aveland; 4, Beltisloe or Beltislaw; 5, Bolingbroke or Bullingbrook; 6, Candleshoe; 7, Calceworth or Calcewarth; 8, Gartree; 9, Grantham; 10, Graffo or Graffoe; 11, Grimsby Hill; 12, Horncastle; 13, Longoboby; 14, Loveden; 15, Lowth-cum-Ludbrook; 16, Ness, or Nesse; 17, Stamford; 18, Walshcroft or Walscroft; 19, Wraggoe or Wraghoe; and 20, Yarborough or Yarburgh. The archdeaconry of Stow is divided into the following rural deaneries:—1, Aslacoe or Aslacke; 2, Corringham; 3, Lawress; and 4, Manley or Manlake. The number of parishes is given by Camden at 630. In Lewis's 'Topographical Dictionary' they are given at 609, of which 305 are rectories, 244 vicarages, and the remainder perpetual curacies, chapelries, or donatives. The diocese of Lincoln is in the ecclesiastical province of Canterbury.

Lincolnshire is in the midland circuit. The assizes are held at Lincoln, where is the county gaol. The quarter-sessions are held as follows: for the county of the city of Lincoln, at Lincoln; for the parts of Kesteven and Holland, the Epiphany, Easter, and Midsummer sessions, at Bourn; the Michaelmas session, at Boston: for the parts of Lind-

[illegible] in Kesteven, and Lindsey; and for the [illegible] the Epiphany and Midsummer sessions at [illegible] Easter and Michaelmas sessions at Louth. [illegible] the Reform Act the county [illegible] with [illegible] and [illegible] members each were returned for the [illegible] Boston, Grantham, [illegible] Stamford.

By the Reform Act the county was [illegible] each returning two members. The [illegible] Lindsey [illegible] and the polling places are [illegible] Horncastle, [illegible] Spilsby. [illegible] Kesteven and Holland [illegible] Boston, [illegible] Sleaford, and Grantham.

[illegible] the time of the Roman [illegible] Lincolnshire constituted part of the territory of the Coritani, [illegible] who occupied several of the midland counties [illegible] Lincolnshire [illegible] the Humber. In the [illegible] which the Romans made of Britain, Lincolnshire was included in the province of Flavia Cæsariensis.

The principal Roman roads or streets which passed through Lincolnshire were Ermine-street, which had two [illegible] the Foss-way, and what has been termed the [illegible] Ermine-street, after passing over an angle of [illegible] near Stamford, [illegible] between Stamford and Grantham [illegible] two branches, of which the more eastern [illegible] Lincoln and [illegible] on the Humber. The other [illegible] The Foss-way commenced on the coast at Grimsby or Saltfleet, or somewhere between them [illegible] Lincoln [illegible] The [illegible] appears [illegible] between the coast of Lincolnshire and [illegible] Two of these [illegible] the eastern branch of Ermine-street and the Foss, were [illegible] by the Romans. There were subordinate [illegible] from these roads, and Dr. Stukeley considers [illegible] there were traces of other Roman roads.

[illegible] the modern Lincoln, was a British town before it was made a Roman station [illegible] at the intersection of [illegible] the eastern branch of Ermine street [illegible] Ptolemy calls it [illegible] and mentions it as one of the [illegible] of the Coritani. It was made a [illegible] and according to Richard a Roman colony, [illegible] of its modern name. The station was on the [illegible] occupied by the cathedral and the [illegible] form was that of a parallelogram, the sides [illegible] cardinal points; on each side was a [illegible] The [illegible] area was 1200 feet by 1300. The walls [illegible] levelled with the ground, and [illegible] the exception, have been long since [illegible] The remaining gate, now called 'Newport Gate,' [illegible] of the most remarkable Roman remains in the kingdom [illegible] of a central arch nearly sixteen feet wide [illegible] with large stones put together apparently without [illegible] the height, according to Stukely, was originally [illegible] two feet, but it is now, from the elevation of [illegible] scarcely more than half that height. On [illegible] the great arch are two lateral arches or posterns, [illegible] up by the elevation of the soil: these [illegible] were each seven feet and a half wide by fifteen [illegible] Adjacent to this gate is a mass of the Roman wall [illegible] and part of the wall are incorporated with the [illegible] and another portion of wall parallel [illegible] the station, and now called 'the Mint Wall,' is supposed to have been part of a granary or of some other [illegible] building. A fortified wall with towers at the [illegible] appears to have run down to the bank of the Witham, [illegible] along the bank; if any part of this remains, it [illegible] so mingled with later Saxon or Norman work [illegible] that it cannot be discriminated. Coins of the [illegible] Nero, Vespasian, and Julian have been found [illegible] and especially of Carausius, who, as some have supposed, resided for a time at Lincoln. A tessellated pavement and a hypocaust beneath it were discovered in A.D. [illegible] the pavement was thirteen feet below the present [illegible] Another hypocaust and several antiquities have been also discovered, especially [illegible] and some [illegible] earthen and [illegible] and other [illegible] remains [illegible] of a set of glazed earthen [illegible] pipes [illegible] other specimens of pottery have been [illegible] found.

The only other Roman station in the county [illegible] in the Antonine Itinerary is Causennæ. Ad Abum, mentioned by Richard of Cirencester, was on Ermine-street, at Winteringham or Whitton, near the [illegible] of the Humber. The Bannovallum and the [illegible] of the anonymous geographer Ravennas have been fixed [illegible] and [illegible] Causennæ was [illegible] Ancaster on Ermine-street, fifteen miles south of Lincoln. Roman [illegible] have been found here. The remains of the station at [illegible] supposed to be Ad Abum, were [illegible] more than [illegible] years before Stukeley wrote [illegible] and [illegible] chimney-pieces, and other antiquities were found, but not preserved. Three [illegible] ments were found here in 1747. At [illegible] Burgh, Stainton, and Brougham [illegible] in the same part of the county, various Roman [illegible] have been [illegible] At Horkstow also, near Winterton, several Roman [illegible] tessellated pavements and [illegible] have been found. At Torksey, at the junction of the Foss Dyke with the Trent, between Lincoln and Gainsborough, there was probably a Roman settlement. The foundations of the ancient Norman castle appear to have been Roman. At Scampton, about six miles north of Lincoln, were discovered in 1795 the foundations of a Roman villa occupying a site [illegible] feet square, and having [illegible] of forty apartments on the ground floor, with [illegible] and [illegible] walls and no less than [illegible] Roman pavements, only one of which was perfect. Some of the walls were of great thickness. Various Roman antiquities were found scattered over the spot. Upon the banks of the Trent, three miles west of [illegible] in the same part of the county, two Roman altars and other antiquities have been discovered. Horsley was inclined to fix the station Segelocum here, on the Lincolnshire side of the stream, instead of placing it at Littleborough on the Nottinghamshire side, where he admits that the town attached to the station stood. [illegible] is supposed to have been the Sidnacester of the Saxons, the seat of a bishopric afterwards transferred to Lincoln. Near [illegible] and at Alkborough, both on the Trent, are Roman camps: the latter was, in Stukely's time, very perfect, and formed a square of [illegible] feet: near it was one of those labyrinths, formed of banks raised here and elsewhere [illegible] bower. Camps probably Roman have been found at Gedney Hill, near Holbeach, and at Honington, not far from Grantham; a mosaic pavement at Denton, in the same neighbourhood; and Roman coins and pipes of baked earthen-ware are in other places.

Under the Saxons, Lindsey, a name which perhaps extended nearly or quite over the modern county of Lincoln, appears to have been a subordinate state dependent upon the kingdom of Mercia. It was included among the conquests of Edwin of Northumberland, under whose influence Christianity was introduced by the missionary Paulinus. Bede has recorded that Blecca, the governor of Lincoln, was, with his household, among the first converts, A.D. 628.

When the Danes, or Northmen, were carrying on their ravages in England in the time of Ethelred I., Lincolnshire, [illegible] and several monastic establishments, suffered greatly. The narrative of their ravages given in the pages of the [illegible] Ingulphus is interesting; and if its authenticity [illegible] depended on, would afford considerable light amid the [illegible] darkness of the period. Early in the year [illegible] the Northmen landed at Humberstan (Humberstone), near Grimsby, ravaged Lindissy (Lindsey), and marched to Bardeney on the Witham, where was a famous monastery, the monks of which they massacred in the church. About Michaelmas they penetrated into Kesteven, [illegible] and devastation marking their course. Here however they were met by a force thus described by Ingulphus:—"Count Algar (Comes Algarus) and two knights (milites) his seneschals (schenescalli) [illegible] called Wibert and Leofric (from whose names the aged men and rustics thereabout have since given [illegible] to the villages where they lived, calling them Wiberton and Letrinkton [illegible] drew together all the youth of Holland (Hoilandia), with a band (cohors) of two hundred men from the monastery [illegible] Croyland, stout warriors, inasmuch as most of them [illegible] exiles (fugitivi), who were commanded by brother T[illegible]

(Tolius), who had become a monk in that monastery, having been before that the most renowned for military skill in all Mercia, but who had then, from the desire of a heavenly country, given up secular for spiritual warfare at Croyland. They gathered together also about three hundred brave and warlike men from Deping, Langtoft, and Baston (Boston), with whom they joined Morcard (Morcardus), lord of Brunne (Bourne), with his retainers (familia), who were very stout and numerous; they were moreover aided by Osgot, deputy (vicedominus) of Lincoln, a brave veteran, with a band of 500 Lincoln men.' In the first engagement the natives had the advantage; but the reinforcements which joined the invaders in the night struck such terror into the Christians that many fled. The rest having received the sacrament, and 'being fully prepared to die for the faith of Christ and the defence of their country,' marched to the battle. The Northmen, enraged at the loss of three of their kings (who were buried at a place previously called Laundon, but subsequently Trekyngham), fought with the utmost ferocity; but the Christians, though far inferior in number, maintained the combat till nightfall, and were then overcome only by stratagem. Algar and his seneschals and Toly fell; and of the whole body only a few young men of Sutton and Gedeney escaped, who carried the mournful tidings to the monks of Croyland. To that monastery the Northmen soon proceeded, murdered the abbot, and those other inmates who were too old or too young to fly (except one boy of ten years old, whom the compassion of one of the Danish chieftains preserved), and burned the monastery. From Croyland they marched to the monastery of Medeshamsted, now Peterborough, which they also entirely destroyed, having put the inmates, without exception, to the sword.

Lincolnshire passed permanently into Danish hands about A.D. 877; it constituted part of the territory of the Danish burghs of Lincoln and Stamford; and was included within the boundary of the Danelagh, or Danelage (the 'Danish law,' or Danish 'jurisdiction'), as settled by the treaty between Alfred and Guthrun the Dane. The conquest of this part of the island by the Danes appears to have been complete; but the similarity of the laws and institutions of the Anglo-Saxons and the Danes diminished the violence of the changes effected by it. Danish names however supplanted the previous Anglo-Saxon ones; and if we may judge by the prevalence of the Danish termination 'by' (as in Grimsby, Saltfleetby, Normanby, Willoughby, &c.), the change must have been made in a great many cases. The denominations of the popular assemblies and tribunals appear to have been changed; the name 'wapentake' superseded that of 'hundred.' In time however the Danish and Anglo-Saxon population became amalgamated, and the whole district came under the supremacy of the Anglo-Saxon crown.

In the civil war between Stephen and the empress Maud Lincolnshire was the scene of contest. The siege and battle of Lincoln, A.D. 1141, have been already noticed. In the broils in which Henry II. was involved with his children, one of the Mowbrays, who had a castle in the Isle of Axholme, and was an adherent of the insurgent Prince Henry, was compelled to submit by the zeal and loyalty of the Lincolnshire men, who crossed over to the island in boats, obliged the garrison to surrender, and razed the castle to the ground. In the civil war of the barons with John and his son Henry III., Lincoln was signalized by a second battle, which seated Henry III., yet a boy, securely on his throne. At the latter part of his reign, when troubles had again broken out, Axholme became once more the refuge of the disaffected. In the civil war of the Roses Lincolnshire appears not to have suffered much. Sir Robert Wells, out of revenge for his father's death, whom Edward IV. had beheaded, raised a rebellion against that prince, and gathered an army of 30,000 Lincolnshire men. He was defeated with dreadful loss near Stamford, and put to death by the king's command. This battle is sometimes called the battle of 'Lose-coat-field' from the vanquished having cast off their coats in order to run away the faster. At the time of the Reformation the Lincolnshire men broke out into open rebellion upon the suppression of the monasteries, A.D. 1536. The rebellion began at Louth, where the ecclesiastical commissioners were to hold a visitation. It was excited by Dr. Makerel, prior of Barlings, or Oxney, between Lincoln and Wragby, and by one Melton, who assumed the name of 'Captain Cobler.' (*State Papers*, published by the Record Commissioners.) The rebellion spread into Yorkshire, where Robert Aske took the command of the insurgents. The Lincolnshire rebels sent in petitions to the king, specifying what they deemed their grievances; and the king gave an answer (*State Papers*, 'Henry VIII.,' part ii., No. xlviii.), in which he designates the shire 'one of the most brute and beestelie of the whole realm.' The earls of Shrewsbury, Rutland, and Huntingdon, and the duke of Suffolk, were sent into Lincolnshire with all the force that could be collected; and the rebels dispersed without coming to an engagement, delivering up their leaders to the king's officers. Dr. Makerel, with the vicar of Louth and thirteen others, were afterwards executed at Tyburn.

Of the ecclesiastical and baronial edifices which were erected between the Conquest and the Reformation, Lincolnshire contains many admirable specimens, especially churches. The cathedral of Lincoln and the churches of Louth, Sleaford, Spalding, and other places, have been already noticed. On the hill which runs from Lincoln towards Grantham is a line of churches, presenting a number of interesting features. Beckingham, Normanton, and Ancaster have considerable portions of Norman character. Caythorpe church is chiefly of Decorated English character, and presents several singularities in its arrangement. Leadenham has a tower and spire of Early Perpendicular date, and of good design; the rest of the church is an excellent example of Decorated English. The churches on and near the road from London to Lincoln exhibit as much, if not more variety and excellence of composition than is to be met with in any part of the kingdom in the same distance: among them are Sleaford, Folkingham, Bourne, and Market Deeping churches. Kelby, Threckingham, Kirby Laythorpe, Howel, Horbling, Sempringham, and Morton have portions of Norman character. Sempringham church appears to be the remains of a much larger building; it has a tower of plain Perpendicular character. Silk Willoughby church is of fine Decorated English character, with a tower and spire of good composition. Walcot has a tower and fine crocketed spire, which are of Decorated English character, as well as the rest of the church; the east window is very fine. Heckington church is one of the most beautiful models of a church in the kingdom, having almost every feature of a fine church. It is a large cross church, having a nave and aisles, spacious transepts, a large chancel with a vestry attached to the north side, and at the west end a tower crowned with four pentagonal pinnacles and a lofty spire.

The finest churches in the Fens are for the most part of Perpendicular character; they have lofty spires, some of them crocketed. The churches already noticed are chiefly in Kesteven and Holland; those of Lindsey are of inferior architecture, except in the flat marshy tract between the Wolds and the Ocean or the Humber, where there are some fine ones. The churches in this district vary but little in their form and character; they have a nave with north and south aisles, a chancel, south porch, and western tower. They are commonly built with good materials. The churches amid the Wolds have little claim to architectural beauty. In the western parts of Lindsey some of the churches are of great antiquity and of considerable architectural beauty. Stow church, in this part, is of considerable size, and chiefly of Norman character.

Of monastic edifices there are several remains. Of Barling's Abbey part of a wall and some fragments of columns remain. Of Thornton Abbey, not far from Barton-upon-Humber, the remains are more important and interesting. It was founded by William Le Gras, or Le Gros, earl of Albemarle, A.D. 1139, as a priory for Black Canons, and was afterwards made an abbey. Its revenues at the dissolution were 730*l.* 17*s.* 2*d.* gross, or 594*l.* 17*s.* 10*d.* clear; after the suppression, Henry VIII. reserved the revenues for the endowment of a college, consisting of a dean and a considerable number of prebendaries; but this also was suppressed in the reign of Edward VI. The buildings were originally extensive, forming a quadrangle surrounded with a moat, and having lofty ramparts for occasional defence. The gate-house, which formed the western entrance, is yet tolerably entire; four handsome hexagonal towers form the four angles of this gate-house. A spacious room, probably the refectory, and an adjoining room with recesses in both ends, the abbey church, and a portion of the octagonal chapter-house, are also standing. The abbot's lodge, which stood to the south, is occupied as a farm-house.

STATISTICS.

Population.—Lincolnshire is [illegible] agricultural county, ranking [illegible] the list of English counties. Of [illegible] males twenty years of age and upwards, [illegible] are employed in manufactures, or in making manufacturing machinery, while [illegible] are engaged in agricultural pursuits, [illegible] are labourers. Of the few engaged in manufactures [illegible] are employed at Louth in making carpets, blankets, and worsted. At Owston and West [illegible] 45 men are employed in making sacking, tarpaulins, and [illegible]; at Haxey about 20 in similar [illegible]. There is a small manufacture of silk [illegible] at Stamford; of [illegible] at Barton and at Boston [illegible] at [illegible]; and a few weavers are scattered about the county.

The following summary of the population taken at the last census (1831) shows the number of inhabitants and their occupations in each hundred of the county.

The following Table is a Summary of the Population, &c., of every Hundred, &c., as taken in 1831.

HUNDREDS, WAPENTAKE, CITY, or BOROUGH.	HOUSES. Inhabited.	Families.	Building.	Uninhabited.	OCCUPATIONS. Families chiefly employed in Agriculture.	Families chiefly employed in trade, manufactures, and handicraft.	All other Families not comprised in the two preceding classes.	PERSONS. Males.	Females.	Total of Persons.	Males, twenty years of age.

Lincoln, city	2,417	2,492	16	128	470	1,108	914	5,644	6,199	11,843	2,[illegible]
Totals	61,615	65,903	268	1,968	35,749	17,284	12,870	158,858	158,607	317,465	79,5[illegible]

The population of Lincolnshire at each of the four following dates was as under:—

	Males.	Females.	Total.	Increase per cent.
1801	102,445	106,112	208,557	..
1811	117,022	120,869	237,891	14·65
1821	141,570	141,488	283,058	18·98
1831	158,858	158,607	317,465	12·07

showing an increase between the first and last periods of 108,908, or about 52⅓ per cent., which is 4¾ per cent. below the whole rate of increase throughout England.

County Expenses, Crime, &c.—The sums expended for the relief of the poor at the four dates of

		£.		s.	d.	
1801	were	95,575,	being	9	2	for each inhabitant.
1811	..	129,343	„	10	10	„
1821	..	168,786	„	11	11	„
1831	..	174,055	„	10	11	„

The expenditure for the same purpose in the year ending March, 1837, was 111,242*l.* If we assume that the population has increased since 1831 in the same ratio as in the ten preceding years, the above sum gives an average of about 6*s.* 6*d.* for each inhabitant. All these averages are above those for the whole of England and Wales.

The sum raised in Lincolnshire for poor-rate, county-rate, and other local purposes, in the year ending 25th March, 1833, was 225,005*l.*, and was levied upon the various descriptions of property as follows:—

On land	£188,927	8*s.*
Dwelling-houses	30,760	18
Mills, factories, &c.	3,355	9
Manorial profits, navigation, &c.	1,961	16
Total	225,005	11

The amount expended was—

For the relief of the poor	£169,073	10*s*
In suits of law, removal of paupers, &c.	6,750	3
For other purposes	49,073	1
Total	224,896	14

In the returns made up for the subsequent years the descriptions of property assessed are not specified. In the years ending March, 1834, there was raised 228,238*l.*; 1835, 207,367*l.*; 1836, 188,264*l.*; 1837, 133,767*l.*; and the expenditure for each year was as follows:—

	1834.		1835.		1836.		1837.
	£.	s.	£.	s.	£.	s.	£.
For the relief of the poor	161,074	0	146,058	0	131,685	0	111,242
In suits of law, removals, &c.	8,674	0	7,749	0	7,646	0	5,414
Payments towards the county-rate	62,055	0	26,749	0	23 279	0	..
For all other purposes			25,856	0	23,857	0	17,111
Total money expended	£231,803	0	206,412	0	186,467	0	133,767

The saving effected in the expenditure of the poor in 1837, as compared with the sum expended in 1834, was therefore about 31 per cent.; and the saving effected, comparing the same periods of time, in the whole sum expended, was about 42⅓ per cent.

The number of turnpike trusts in Lincolnshire, as ascertained in 1835, is 29; the number of miles of road under their charge is 538. The annual income and expenditure in 1835 were as follows:—

Revenue received from tolls	£28,449	17	0
Parish composition in lieu of statute duty	2,269	11	0
Estimated value of statute duty performed	3,745	3	0
Revenue from fines	12	0	0
Revenue from incidental receipts	1,101	19	0
Amount of money borrowed on the security of the tolls	1	4	0
Total income	35,579	14	0

	£.	s.	d.
Manual labour	8,229	17	0
Team labour and carriage of materials	3,000	12	0
Materials for surface repairs	4,416	12	0
Land purchased	42	4	0
Damage done in obtaining materials	245	17	0
Tradesmen's bills	1,191	9	0
Salary of treasurer	215	13	0
„ of clerk	473	4	0
„ of surveyor	1,673	19	0
Law charges	256	12	0
Interest of debt	5,482	17	0
Improvements	1,580	1	0
Debts paid off	1,669	0	0
Incidental expenses	675	13	0
Estimated value of statute duty performed	3,745	3	0
Total expenditure	32,898	13	0

The county expenditure in 1834, exclusive of that for the relief of the poor, was 25,941*l.*, disbursed as follows:—

	£	s.	d.
Bridges, building and repairs, &c.	703	4	0
Gaols, houses of correction, and maintaining prisoners, &c.	8,594	0	0
Shire-halls and courts of justice, building, repairing, &c.	283	9	0
Lunatic Asylums	36	8	0
Prosecutions	2,980	17	0
Clerk of the peace	1,612	9	0
Conveyance of prisoners before trial	516	5	0
Conveyance of transports	37	19	0
Vagrants, apprehending and conveying	338	3	0
Constables, high and special	401	17	0
Coroner	405	4	0
Debt, payment of, principal and interest	7,941	9	0
Miscellaneous	2,089	16	0

The number of persons charged with criminal offences in the three septennial periods ending with 1820, 1827, and 1834, were 1296, 1563, and 2237 respectively; making an average of annually 185 in the first period, of 223 in the second period, and of 319 in the third period. The number of persons tried at quarter-sessions in each of the years 1831, 1832, and 1833, in respect of whom any costs were paid out of the county-rate, was 197, 210, and 244 respectively.

Among the persons charged with offences there were committed for

	1831.	1832.	1833.
Felonies	161	164	214
Misdemeanors	36	46	30

The total number of committals in each of the same years was 225, 243, and 301 respectively.

	1831.	1832.	1833.
Convicted	157	195	244
Acquitted	31	28	31
Discharged by proclamation	34	20	23

At the assizes and sessions in 1837 there were 412 persons charged with criminal offences in this county. Of these 33 were charged with offences against the person, 13 of which were for common assaults; 29 persons were charged with offences against property committed with violence, 325 with offences against property committed without violence; 1 for destroying trees; 1 for uttering counterfeit coin; 16 for riot; 4 for poaching; 1 for perjury; and 2 for minor misdemeanors. Of the whole number committed, 291 were convicted, 83 were acquitted, and against 38 there were no bills found, or no prosecution. Of the whole number of persons convicted, 12 were sentenced to death, but none were executed; the sentences of 9 of them were commuted into transportation for life; of 2 others for periods of 15 and of 7 years; and of 1 into imprisonment for 1 year, or more than 6 months: 13 criminals were sentenced to transportation for life, and 41 for various periods; 9 were sentenced to imprisonment for 2 years, or more than 1; 35 for 1 year or more than six months; and 169 for 6 months or under; 12 were sentenced to be whipped or fined, or were discharged on sureties. Of the whole number of offenders, 345 were males and 67 were females; 136 could not read nor write; 232 could read and write imperfectly; 37 could read and write well; 2 had received superior instruction, and the degree of instruction of the remaining 5 could not be ascertained.

The number of persons qualified to vote for the county members of Lincolnshire is 18,241, being 1 in 17 of the whole population, and 1 in 4 of the male population twenty years and upwards, as taken in 1831. The expenses of the last election of county members to parliament were, to

[illegible]

The growth of the linen manufacture in Ireland is ascribed to the legislative distinction raised in the reign of William III. to the prejudice of that part of the kingdom of the woollen manufacture, which it was alleged interfered prejudicially with the clothiers of England, the linen [illegible] being at the same time encouraged by premiums [illegible] by [illegible] boards [illegible] by parliament, and by bounties paid on the exportation [illegible] to foreign countries.

We have no certain means for ascertaining the growth of the linen manufacture in Ireland. The only facts by which we can approximate to its amount are afforded by custom-house records, which do not reach back to an early date, and are wanting for the years subsequent to 1825, when the intercourse between Great Britain and Ireland was put upon the footing of a coasting trade; and in order to save the salaries of two or three junior clerks, no further record was attempted to be made of its amount or direction. The average quantity of linen exported annually from Ireland, principally to England, in the three years to March, 1790, was 30,191,754 yards. In the three years ending March, 1800, the yearly average was 36,112,369 yards, and the average annual exports in the last three years of each of the next two decennary periods was 40,721,969 yards and 39,204,711 yards respectively. In the six years from 1820 to 1825 the quantity sent from Ireland to Great Britain was—

1820	42,663,923 yards.
1821	43,418,710 „
1822	43,296,730 „
1823	49,003,591 „
1824	48,450,920 „
1825	55,360,926 „

An attempt was lately made by the commissioners appointed to consider and report concerning railway communications in Ireland to ascertain the extent of these exports, and they have stated, as the result of their inquiries, that in 1835 there were shipped from Ireland 70,209,572 yards of linen, the value of which was 3,736,854*l.*

The linen manufacture was introduced into Scotland early in the last century, and in 1727 a board of trustees was appointed for its superintendence and encouragement. Notwithstanding this and the further stimulus afforded by premiums and bounties, the progress of the manufacture in that part of the kingdom was for a long time comparatively unimportant. At Dundee, the great seat of the Scotch linen trade, it is stated that the whole quantity of flax imported in 1745 was only 74 tons, and the quantity of linen sent away did not exceed 1,000,000 yards. In less than half a century after that time the annual importation of flax was 2500 tons, and there were exported 8,000,000 yards of linen beyond the quantity used at home. At this rate the manufacture continued nearly stationary until after the peace in 1815, when a new impulse was given to it; and in 1837 there were imported into Dundee 30,140 tons of flax, besides 3069 tons of hemp, and there were exported from that place 641,032 pieces of different qualities of linen, sail-cloth, and bagging, besides a quantity, computed to be as great, retained for home use.

The bounties allowed on the shipment of linens were graduated according to their quality and value, and ranged from a halfpenny to a penny halfpenny per yard. In 1825 the rates were diminished one-tenth by an act then passed, and an equal proportion was to have been taken off in each subsequent year; so that the whole would have ceased in 1834: but by the act 9 Geo. IV., c. 76 (July, 1828), when one-half the bounties had been removed, this course was modified by continuing for three years the rates of allowance payable in 1829, and thereafter repealing the bounty altogether; so that the payments ceased on the 5th January, 1832. Judging from the extent of our exports before and since the diminution and repeal of the bounties, it does not appear that the manufacture has thence experienced any disadvantage, while the country has saved from 300,000*l.* to 400,000*l.* per annum, formerly paid to enable foreigners to purchase our linen at prices below the cost of production.

The quality of linen yarn is denoted by numbers describing the number of leas (a measure of 300 yards) contained in each pound weight. Thus a pound of No. 60 yarn measures 60 leas, or 18,000 yards, the present price of which is 2*s.* 9*d.* per lb. The following table exhibits the length and value at present (*December*, 1838) per lb. of yarn of various qualities:—

		Yards.	per lb. *s.*	*d.*			Yards.	per lb. *s.*	*d.*
No.	5	1,500		4	No.	45	13,500	1	11
	10	3,000		5½		50	15,000	2	1
	16	4,800		6¾		60	18,000	2	9
	20	6,000		7½		80	24,000	3	7½
	25	7,500	1	1		100	30,000	5	0
	30	9,000	1	4½		150	45,000	8	9
	35	10,500	1	6¾		200	60,000	12	6
	40	12,000	1	9¾					

Linen yarn is seldom spun of greater fineness than No. 200, which is fitted for making cambric of good quality. The production of mill-spun yarn was for a long time confined to Yorkshire, but is now extended to Devonshire, Lancashire, Somersetshire, and to Scotland; and recently some iron mills for the purpose have been erected in and near to Belfast in Ireland. The improvements realized in this branch of the manufacture will be sufficiently indicated by the fact that the average fineness of mill-spun yarn made in 1814 was 11·1 leas (3330 yards) per lb., and in 1833 had reached 37·1 leas (11,130 yards) per lb., while the cost had diminished in the proportion of 67½ per cent. More recent improvements have carried the average degree of fineness to a much higher point, and have still further economized the cost of manufacture. To show the effect which these improvements in the spinning process have had upon finished cloths, it may be mentioned that the price of No. 47 canvas, the quality and dimensions of which are always the same, which in 1814 was [illegible] per piece, had fallen in 1833 to 18*s.*

The number of flax factories at work in different parts of the kingdom, according to returns made by the inspectors of factories in 1835 was 347, of which 152 were in England, 170 in Scotland, and 25 in Ireland. The number and ages of the persons employed in these mills were—

	Between 8 and 12 Years.		Between 12 and 18 Years.		Above 18 Years.		Total.	
	Males.	Fem.	Males.	Fem.	Males.	Fem.	Males.	Females.
England . .	457	454	2,277	5,336	2,611	4,385	6,345	10,175
Scotland . .	364	175	1,729	3,992	1,650	5,880	3,263	10,047

							33,[illegible]	

The quantity and value of linen and linen-yarn exported from this kingdom in each of the ten years from 1828 to 1837 have been as under:—

	Linen, yards.	Yarn, lbs.	Declared Value. £	Exported to the United States of America. Yards.
1828	70,487,344	..	4,136,978	37,635,554
1829	67,690,372	..	1,052,027	34,307,095
1830	61,310,062	..	3,017,779	20,686,788
1831	69,233,692	..	3,200,519	26,291,580
1832	49,021,027	110,188	1,725,290	8,694,029
1833	63,776,209	855,099	2,167,379	21,237,367
1834	67,834,349	1,328,065	2,984,383	25,110,880
1835	77,977,188	2,611,215	3,182,774	37,929,974
1836	82,169,748	4,574,464	3,620,383	39,307,630
1837	59,455,331	8,373,104	2,833,732	17,493,425

It will be seen from the last column in the foregoing table that the fluctuations experienced in the amount of our exports have been occasioned by interruptions that have arisen in the prosecution of our trade with the United States of America. Next in importance to the quantity taken by those States are the exports made to our own American and West India colonies, the foreign West Indies, and Brazil. Our shipments of linen and linen-yarn to different European countries are still of comparatively little moment, if we except the exports made within the last few years to France, and which are almost wholly the consequence of improvements in our spinning and weaving processes. The total value of these exports in 1828 amounted to no more than 7,235*l.*, the value of 64,912 yards of linen; whereas in 1837 that country took from us 3,269,358 yards of linen, and 7,610,993 lbs. of yarn, valued together at 648,519*l.*

LINES, in Music, are the five parallel lines forming, together with the intermediate spaces, the staff on which the notes and other characters are placed. [STAFF; LEGER.]

LINES OF INTRENCHMENT. In the article ENCAMPMENT it has been stated that armies in the field are not now, as formerly, surrounded by fortifications consisting of a continuous line of works; and that, in general, a few housetworks or redoubts merely are constructed at intervals for the defence of the position. It will be sufficient therefore, leaving out the consideration of those means of defence which are afforded by the natural obstacles of the country, as escarpments, rivers, marshes, &c., to describe briefly the nature of those intrenchments which were once, in all circumstances, considered indispensable, and which are still, to a certain extent, necessary when an army is to remain strictly on the defensive.

[illegible] the low parts [illegible] that a [illegible] [illegible] [illegible] [illegible] [illegible] guns of [illegible] while the enemy [illegible], and form a parapet A B, covered by the redans C, C, from which the defenders might annoy the enemy in flank, as he approaches, would suffer. The distances of the redans from one another may be about 250 yards, or not exceeding the range of musketry; and such was the construction recommended by Vauban, which, [illegible], has been [illegible] the lines [illegible] might be more effective [illegible] the faces of the redans. These faces [illegible], if produced to an extent equal to the range of artillery, the lines of direction might fall on ground where the enemy could not establish batteries for [illegible] [illegible] in the event of such [illegible] would be [illegible] the parapets [illegible] would be [illegible], the parapets in the front would be destroyed; and [illegible] would be made, should the enemy [illegible]. In general the redans may have the form of equilateral triangles, and the lengths of their faces may be about 30 yards. The entrances are [illegible] at the [illegible] of the [illegible].

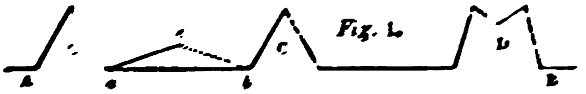

Fig. 1.

Instead of single redans the advanced parts of the line have occasionally been formed of works resembling two [illegible] together, as D; which by the French engineers are called *queues d'[illegible]*.

Again, when the nature of the ground does not permit the intrenchment to be formed with points so far advanced as the vertices of the redans C, C; when, for example, it is required to follow a bank of a river or one side of a road, it is proposed, in preference to a simple straight or curved line, to form the parapet with a series of branches in the positions indicated by *a b*, *c d*, &c., in P. A line of this kind is said to be *à crémaillères*: and in such situations a succession of fires from the branches *a b*, *c d*, &c., may be directed against the enemy during his advance: on a level plain however the longer branches would be subject to the serious defect of being enfiladed. The distances between the salient points *b*, *d*, &c., may be about [illegible] yards, and the lengths of the short branches may be about 15 or 20 yards. The re-entering angles *c*, *e*, &c., should contain about 1[illegible]4 degrees; and the entrances are usually placed at those points.

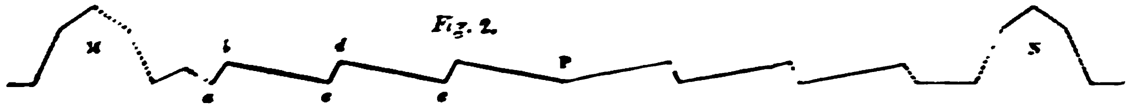

Fig. 2.

A like construction may be adopted when it is required to connect two points, as M and N, by a line along a narrow and elevated ridge of ground; and in this case the directions of the branches *b c*, *d e*, &c., may change in the middle of the line, as shown in the figure, in order that the fire from the short branches may be directed to the front of the nearest works, as M and N, in which it is to be supposed that artillery would be placed for the purpose of defending the ground before the intermediate line.

It may be added also, that the line *à crémaillères* (indented lines) would be convenient when the slope of a hill is in its direction, as from M to P; for then, the enemy being supposed to occupy the ground in front of M, the short branches could be easily raised high enough to defilade those which, as *b c*, *d e*, &c., tend towards the foot of the hill.

The most perfect fortification for defending a line of country presenting few natural obstacles to the advance of an enemy, should the importance of the position render it advisable to incur the labour of the construction, would be a series of bastions connected by curtains, either straight or broken. The principles on which the several *fronts of fortification* should be formed correspond to those adopted for regular fortresses, which are described in the article FORTIFICATION, col. 2; the only difference being in the lengths of the several parts. These depend upon the whole length of the front, which here should not exceed 150 yards, that the faces of the bastions may be well defended by common muskets from the collateral flanks. Neither ravelin nor *covered way* would of course be necessary.

Lines of intrenchment composed of works placed at intervals from one another, provided the distances be not so great as to prevent the troops in them from mutually assisting each other, have great advantages over those formed of continued lines of parapet. In the latter case it is scarcely possible for the army to make a movement for the purpose of attacking the enemy however favourable the opportunity, since much time would be lost in issuing from the line through the narrow passages: and these are the objects against which the fires from the enemy's batteries would then be constantly directed. Detached works, on the other hand, constitute a number of strong points by which the position of the army is secured; while through the spacious intervals an advance or retreat may take place with all necessary facility. Their artillery is conveniently situated for putting the enemy's line in disorder previously to the attack, and for protecting the retiring columns in the event of their quitting the field. It may be added that detached works are capable of being easily adapted to any kind of ground: for it is merely necessary to place them on the more elevated spots in such situations that the enemy may not be able to penetrate between them without being exposed to their fire.

On level ground the intrenchment may consist of a number of redans, as A, B, C, with or without flanks, disposed on a right line or curve, and at distances from one another equal to about 300 yards, that the fire of musketry from them may defend the intervals. In the rear, and opposite the intervals between the works in the first line, a second line of works, as D, E, should be formed; and the faces of these should be disposed so as to flank the approaches to the others. The gorges of the exterior works should be open, as in the figure, or only protected by a line of palisades, which, in the event of the enemy gaining possession of those works, might be destroyed by the artillery in the second line.

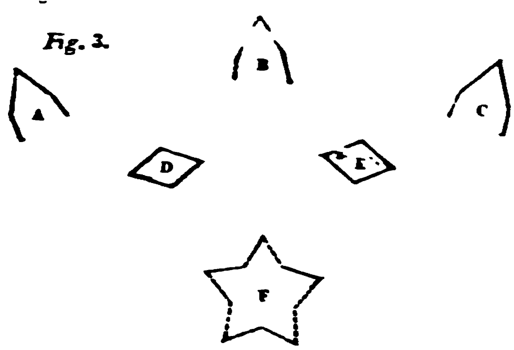

Fig. 3.

Instead of a series of redoubts forming an interior line, it may suffice, should the works A, B, C, &c. be disposed on a convex arc, to have one large central redoubt as F, so situated as by its artillery to defend both the intervals between the redans and the ground within their line.

All the works which have been described consist of parapets formed of earth obtained by cutting a ditch in front; and the profile of any one work with its ditch is shown in the subjoined figure (4).

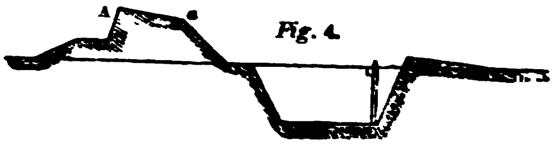

Fig. 4.

The elevation of the crest A above the natural ground about 7¼ feet, unless the vicinity of a commanding height in front should render a greater relief necessary, and the d of the ditch may be the same. The thickness A *a* of upper part of the parapet is variable, and depends upon t importance of the work, or rather, upon the arm wh may be employed in the attack: if it were required only to resist a fire of musketry, 3 feet would suffice; but from 8 feet to 12 feet would be necessary in the event of artillery being brought against it. (Twelve-pounder shot is the heaviest which the French have ever yet employed in the field.) The form of the parapet is the same as in permanent fortification: when time permits, the exterior and interior slopes should be revêted with sods, and a row of palisades should be planted along the foot of the counterscarp.

LINGUELLA. [[illegible], vol. xii.]

LINGULA. [BRACHIOPODA, vol. v., p. 315.] Dr. Fitton, in his Stratigraphical Table of Fossils in the strata below the chalk, records three species (one doubtful) from the lower green-sand; two from Kent, and the remaining one from the Isle of Wight (1836). Mr. Murchison describes and figures several fossil species: one from the old red sandstone, one from the upper Ludlow rock, one from the Aymestry limestone, one from the lower Ludlow rock, one (doubtful) from the same rock, one from the Wenlock shale, and one from the Llandeilo flags. (*Silurian System*, 1838.)

LINGULINA. [FORAMINIFERA, vol. x., p. 347.]

LINKIA. Nardo has proposed this name for a group of Stellerida included in Asterias by Lamarck. (Agassiz, on Echinoderms, 'Ann. of Nat. Hist.,' vol. i.)

LINKOPING. [SWEDEN.]

LINLEY, THOMAS, a composer who ranks high in what the English have a clear right to call their school of music, though slow in defending it, was born at Wells, about the year 1725. He was first the pupil of Chilcot, organist of the abbey, Bath, and finished his studies under Paradies, an eminent Venetian, who had become a resident in this country. Mr. Linley established himself in the latter city, where he was much sought after as a master, and carried on the concerts in that place, then the resort of all the fashionable world during a part of every year. To the attraction of these his two daughters, Eliza and Mary, afterwards Mrs. Sheridan and Mrs. Tickell, by their admirable singing, particularly that of the former, which we are told has never been surpassed, contributed very largely.

On the retirement of Christopher Smith, who had been Handel's amanuensis, and succeeded him in the management of the London oratorios, Mr. Linley, by the advice of his son-in-law Mr. Sheridan, united with Mr. Stanley, the blind composer, in continuing those performances; and on the death of the latter, Dr. Arnold joined Linley in the same, an undertaking by no means unprofitable in its results. In 1775 he set the music to Sheridan's opera *The Duenna*, which had a run unparalleled in dramatic annals; it was performed seventy-five times during that season. This led to his entering into a treaty to purchase Mr. Garrick's moiety of Drury-lane theatre; and in 1776 he, conjointly with Mr. Sheridan, bought two-sevenths of it, for which they paid 20,000*l*., Dr. Ford taking the other three-fourteenths, and the chief management was entrusted to Sheridan, while to Linley was assigned the direction of the musical department. He now devoted his time to the theatre, and, among other pieces, produced his *Carnival of Venice*; *Selima and Azor*, from the French; and *The Camp*, Sheridan's second production. He also added those charming accompaniments to the airs in *The Beggars' Opera*, which are still in use, and it is to be hoped will long remain unaltered. His Six Elegies, written in the early part of his life, contributed in no small degree to his immediate fame and future fortune; they were sung by all who could sing, and will never cease to be admired by those who, uninfluenced by fashion, have taste enough to appreciate what is at once original, simple, and beautiful. His Twelve Ballads are lovely melodies, but being in the style of 'the days that are gone,' have fallen into the neglected state of many other excellent English compositions; to be however as surely revived as were the works of Purcell, after they had slumbered long years in damp closets or on dusty shelves. His madrigal 'Let me careless and unthoughtful lying' (one of Cowley's Fragments), a work which certainly has no superior, if a single equal, of the sort, is still heard at the Ancient Concerts, the Catch and Glee Clubs, and wherever really fine vocal harmony—music of the enduring kind—is cultivated or promoted.

Mr. Sheridan's political and social engagements having occupied a large portion of the time which, in prudence, ought to have been devoted to the theatre, the management of its concerns fell much on Mr. Linley; and herein he received great assistance from his wife, a lady of strong mind and active habits, by whose care the pecuniary affairs of that vast concern were well regulated, so long as she had any control over them.

Mr. Linley survived his two accomplished daughters and several of his other children. But some years previous to their decease he suffered a shock by the loss of his eldest son Thomas, who was drowned by the upsetting of a boat while on a visit to the duke of Ancaster, in Lincolnshire, from which and his subsequent bereavements his mind never entirely recovered. This young man, who had just reached his twenty-second year, possessed genius of a superior order. His musical education was as perfect as his father's and Dr. Boyce's instructions and those of the best masters of Italy and Germany could render it, and he had given decided proofs of its efficiency when the fatal accident occurred. None out of his own family more lamented the event than his friend the celebrated Mozart, with whom he had lived on the Continent in the closest intimacy, and who always continued to mention him in terms of affection and admiration. Mr. Linley died in 1795, leaving a widow, a daughter, and two sons, of whom

LINLEY, WILLIAM, born about the year 1767, and educated at Harrow and St. Paul's schools, was the younger. Mr. Fox appointed him to a writership at Madras, and he soon rose to the responsible situations of paymaster at Vellore and sub-treasurer at Fort St. George. He returned from India early, with an easy independence, and devoted the remainder of his life partly to literary pursuits, but chiefly to music, of which he was passionately fond, a talent for the art coming to him as it were by inheritance. He produced a considerable number of glees, all of them evincing great originality of thought and refined taste, some of which will make him known to posterity, along with others who have most distinguished themselves in this charming and truly national kind of music. Mr. W. Linley also published, at various periods, a set of Songs, two sets of Canzonets, together with many detached pieces. He was likewise the compiler of the 'Dramatic Songs of Shakspeare,' in two folio volumes, a work of much research and great judgment, in which are several of his own elegant and sensible compositions. Early in life he wrote two comic operas, which were performed at Drury-lane theatre; also two novels, and several short pieces of poetry. He likewise produced an elegy on the death of his sister Mrs. Sheridan, part of which is printed in Moore's 'Life of Richard Brinsley Sheridan.' This last survivor of the Linley family died in 1835.

LINLITHGOW, or WEST LOTHIAN, is a small county of Scotland, bounded on the north by the Frith of Forth, on the west, south-west, and north-west by the shires of Stirling and Lanark, and on the south and south-east by Edinburghshire, from which it is separated by the rivers Breich and Almond. Its greatest length, from the mouth of the Almond to the borders of Stirling and Lanarkshire, is nearly 21 miles; and its greatest breadth, from the north-west extremity of the county to the village of Livingston, on the south-east, somewhat exceeds 10 miles: it is comprised between 55° 51′ and 56° 1′ N. lat., and 3° 17′ and 3° 40′ W. long.

In 1794 Mr. Trotter estimated the area of the county and the distribution of the soil as under:—

	Scotch Acres.
Good clay lands	14,000
Loam	7,000
Light gravel and sand	7,000
Clay, cold, wet and hard bottom	18,000
High rocky land	10,000
Moss	1,000
	57,000

or about 71,296 English statute acres, which is probably rather less than the true area. Mr. M'Culloch estimates it at 76,800 statute acres, or 120 square miles.

The surface is pleasantly diversified by hills and valleys, and intersected by numerous rivulets or burns, but there are no streams which merit the appellation of rivers, excepting the Avon and Almond, and even these are small, and belong as much to the shires of Stirling and Edinburgh as to that of Linlithgow. No fish, beyond a few fresh-water trout, are found in them; but the two lochs in the vicinity of the town of Linlithgow are well stored with pike. The Union

[illegible]

[illegible] worked [illegible] most [illegible] There is also [illegible] great advantage [illegible]

[illegible] is the same as that of [illegible] with the exception that [illegible] The [illegible] adopted upon clay soils is [illegible] wheat [illegible] beans and [illegible] grass for hay [illegible] The [illegible] of the farm [illegible] a very [illegible] The [illegible] from the [illegible] The hay [illegible] in July [illegible] of October [illegible] leases are [illegible] years, though in some [illegible] 17 years. [illegible] which [illegible] to take every advantage [illegible] and we are [illegible] to the [illegible] been altogether discontinued. The average rent of land in [illegible] was [illegible] the [illegible] acre, and in [illegible] the annual value of the real property of the county [illegible] than in other parts of Scotland, was 17,[illegible] The cotton manufactures [illegible] from 7[illegible] to 8[illegible]

The county is divided into fourteen parishes, the united population of which in [illegible] was 23,[illegible], namely, 10,[illegible] males and [illegible] females, who were distributed among [illegible] families, of whom [illegible] were engaged in agriculture, and [illegible] in trade, manufactures, and handicraft. The county returns one member to parliament.

The following table exhibiting the state of the several parochial schools in the year [illegible], is compiled from parliamentary papers relating to the parochial education of Scotland. It does not include the private schools, which are [illegible] supported:—

Parish.	Salary and [illegible] of [illegible] Year 1825	[illegible] Fees per Quarter in the Year 1825 [illegible] Branches of Education then taught.	Average Number of Scholars.

The [illegible] are Linlithgow, Bathgate, and [illegible]

[illegible] The revenue, derived principally from landed property and town-dues, amounted in the [illegible] year to [illegible], which was exceeded by the expenditure.

The town is [illegible] It is [illegible] supplied with water, but not protected by an efficient police. The population in 1831 was [illegible]

The burgh school is said to be [illegible] The [illegible] teachers are appointed by the town-council after undergoing an examination by the professors of Latin or the rector of the high school of Edinburgh. Linlithgow unites with Lanark, Peebles, and Selkirk in returning one member to parliament. The chief object of interest in this place is the palace of Linlithgow, which, after being a royal residence for several centuries, was accidentally set on fire in the year [illegible], and is now a magnificent ruin. In the palace chapel is still shown the place where an apparition is said to have warned James IV. of the impending issue of the battle of Flodden.

Borrowstounness is an incorporated seaport-town, 17 miles west by north from Edinburgh. Here are extensive salt-works, the produce of which is supposed to exceed 3[illegible] bushels annually. There is also a little ship-building carried on, and some trade with the Baltic in tallow, hemp, &c.; but during the season a considerable portion of the inhabitants are engaged in the herring-fishery. The harbour is considered safe and commodious, and, with a view to effect its improvement, an act was passed in 1744 (17 Geo. II.), whereby an impost of 2d. Scots is levied on every Scotch pint of ale or beer brought into the town. The depth of water in spring-tides is about 16 feet. The revenue, consisting principally of harbour-dues, amounted in 1835 to 216l., which was insufficient to defray the ordinary disbursements for keeping the harbour and town in repair, and paying the interest of a debt which had then accumulated to 203[illegible]l. The population in 1831 was [illegible]

(Trotter's *General View of the Agriculture of West Lothian*, 4to., 1794; M'Culloch's *Statistical Account of the British Empire*; *Local Reports from Commissioners on Scotch Corporations*, 1835-36; *Beauties of Scotland*; Sinclair's *Statistical Account of Scotland*.)

LINNÆUS, or VON LINNE', CARL, was born at Râshult, in the province of Smaland, in Sweden, May 1[illegible], 1707 (O.S.). His father, Nicholas Linnæus, was the assistant clergyman of a small village called Stendrohult, of which Râshult was a hamlet, and is related to have resided in a 'delightful spot, on the banks of a fine lake, surrounded by hills and valleys, woods and cultivated ground,' where it is believed that the son imbibed in his earliest youth a fondness for the objects of animated nature. His maternal uncle too, who educated him, is said to have been conversant in plants and horticulture; and thus, according to the declaration of Linnæus himself, he was at once transferred from his cradle to a garden. The father seems to have himself had some acquaintance with botany, and to have instructed his boy at a very early age in the names of the natural objects which surrounded them. Linnæus however is said to have had little taste for remembering names, and his father found it no easy matter to overcome this inaptitude; he however at last succeeded, and the consequence was sufficiently conspicuous in the decided turn for nomenclature which the mind of the pupil eventually took. Whether in the next stages of learning Linnæus was ill-managed, as he himself thought, or whether the nature of his education at home had rendered him indisposed for drier and severer studies, it is certain that his preceptors found great cause to complain of him, and pronounced him, at the age of nineteen, if not a positive blockhead, at all events unfit for the church, for which he was intended) they in fact recommended him to be apprenticed to some handicraft trade. The schoolmaster at Wexiö, who pronounced this unfortunate judgment, although designated by one of Linnæus's biographers as an 'ungenial doctor,' does not appear to have been so blameable for his opinion, however erroneous it afterwards proved; for Bishop Agardh admits that when, at the age of twenty, Linnæus arrived at the university of Lund, for the purpose of studying medicine, the profession finally determined upon for him, he was less known for his acquaintance with natural history than for his ignorance of everything else.

Matriculated at Lund, Linnæus was so fortunate as to be received into the house of Dr. Stobæus, a physician possessing a fine library and a considerable knowledge of natural history. This amiable man was not slow to discover the signs of future greatness in his lodger; he gave him unrestrained access to his books, his collections, his table, and above all to his society, and would at last have adopted him for his son and heir. It was at this time that Linnæus first began to acquire a knowledge of what had been already written upon natural history; to gain an insight into the value of collections, to extend his ideas by the study of the comparatively rich Flora of his alma mater, and above all things to enjoy the inestimable advantage of having an experienced friend upon whose judgment he could rely. The year 1727-8, and the house of Stobæus, were beyond all doubt the time and place when Linnæus first formed that fixed determination of devoting himself to the study of natural history, which neither poverty nor misery was afterwards able to shake. In the year 1728 he passed the vacation at home, and there formed the resolution of prosecuting his future studies at Upsal—a measure which for the time lost him the good-will of his patron Stobæus. For the purpose of meeting the expenses of his academical education, his father was unable to allow him a larger annual sum than 8l. sterling; and with this miserable stipend he had the courage to plunge into the world. Nothing less than the most biting poverty could be the immediate result of such a measure; and we accordingly find Linnæus, for some time after this, in a state of miserable destitution, mending his shoes with folds of paper, trusting to chance for a meal, and in vain endeavouring to increase his income by procuring private pupils. No succour could be obtained from home, and it is difficult to conceive how he should have struggled with his penury without the slender aid afforded by a royal scholarship, awarded him on the 15th of Dec. 1728. Nevertheless he diligently persevered in attendance upon the courses of lectures connected with his future profession—the more diligently perhaps because of his poverty; and by the end of 1729 the clouds of adversity began to disperse. By this time he had become known to Dr. Olaus Celsius, the professor of divinity at Upsal, who was glad to avail himself of the assistance of Linnæus in preparing a work illustrating the plants mentioned in the Holy Scriptures. His new friend procured him private pupils and introduced him to the acquaintance of Rudbeck, the professor of botany, then growing old, who appointed him his deputy lecturer, took him into his house as tutor to his younger children, and gave him free access to a very fine library and collection of drawings.

Here the published writings of Linnæus were commenced; it was in the midst of the library of Rudbeck that he began to sketch those works which were afterwards published under the titles of 'Bibliotheca Botanica,' 'Classes Plantarum,' 'Critica Botanica,' and 'Genera Plantarum;' and to perceive the importance of reducing into brevity and order the unmethodical, barbarous, confused, and prolix writings with which he was surrounded. In the prosecution of a task of such imminent necessity, he fell into the opposite errors of attempting to make the language of natural history more precise than is possible from the nature of things, of reducing the technical characters of species and genera to a brevity which often proved a nullity, and of reforming the terminology till it became pedantic: there is no candid person who will not be ready to acknowledge that such errors were of no importance whatever when compared with the great good which the writings of Linnæus upon the whole effected. In the year 1731 Linnæus quitted the house of Rudbeck, and on the 12th of May, 1732, proceeded under royal authority and at the expense of the university of Upsal upon his celebrated journey into Lapland. On horseback and on foot he accomplished his object by the 10th of October following, when he returned to Upsal, after travelling alone and slenderly provided, over nearly 4000 miles. The result of this expedition has been given in his excellent 'Flora Lapponica,' and in the Swedish account of his tour, of which an English translation was published some years since. For some time after his return we find him occupied in teaching mineralogy, particularly the art of assaying; persecuted by the miserable jealousy of a certain Dr. Rosen, on whom he is said to have drawn his sword, and travelling in Dalecarlia at the expense of the governor. In the beginning of 1735 he had scraped together 15l., with which he set out upon his travels in search of some university where he could obtain the degree of doctor in medicine the cheapest, in order that he might be able to practise physic for a livelihood. At Harderwijk, in Holland, he accomplished his purpose, June 23, 1735, on which occasion he defended the hypothesis that 'intermittent fevers are owing to fine particles of clay taken in with the food, and lodged in the terminations of the arterial system.'

In Holland Linnæus formed a friendship with Dr. John Burmann, professor of botany at Amsterdam, and it was during his stay of some months with that botanist that he printed his 'Fundamenta Botanica,' a small octavo of thirty-six pages, which is one of the most philosophical of his writings. At that time he was introduced to Mr. George Clifford, a wealthy Dutch banker, possessing a fine garden and library at a place called Hartecamp. This gentleman embraced the opportunity of putting it under the charge of Linnæus, who continued to hold the appointment till the end of 1737, during which time he is said to have been treated with princely munificence by his new patron. His scientific occupations consisted in putting in order the objects of natural history contained in Mr. Clifford's museum, in examining and arranging the plants in his garden and herbarium, in passing through the press the 'Flora Lapponica,' 'Genera Plantarum,' 'Critica Botanica,' and some other works, and in the publication of the 'Hortus Cliffortianus,' a fine book in folio, full of the learning of the day, ornamented with plates, and executed at the cost of Mr. Clifford, who gave it away to his friends. Some idea may be formed of the energy and industry of Linnæus, and of his very intimate acquaintance with botany at this period of his life, by the fact that the book just mentioned, consisting in a great extent of synonyms, all the references to which had to be verified, was prepared at the rate of four sheets a week, a prodigious effort considering the nature of the work, which Linnæus might well call 'res ponderosa.' He however seems to have possessed powers of application quite beyond those of ordinary men; and to have worked day and night at his favourite pursuits. In May, 1737, he speaks of his occupations as consisting of keeping two works going at Amsterdam, one of which was the 'Hortus Cliffortianus,' already mentioned; another at Leyden, a fourth in preparation; the daily engagement of arranging the garden, describing plants, and superintending the artists employed in making drawings, which alone he calls 'labor immensus et inexhaustus.' (Van Hall, p. 19.) Linnæus however seems to have been weary of the life he led at Hartecamp, and towards the end of 1737 he quitted Mr. Clifford under the plea of ill health and an unwillingness to expose himself again to the autumnal air of Holland. These however seem to have been only excuses, for he did not really quit the country before the spring of 1738, and in fact he was evidently tired of his drudgery; good Mr. Clifford would scarcely allow him to leave the house, where Linnæus complains of being 'incarceratus monachi instar [illegible].' It was during his engagement at Hartecamp that he visited England, where he seems to have been disappointed both at his reception and the collections of natural history which he found here. He was ill received by Dillenius, at that time professor of botany at Oxford, who was offended at the liberties Linnæus had taken with some of his genera; and although the quarrel was made up before his return to Holland, it seems to have discomposed the Swedish naturalist not a little. He describes the celebrated collection of plants formed by Sherard at Eltham as being unrivalled in European species, but of little moment in exotics; he found the Oxford garden in a like condition, but with the greenhouses and stoves empty; and the great collection of Sir Hans Sloane in a state of deplorable confusion and neglect. Dr. Shaw, the traveller in the Levant, seems to have pleased him most, and he, together with Philip Miller, the celebrated gardener to the Society of Apothecaries, Mr. Peter Collinson, and Professor Martyn the elder, were apparently the only acquaintances Linnæus succeeded in forming. By this means he acquired a considerable addition to his collections of plants and books. While in Holland he also induced Professor Burmann, in conjunction with five printers, to undertake the publication of Rumphius's important 'Herbarium Amboinense,' at an estimated cost of 30,000 florins.

Upon his return to Sweden he commenced practice in Stockholm as a physician, and with the aid of a pension of 200 ducats from the government, on condition of lecturing publicly in botany and mineralogy, his prospects for the future became so satisfactory as to enable him to marry at Midsummer, 1739. By this time his botanical fame had spread over all Europe; the importance of the critical improvements he had introduced into this and other departments of natural history had become generally acknowledged, and his new method of arranging plants by the differences in their stamens and pistils had been adopted in many countries, but not in Sweden. Impatient at receiving less honour in his own country than elsewhere, he wrote a book called 'Hortus Agerumensis,' arranged according to his system, which hepassed off upon Rudbeck, at that time professor of botany at Upsal, as the production of his friend Rothmann, who however had no further hand in it than that of writing the preface, which was an eulogium of Linnæus and his new system of botany. The book was eventually published under the name of Ferber, and accomplished the object of the contrivers, for afterwards no other botanical arrangement was received in Sweden.

From this time forwards the life of Linnæus was one of increasing fame and prosperity. Every branch of natural history was revised or remodelled by him; books and collections were sent to him from all parts of the world; his pupils Hasselquist, Osbeck, Sparmann, Thunberg, Kalm, Lofling, and others, communicated to him the result of their travels in Europe, Asia, Africa, and America. He was named professor of medicine at Upsal in 1740, and afterwards of botany; in 1746 he received the rank and title of archiater; in 1757 he was raised to the nobility, and took the title of Von Linné, and by the year 1758 he was able to purchase the estates of Hammarley and Söfja for 80,000 Swedish dollars, above 2330*l.* sterling.

During these eighteen years his life was one of incessant labour; besides his practice as a physician, which was extensive and lucrative, and his duties as professor, he published a most extraordinary number of works on various branches of natural history. His works upon other branches of natural history were less important than those on botany, but they all evinced the same ingenuity in classification, and that logical precision which has rendered the writings of Linnæus so generally admired. In addition to a large number of dissertations, bearing the names of his pupils, and now collected under the title of 'Amœnitates Academicæ,' the 'Flora,' and 'Fauna Suecica,' 'Materia Medica,' edition after edition of the 'Systema Naturæ,' and numerous miscellaneous works, some of great importance, he produced his 'Philosophia Botanica,' and 'Species Plantarum.' The former, dictated from a sick bed, was the best introduction to botany that had been written, and is far superior to the numerous dilutions of it which subsequently appeared from the pens of his followers. The latter contributed more than any work which had before been seen to place the existing knowledge of plants in a clear and intelligible form; the invention of generic and specific names, by which every known plant could be spoken of in two words, was in itself a great step towards securing order and perspicuity in future botanical writings, and the methodical and concise arrangement of references rendered it invaluable, notwithstanding its omissions, as a catalogue of the plants at that time known. Viewed with reference to the existing state of knowledge, this book deserves all the praise which has been given it; and botanists have, as if by common consent, taken the second edition, which appeared in 1762, as the point of departure for systematic nomenclature. So great is the importance still attached to it, that an edition, chiefly consisting of it and the 'Genera Plantarum,' incorporated in the state in which they were left by Linnæus, has nearly passed through the press under the name of 'Codex Botanicus Linnæanus,' collated by Dr. Hermann Eberhard Richter.

Towards the latter part of his life Linnæus suffered severely in health. Apoplexy succeeded repeated attacks of gout and gravel, and was followed in its turn by paralysis, which impaired his faculties, and at last he was carried off by an ulceration of the bladder, on the 10th of January, 1778, in the 71st year of his age. 'His remains were deposited in a vault near the west end of the cathedral at Upsal, where a monument of Swedish porphyry was erected by his pupils. His obsequies were performed in the most respectful manner by the whole university, the pall being supported by sixteen doctors of physic, all of whom had been his pupils.' A general mourning took place on the occasion at Upsal, and king Gustavus III. not only caused a medal to be struck expressive of the public loss, but introduced the subject into a speech from the throne, regarding the death of Linnæus as a national calamity.

In the article Botany we have already adverted to the effect produced by Linnæus upon that branch of science. His merit as a systematist is unquestionable; the clearness of his ideas, his love of science, his skill in abridging, abstracting, and recombining the undigested matter contained in the bulky tomes of his predecessors, and the tact with which he seized the prominent facts relating to all the subjects he investigated, enabled him to produce a complete revolution in botany, and to place it at a height from which it would never have descended had he been able to leave his genius and his knowledge to his followers. We by no means agree with those who look upon Linnæus as a mere namer of plants, for there is ample evidence in his writings that his mind soared far above the anility of verbal triflers; but he regarded exactness in language as a most important means to an end, especially in sciences of observation; and who is there to say that he was wrong? His systems of classification were excellent for the time when they were invented, although now worthless; and it is never to be forgotten that Linnæus regarded them merely as temporary contrivances for reducing into order the confusion he found in all branches of natural history. Perhaps he believed his sexual system of botany a near approach to perfection, and so it was as an artificial mode (and its great author regarded it as nothing more) of arranging the 6000 or 7000 species he was acquainted with; although it cannot be usefully applied to the vast multitudes of plants with which botanists are overwhelmed by the discoveries of modern travellers. He never attached the importance to it which has been insisted upon by his followers, who, unable to distinguish between the good and the evil of his works, have claimed unbounded respect for everything that bears the stamp of Linnæus. Neither are we disposed to admit the fairness of those critics who complain of the absence of physiological knowledge from the writings of Linnæus; it should be remembered that in his time very little was known upon the subject, and that of what did appear in the books of the day a great deal was not likely to attract the attention of a mind which valued exactness and precision above all other things. The most serious charge that Linnæus is open to is that of indecency in his language; some of his descriptions, it is asserted, 'would make the most abandoned person blush.' One of his greatest admires and panegyrists has added, 'None but the most abandoned.' We have no disposition to open up such a question as this, which is certainly not very fit for public discussion: but we are bound to say that there is truth in the allegation, and that the language of Linnæus is sometimes disgusting for its pruriency and coarseness.

The domestic life of Linnæus does not bear examination, for it is well known that he joined his wife, a profligate woman, in a cruel persecution of his eldest son, an amiable young man, who afterwards succeeded to his botanical chair. We may smile at the vanity which so often breaks out in the writings of Linnæus, and at the fidgetty anxiety for fame which induced him to make use of Rothmann as his trumpeter in the trick of the 'Hortus Agerumensis,' but such an act as that we have mentioned forms a stain upon his escutcheon which no talent, however exalted, can wipe out.

After the death of the younger Linnæus his library and herbarium were purchased for the sum of 1000*l.* by the late Sir James Edward (then Dr.) Smith, and are now in the possession of the Linnæan Society of London. The herbarium, contained in three small cases, is in good condition, and forms a most curious botanical antiquity, of great value as the means of ascertaining with certainty the synonyms of the writings of Linnæus. It has been very much used for this purpose by its late possessor, but we warn botanists against supposing that the identifications which have been published are to be depended upon.

(Pulteney's *Life of Linnæus*; Smith, in Rees's *Cyclopædia*; Von Hall's *Epistolæ Linnæi*; Agardh, *Antiquitates Linnæanæ*.)

LINNET, the name of a hard-billed singing bird, which though well known under one or the other of its various appellations to every English bird-catcher, has in consequence of the changes of its plumage and the names applied to it when it appears under those changes, given rise to much confusion in our systems and catalogues, and considerable error among the learned as well as the unlearned. In endeavouring to place before the reader the state of the question, we shall, we fear, occupy more space than the title would, at first view, seem to warrant.

Mr. Selby, in his 'British Ornithology,' says of the "common or brown linnet—*Fringilla cannabina*, Linn.": 'This bird has been considered by most of our authors as two distinct species, under the titles of the common or brown Linnet and the greater Redpole. This error has evidently arisen from the altered appearance it bears at particular ages, and during the different seasons of the year.* These changes in all probability had not been suspected, as they certainly had not been traced by the earlier naturalists; and, on the authority of their reputation, succeeding writers sanctioned such mistakes, without giving themselves the trouble of further investigation, till Montagu, who united practical research with scientific knowledge, professed (in the 'Ornithological Dictionary') his conviction of their forming one species; and my own observation and experiments tend to confirm his opinion.' Giving all due praise to Montagu and Mr. Selby for their diligence and acuteness in rectifying an error which seems to have been going on from the time of Willughby to the time of the publication of Bewick's 'Supplement,' we must say a word in favour of one of the fathers of Natural History at the revival of letters. A little investigation would have proved that of Bélon, at least, it cannot be said that the changes of plumage had not been suspected nor traced by him. That acute observer, in his *Histoire de la Nature des Oyseaux* (Paris, 1555), says, in his description of *La Linote*, or *Linotte*, 'Les Linottes ont la poictrine, et le dessus de la teste, grande partie de l'année, de couleur entre rouge et orengée: car elles ont lors la couleur si vive, qu'elle resemble à du sang: mais cela est seulement sur la fin du printemps;'—having previously described the more sombre state of plumage.

Willughby, whose 'Ornithology' was edited by Ray, and contains many observations by the latter, devotes a chapter (ii.) to the subject 'Of the Linnet.' The first section of the chapter is headed 'Of the Linnet in general,' and is as follows: "The characteristic notes of this kind are, 1, a size of body something less than a chaffinch; 2, a testaceous or earthy colour, mixt of cinereous and dusky or brown; 3, a tail a little forked; 4, a peculiar colour of the outmost feathers of the tail, viz. brown, with white borders or edges; 5, a sweet note. Of linnets we have observed four sorts in England: 1. The common; 2. The greater red; 3. The lesser red; 4. The mountain linnet.' Here is probably the principal origin of the subsequent confusion. These four linnets are afterwards described and distinguished at length in the same chapter under the names of '*The common Linnet*; Linaria vulgaris.' '*The greater red-headed Linnet*; Linaria rubra major.' '*The lesser red-headed Linnet*; Linaria rubra minor.' '*The mountain Linnet*; Linaria montana.'

Bechstein, under his description of the common Linnet (*Fringilla cannabina*, Linn, *La Linotte*, Buff., *Der Hänfling*, Bechst.), states that, instructed by long experience and the observations of many years, he hopes to show in his description that the common Linnet (*Fringilla Linota*, Linn.†), the greater Redpole (*Fringilla cannabina*, Linn.), and, according to all appearance, the mountain Linnet (*Fringilla montium*, Linn.), are one and the same species. With regard to the identity of the two first-named species, ornithologists are now generally agreed; with regard to the last, the latter opinion is against Bechstein, and in favour of the mountain Linnet being a distinct species.

M. Temminck, who observes (*Manuel d'Ornithologie*) that *Fringilla cannabina* and *Fringilla montium* have been often confounded, and that he has endeavoured to distinguish them by a small number of characters placed at the head of the short descriptions and of the synonyms, applies the same mode of distinction to *Fringillæ linaria* and *montium*, which he remarks have also been confounded. The short character given by him to his *Gros-bec Linotte* (*Fringilla cannabina*, Linn.), is, 'Bill short, of the width of the front, blackish; throat whitish, marked in the middle by some brown spots;' and he thus describes the various states of plumage, and the synonyms of the bird under each.

Old Male in the Spring.—Feathers of the front, of the breast, and of the lateral parts of the latter, of a crimson-red, terminated by a narrow border of rosy-red; throat and front of the neck whitish, with longitudinal brown markings; top of the head, nape, and sides of the neck, of a pure ash; back, scapulars, and wing-coverts, chestnut-brown; flanks, reddish-brown; middle of the belly and abdomen, white; some of the quills black, bordered externally with white; tail forked, black; the feathers edged externally with white and bordered internally by a large white space; iris, brown; bill, deep bluish; feet, ruddy-brown, more or less pale. Length, 5 inches.

Male, after the autumnal moult at the age of a full year.—On the top of the head large black spots; the back reddish, with spots of chestnut-brown, bordered with whitish-brown; breast, red ash-brown, or red-brown, with borders of whitish-red; brown spots well marked on the flanks, upper tail-coverts black, bordered internally with white and externally with greyish-red. (On raising the feathers of the front and those of the breast, the traces of the red colours which ornament the bird in the spring may be seen.)

In this state M. Temminck considers it to be *Fringilla Linota*, Gmelin; Latham, *Ind.*, v. 1, p. 457, sp. 91; *La Linotte ordinaire*, Buffon, *Ois.*, v. 4, p. 58, t. 1; Id., *Pl. Enl.* 151, f. 1; Gérard, *Tab. Elém.*, v. 1, p. 188; *Common Linnet*, Lath., *Syn.*, v. 3, p. 302.

The Female, which does not change colour after arriving at the adult state, is smaller than the male; all the upper parts are of an ashy-yellowish, sprinkled with blackish-brown spots; wing-coverts of a tarnished red-brown; lower parts bright reddish, but whitish on the middle of the belly, and sprinkled on the flanks with numerous blackish-brown spots.

Young males till the spring have the top of the head and the back reddish-brown, marked with deep brown lanceolate spots; cheeks and nape ashy; all the lower parts of a slightly reddish-white, marked on the middle of the throat and on the breast with longitudinal spots of a deep brown; large reddish-brown spots on the sides; and large lanceolate blackish spots on the coverts of the tail; feet flesh-colour; base of the bill livid blue: it is then the bird given by Meyer, *Vög. Deutschl*, and by Frisch., *Vög.*, t. 9, f. A and B.

For the Old Birds, Male and Female, M. Temminck brings together the following synonyms and references:—*Fringilla cannabina*, Gmel., *Syst.* 1, p. 916, sp. 28; Lath., *Ind.*, v. 1, p. 458, sp. 92; Retz., *Faun. Suec.*, p. 247, No. 226; *La Grande Linotte de Vignes*, Buff., *Ois.*, v. 4, p. 58; Id., *Pl. Enl.* 485, f. 1 (the male putting on its plumage) and *Pl. Enl.* 151, f. 2 (the very old male, under the false name of *Petite Linotte de Vignes*); Id., *Pl. Enl.* 151, f. 1 (either a female, or, perhaps, a male in autumn); Gérard, *Tab. Elém.*, v. 1, p. 190; *Greater Red-headed Linnet or Redpole*, Lath., *Syn.*, v. 3, p. 304; Id., *Supp.*, p. 176; *Bluthänfling*, Bechst., *Naturg. Deut.*, v. 3, p. 141; Id., *Taschenb.*, p. 121; Meyer, *Taschenb.*, v. 1, p. 165; Id., *Vög. Deut.*, v. 1, t., f. 1 and 2; Frisch., *Vög.*, t. 9, f. 1 and 2; Naum., *Vög.*, t. 5, f. 10 (old male), and f. 11 (female); Vlasvink, *Sepp. Nederl. Vög.*, v. 2, t., p. 157; *Montanello Maggiore*, *Stor. degl. Ucc.*, v. 3, pl. 357, f. 1.

In the third part of his 'Manuel' (1835) M. Temminck adds the following references and synonyms:—*Atlas du Manuel*, pl. lithog. (male); Vieill., *Faun. Franç.*, p. 77, pl. 35, *figs.* 2 and 3; Roux, *Ornit. Provenç.*, v. 1, p. 148, tab. 91 (old male in the spring), and 92 (male in autumn); *Fichten und Busch Bluthänfling*, Brehm., *Vög. Deut.* p. 276; *La petite Linotte de Vignes*, Buff., *Pl. Enl.* 151, *fig.* 2 (male in moult); Naum., *Neue Ausg.*, tab. 121.

---

* In the work itself the passage stands as follows; but, as there is an evident transposition of a line, we have given it as above. Original passage: 'This bird has been considered by most of our authors as Linnet and the Greater Redpole. This error has evidently two distinct species, under the titles of the Common or Brown, arisen from the altered appearance it bears at particular ages,' &c.

† It should be 'Linota.'

Returning to the two first parts of M. Temminck's 'Manuel' (2nd edit., 1820), we find him observing that the varieties of the young described by Meyer under the letter *c* and that under the letter *e* ought to be arranged under *Fringilla* [illegible].

M. Temminck remarks that this bird moults but once a year—in the autumn; but nevertheless the spring or nuptial plumage is of a beautiful red tint on the head and breast. He ascribes this to friction and the action of the air, which wear away the sombre and ashy borders of the feathers, and cause the red colour, partially hidden in winter under the ashy edges with which these feathers are terminated, to appear in the spring. He adds that one may conceive that age and the more or less distant time of moulting may vary this plumage greatly.

The reader however should not forget the changes of colour that Yarrell and others have shown to take place in the plumage of birds without change of feather, and where friction could hardly have been the agent.

Mr. Selby (1825), after the remarks already quoted, proceeds thus:—'Mr. Bewick however, in the Supplement to his work on British Birds, still continues to believe in the existence of two distinct species: for so we must understand him (although he has brought the synonyms of the two supposed species together), since in a note following the description and figure of his greater redpole, or brown linnet, he says that "it loses the red breast in autumn, and regains it in spring: in this it differs from the grey linnet, whose plumage remains the same at all seasons."' From his description of the Grey Linnet (the usual Northumbrian name of this bird) as given in the first volume of his work, it can be no other than the common or brown Linnet of a particular age, although he has attached to it the Linnean synonymes of the lesser redpole. 'If,' continues Mr. Selby, 'Mr. Bewick's observations on the plumage of the linnet were made upon caged birds, I am not surprised at his assertion of its always retaining the same appearance; for I have repeatedly verified the fact of its never acquiring, under confinement, those brilliant tints which distinguish it at a particular period of the year when in a state of liberty. I will adduce one instance strikingly to the point in question. For some particular purpose of observation, a linnet was shot more than two years ago, towards the close of summer, when the plumage showed its most perfect nuptial tints, and, happening to be only winged, it was put into a cage, where it soon became familiarized to its situation, and still continues. About the usual time, in the autumn of that year it moulted, and acquired the winter dress of the common or brown linnet, which it has retained ever since, without displaying at the accustomed season any of the brilliant red that adorned it in the wild state.'

Mr. Selby, who has given in his great work the figures of a male bird in summer plumage, and of the nat. size (pl. 55, fig. 1), and of a female, nat. size (ibid., fig. 4), collects the following synonyms for this species:—

Fringilla cannabina, Linn. Syst. 1, p. 322, sp. 28.
Gros-bec Linotte, Temm., *Man. d'Ornith.*, v. 1, p. 364.
Greater Redpole or Brown Linnet, Mont., *Ornith. Dict.*
The Linnet, Low's *Faun. Orcad.*, p. 53.
Greater Redpole, Flem. Shaw's *Zool.*, v. 9, p. 516.

Syn. of [illegible] male after the autumnal moult.	*Fringilla Linota*, Gmel., *Syst.* 1, p. 916; Lath. *Ind. Ornith.*, v. 1, p. 457, sp. 61. Linaria, Raii Syn., p. 90, A. 1; Will., p. 190; Id. (Ang.) 258: Briss., 3, p. 131, 29. La Linotte ordinaire, Buff., *Ois.*, v. 4, p. 58, t. 1; Id. *Pl. Enl.*, 151, f. 1. Common Linnet, *Br. Zool.*, No. 130; Lewin's *Br. Birds*, 2, t. 83; Lath., *Syn.* 3, p. 402, 79; Pult., *Cat. Dorset*, p. 12; Walc., *Syn.* 2, t. 221. Grey Linnet, Bewick's *Br. Birds*, 1, p. 171
Syn. of adult male in summer plumage.	*Fringilla cannabina*, Gmel., *Syst.* 1, p. 916, sp. 28; Lath., *Ind. Ornith.*, v. 1, p. 458, sp. 82. Linaria rubra major, Briss., 3, p. 135, 30; Raii Syn., p. 91, A. 2; Will., p. 191, t. 46. La grande Linotte des Vignes, Buff., *Ois.*, v. 4, p. 58; Id., *Pl. Enl.*, 485, f. 2, old male under the title of Petite Linotte des Vignes. Bluthänfling, Bechst., *Naturg. Deut.*, v. 3, p. 141; Id., *Taschenb. Deut.*, v. 3, p. 141; Id., *Taschenb. Deut.*, p. 121; Meyer, *Taschenb. Deut.*, v. 1, p. 163; Id., *Vög. Deut.*, v. 1, f. 1 and 2; Frisch., *Vög.*, t. 9, f. 1 and 2. Greater Redpole or Red-headed Linnet, *Br. Zool.*, 1, No. 131, t. 54; *Arct. Zool.*, 2, No. 161; Will. (Ang.), 260; Lewin's *Br. Birds*, 2, t. 84; Lath., *Syn.* 3, p. 304; Id., *Sup.*, p. 167; Walc., *Syn.* 2, t. 222; Pult., *Cat. Dorset*, p. 12; Bewick's *Br. Birds*, v. 1, t., p. 173; Id., *Sup.*, p., t. 22.

Mr. Gould, in his beautiful work on the Birds of Europe, figures a male in the spring or nuptial plumage, and a female of the nat. size, under the name of *Linaria cannabina, Le Gros-bec Linotte, Common or Brown Linnet*, and refers to Mr. Selby principally for the account of the changes of plumage. He also notices the confusion which formerly obtained about this species.

Varieties.—M. Temminck states that the bird varies accidentally to pure white; whitish, with the wings and tail as they are ordinarily; the colours feebly traced on the plumage; a part of the body white, or variegated with white feathers. All the plumage blackish, or more sombre than ordinary; the feet often red. He says that it is then *Fringilla Argentoratensis*, Gmel., *Syst.*, 1, p. 918, sp. 69; Lath., *Ind.*, v. 1, p. 460, sp. 87; *Le Gentyl de Strasbourg*, Buff., *Ois.*, v. 4, p. 73; Gérard, *Tab. élém*, v. 1, p. 194.

Geographical Distribution.—Very abundant in Holland. (Temm.) Very common throughout Britain, extending as far as to the Orkneys, where it is abundant. (Selby.) Indigenous to the British Islands, over the whole of which, and Europe generally, it is plentifully dispersed. (Gould.) Erzeroum in Persia. (Keith, Abbott.)

Habits, Food, Propagation.—In Britain resorting to waste lands and commons in the upper parts of the country, where it breeds. Assembling in winter in very large flocks, and descending to the sea-coasts, where these birds remain till pairing time stimulates them to seek the uplands. The food of the linnet consists of small seeds generally; those of the cruciform plants are favourites. The *nest* is built in a low bush, most frequently in furze, of moss and stalks of grass interwoven with wool, and lined with hair and feathers: *eggs*, 4 or 5, bluish-white dotted with purplish-red. (Selby principally.)

The bird is provincially termed Greater Redpole, Rose Linnet, Grey Linnet, Lintwhite, and Lintie. Bélon is of opinion that this species is the bird named *Salus* by the Latins, and Αἴγιθος (Ægithus) by Aristotle, in the fifteenth chapter of his nineteenth book ('Hist. Anim.'). The French and German names have been given above. It is the *Fanello* of the modern Italians, and *Llinos* and *Llinos bengoch* of the antient British.

The common Linnet is prized for its sweet song, and has been taught to imitate the human voice. The Hon. Daines Barrington mentions the celebrated talking Linnet at Kensington. He heard it repeat the words 'Pretty boy.'

Our limits will only permit a cursory notice of the other species generally considered as Linnets.

The Rev. Leonard Jenyns, in his 'Manual of British Vertebrata' (1835), makes the genus *Linaria* (Steph.) consist of *F. Linaria*, Linn. (Lesser Redpole); *F. cannabina*, Linn. (*Common Linnet;* Common or Brown Linnet of Selby, and Greater Redpole and Linnet of Montagu's 'Ornith. Dict.'); and *F. Montium*, Gmel. (*Mountain Linnet*).

Mr. Gould, in his 'Birds of Europe,' gives the following species of the genus *Linaria* of authors, in addition to the Common or Brown Linnet above noticed: *Linaria montana, Mountain Linnet*, or *Twite; Linaria canescens, Mealy Redpole;* and *Linaria minor, Lesser Redpole.*

The *Mountain Linnet* occurs in the catalogue given by M. Temminck, on the authority of Dr. Von Siebold and M. Burger, of European species of birds found in Japan, where it is known by the name of *Zuzume*. This is the *Gros-bec à gorge rouge, ou de montagne* of M. Temminck, and *Llinos fynydd* of the antient British.

The *Green Grosbeak* or *Greenfinch* (*Y Gegid, Llinos werdd* of the antient British) is sometimes called the *Green Linnet.* (FRINGILLIDÆ, vol. x.; GREENFINCH, vol. xi.)

LINSEED (*Graine de Lin*, French; *Leinsaat*, German; *Lynzaad*, Dutch; *Linaza*, Spanish; *Linhaça*, Portuguese; *Linseme*, Italian; *Semjalenjanoe*, Russian), the seed of the Lin, Linum, or flax plant, is a valuable product derived from the capsules of Linum usitatissimum, and consisting of small greyish-brown lenticular bodies, containing a mealy albumen, of so oleaginous a nature, that it yields by pressure in great abundance the oil of linseed. The seed of the flax plant is harvested not merely with a view to the reproduction of the plant, but also because of the oil which it yields by compression. For both these purposes, of sowing and crushing, linseed is largely imported into the United Kingdom. Linseed is also much used as food for small birds. The importations during each of the last ten years have been:—

1828 . 1,097,114 bushels.		1833 . 2,179,734 bushels.	
1829 . 2,052,239	"	1834 . 2,210,231	"
1830 . 1,080,971	"	1835 . 2,206,748	"
1831 . 2,739,193	"	1836 . 3,039,215	"
1832 . 1,995,072	"	1837 . 2,821,299	"

The principal part of these importations is from Russia; the quantities brought from that country in each of the last three years were 1,594,073, 2,109,530, and 2,132,634 bushels respectively, being very nearly seven-tenths of the whole importations. The remainder is received from other countries in the north of Europe, and principally from Prussia and Holland; from Italy, Turkey, and the United States of America; and within the last three years some shipments have been received from the territories of the East India Company. About one-fifth of the whole importation goes to Ireland, and is chiefly used for sowing. The best seed for this purpose is brought from Holland. The residuum of linseed from which the oil has been expressed is used, under the name of oil-cake, for fattening cattle. The duty paid on the importation of linseed into this country is 1½*d.* per bushel, and the price in our markets is usually from 46*s.* to 54*s.* per quarter of eight bushels. [Flax.]

LINSEED-OIL may be procured by cold expression of the seeds, a process which makes the oil clearer; or the bruised seeds are roasted in the oil-mills, in which case it is brownish-yellow, and easily becomes rancid, probably from attracting oxygen. Linseed-oil is pellucid, with a faint but peculiar odour and taste, generally disagreeable, from being subrancid. Specific gravity 0·93. It easily dries: by reduction of temperature it merely becomes cloudy, but scarcely freezes.

It may easily be purified by repeated agitation with water, by bleaching in the sun, or, better, by filtering it through newly prepared charcoal.

By long boiling it becomes dark-brown, tenacious, and thickened, but dries more easily, and in this state is used for printers' ink; by still longer boiling it becomes black, almost solid, and elastically tenacious, like caoutchouc, and in this state it serves for bird-lime.

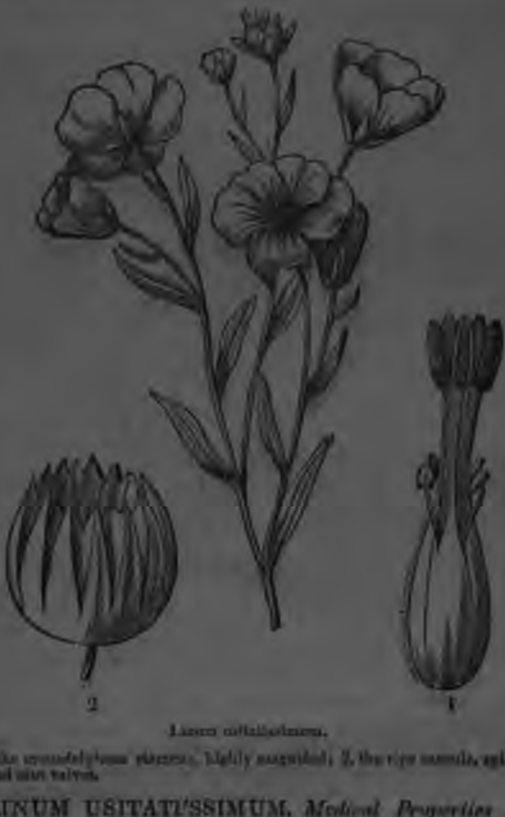
By the addition of nitrous acid it becomes thick and red, then dark reddish-brown, like tincture of iodine, but does not become solid. It is frequently adulterated with rape-oil, which may be detected by this test. Neither does it form elaidin, as rape-oil does. But a simpler test is, that if wood be besmeared with oil which has been adulterated, it does not become dry.

Linseed-oil is used to form liniments, of which the most common is that with lime-water, as an application to burns. But it is much more extensively used in the arts, particularly for painting.

LI'NTHURIS. [Foraminifera, vol. x., p. 348.]

LINU'CHIA. Eschscholtz gave this generic name to certain forms of the Linnæan genus Medusa. ('Actinologie,' p. 980.)

LINUM, a genus of plants which gives its name to the small family of *Lineæ*, and is characterized by having five distinct sepals, five petals, five stamens, and from three to five styles, which are either distinct from the base, or united as far as the middle, or even the apex. Capsule globular, divided into ten cells, each containing a single seed. Herbs or small shrubs; leaves entire, without stipules; flowers having the petals falling off shortly after flowering. The species are chiefly found in Europe and the north of Africa, but a few likewise in other parts of the world. Few however are of any importance, except that which has been an object of culture from the earliest times of which we have any record, that is *Linum usitatissimum*, or the flax-plant, which is valuable as well for its seed, as for the ligneous fibre of its cortical layer, which forms the tow spun into yarn and woven into linen cloth. [Flax; Linen.] It has been sometimes said that cotton is the substance from which cloth was made in Egypt in antient times. Cotton was no doubt known to the Hindus at very early periods, and may have formed an article of commerce to Egypt from India, but that it was not much used is proved by none of the mummy cloth, which has been examined by the best microscopes, being found to be composed of cotton. The seed is valuable for the condensed mucilage contained in its seed-coats, while the almond contains a fixed oil, valuable for burning, and in the arts as a drying oil; the oil-cake is used for fattening cattle. Linseed is extensively imported from Russia, Italy, and Egypt, for crushing, but of late years it has been imported in large quantities from India for the same purpose; this is found to yield a larger proportion of oil than Russian linseed, and the commerce will no doubt continue to increase. Seed is also imported from Holland, America, and other places for the purpose of sowing, as it is found to yield a finer and more abundant crop than the British seed. It is curious that the Hindus make no use of the ligneous fibre; but the plants, though they there produce fine seed rich in oil, are very dwarfish, and may not therefore be found profitable culture for a people who have cotton in such abundance, and who wove it into cloth in ages when even linen was unknown in Europe.



Linum usitatissimum.

1, the monadelphous stamens, highly magnified; 2, the ripe capsule, split at its end into valves.

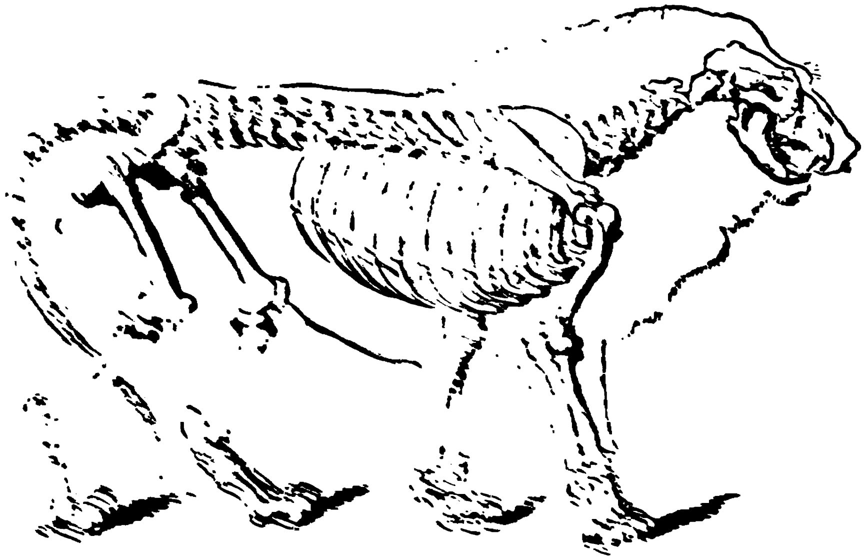
LINUM USITATI'SSIMUM. *Medical Properties of.* The seeds of this plant yield several articles useful in medicine and surgery. The testa, or husk of the seeds, is very mucilaginous, the kernel contains much oil, and the farina or meal, procured by grinding or bruising the seeds, after the oil has been expressed, furnishes an excellent material for poultices. [Cataplasms.] The seeds are oblongo-ovate, acute, compressed, brown, shining, very smooth, the skin thin, the kernel white and oily. They are devoid of odour, but have an unpleasant mucilaginous oily taste. Old, rancid, and corroded seeds should be rejected. One part of seeds and two parts of water yield a strong mucilage. It is much better to obtain the mucilage by merely pouring cold water on the entire seeds, than to bruise them and pour boiling water on them, as generally directed. The mucilage is analogous to that of the quince seed [Cydonia], and differs in its chemical habitudes, in several respects, from common gum. The compound infusion of linseed is demulcent, and the unpleasant taste may be much lessened by using cold water to form it, as stated above. The farina of the seeds, ground before the oil has been expressed, furnishes the best material for poultices, but does not keep well. The cake remaining after the expression of the oil is much used to fatten cattle, but gives a peculiar taste to the meat.

The lint, or charpie, used by surgeons to dress ulcers, &c., should always be prepared from linen-cloth and never from cotton, as an essential difference exists in the nature of their fibres, which causes that of cotton to prove extremely irritating.

LINZ, the capital of Upper Austria, in 48° 19' N. lat. and 14 [illegible] E. long., is agreeably situated at the junction of the Traun and the Danube, over which latter river there is a wooden bridge 864 feet long. It is divided into four sections, viz. the town and the three suburbs. The old town consists of one long street, and is of much less extent than the suburbs. There are four gates and three squares, in the largest of which there is 'the Pillar of the Trinity,' erected by the Emperor Charles VI. in 1723, and also two fountains. It is on the whole well built, for which it is not a little indebted to several fires, after which, the parts destroyed have been always much improved; this was especially the case after a very great fire in [illegible], which consumed the county hall, the castle, and many other buildings. There are seven churches, the largest of which is the cathedral, formerly belonging to the Jesuits. Other remarkable buildings are the government-house, the new county hall, where the provincial estates meet, a very magnificent edifice; the town-hall, built in 1414; the city brewery, the custom-house, the gymnasium, the handsome theatre, and the great imperial manufactory of woollen cloths and carpets, which in its most flourishing period gave employment, directly or indirectly, as it is stated, to 25,000 workmen, and used 5000 cwt. of wool annually. At present the number of workmen is only 10,500, exclusive of the numerous mechanics and artisans in Linz to whom it affords employment. It suffered severely by the French invasions. Linz is a bishop's see, and has a lyceum, with a library of 25,000 volumes, several public schools, a deaf and dumb asylum, and many charitable institutions. There are considerable manufactures of calico, dimity, leather, gunpowder, &c. The population of the town and suburbs, including some adjacent villages, is 23,500. It is a place of considerable trade, which the iron railroad to Budweis in Bohemia and the lately established steam-navigation of the Danube to the Black Sea must greatly increase. In order to defend Austria on the west, Linz was chosen for the execution of a new system of fortification invented by the Archduke Maximilian of Este.

LION, the English name for the form in which carnivorous development is generally considered to be the most perfect: Λέων (*Leon*) of the Greeks (Λέαινα, Lioness); *Leo* of the Romans (*Lea* and *Leæna*, Lioness); *Leone* of the Italians (*Leonessa*, Lioness); *Leon* of the Spanish; *Lion* of the French (*Lionne*, Lioness, *Lionceau*, whelp); *Löwe* of the Germans (*Löwinn*, Lioness). The male is, as a general rule, ornamented with a mane; the female has no such ornament.

ORGANIZATION.



[illegible]

[illegible]

[illegible]

in all the others the *foramen* was single on each side. (*Zool. Proc.*, 1834.)

Another communication to the same Society becomes interesting from its being associated with the popular belief that the lion lashes his sides with his tail to stimulate himself into rage. There was exhibited at one of the meetings (1832) a claw obtained from the tip of the tail of a young Barbary lion presented to the Society's menagerie by Sir Thomas Reade, then his majesty's consul at Tripoli. It was detected on the living animal by Mr. Bennett, and pointed out to the keeper, in whose hands it came off whilst he was examining it. The specimen having been submitted to Mr. Woods for description, that gentleman commenced by referring to the ancient writers quoted by Blumenbach. Homer (*Il.*, xx.), Lucan (*Pharsal.*, i. 208), Pliny (*Hist.*, viii.), among others, who had described the lion (erroneously) as lashing himself with his tail when angry, or to provoke himself to rage. None of these writers however, he remarked, advert to any peculiarity in the Lion's tail to which so extraordinary a function might, however incorrectly, be attributed; but Didymus Alexandrinus, a commentator on the 'Iliad,' cited by Blumenbach, having found a black prickle like horn among the hair of the tail, immediately conjectured that he had ascertained the true cause of the stimulus when the animal flourishes his tail in defiance of his enemies, remarking that when punctured by this prickle the Lion becomes more irritable from the pain which it occasions. Mr. Woods then noticed the oblivion into which the subject fell for centuries till Blumenbach, who observes also that the later commentators, Heyne for instance, had noticed the opinion above stated, revived it (now about twenty-six years since). Blumenbach having verified the accuracy of Didymus Alexandrinus as to the fact, though he did not admit the commentator's inference, Blumenbach described the prickle as small, dark-coloured, hard as horn, placed in the very tip of the Lion's tail, surrounded at its base by an annular fold of the skin, and adhering firmly to a singular follicle of a glandular appearance. But Blumenbach remarked that these parts were so minute, and the small horny apex so buried in the tuft of hair, that the use attributed to it by the ancient scholiast can only be regarded as imaginary. Again, according to Mr. Woods, the subject appears to have slumbered till 1829, when M. Deshayes announced (*Ann. des Sci. Nat.*, vol. vii.) that he had found the prickle both of a Lion and Lioness which died in the French menagerie, and described it as a little nail or horny production, about two lines in length, presenting the form of a small cone, a little recurved upon itself, and adhering by its base only to the skin and not to the last caudal *vertebra*, from which it was separated by a space of two or three lines. From that period Mr. Woods suffered no opportunity to escape him of examining the tails of every Lion, living or dead, to which he could gain access; but in no instance had he succeeded in finding the prickle till the specimen which was then before the committee was placed in his hands, within half an hour after its removal from the living animal, and while yet soft at its base where it had been attached to the skin. He described it as formed of corneous matter like an ordinary nail, and solid throughout the greater part of its length towards the *apex*, where it is sharp; and at the other extremity as hollow, and a little expanded. Its shape was rather singular, being nearly straight for one-third of its length, then slightly constricted (forming a very obtuse angle at the point of constriction), and afterwards swelling out like the bulb of a bristle to its termination. It was laterally flattened throughout its entire length, which did not amount to quite three-eighths of an inch. It was of a horn-colour, but became darker, nearly to blackness, at the tip. Its appearance, Mr. Woods observed, would lead to the belief that it was deeply inserted into the skin, with which however, from the readiness with which it became detached, its connexion must have been very slight. It is to this slightness of adhesion that M. Deshayes attributes its usual absence in stuffed specimens; and the same cause will account for its absence in by far the greater number of living individuals; for, as Mr. Woods remarked, its presence or absence does not depend upon age, because the Paris lions in which it was found were of considerable size, while that belonging to the Society was very small and young; nor upon sex, for although wanting in the female cub of the same litter at the Society's Gardens, it existed in the Lioness at the Jardin du Roi.

Mr. Woods, thinking it probable that these prickles might exist in other species of *Felis*, had previously examined the tails of nearly the whole of the stuffed skins in the Society's museum, but failed in detecting it in every instance but one. This was an adult Asiatic leopard, in which the nail was evident, although extremely small. It was short and straight, and perfectly conical, with a broad base. Mr. Woods observed that it was stated in a note in the 'Edinburgh Philosophical Journal,' where a translation of Blumenbach's paper had been given, that a claw or prickle had also been observed by the editor of that work on the tail of a leopard. No such structure however was detected by Mr. Woods on a living individual in the Society's menagerie. In the leopard therefore, as in the lion, it appears to be only occasionally present. In both it is seated at the extreme tip of the tail, and is altogether unconnected with the terminal caudal vertebra. From the narrowness and shape of its base, the circumference of which is by far too small to allow of its being fitted like a cap upon the end of the tail, it appeared to Mr. Woods rather to be inserted into the skin, like the bulb of a bristle or *vibrissa*, than to adhere to it by the margin, as described by M. Deshayes. Neither the published observations of that zoologist nor the discovery then communicated to the Society could, it was observed, throw any light on the existence or structure of the supposed glandular follicle noticed by Blumenbach.

Mr. Woods concluded by remarking that it is difficult to conjecture the use of these prickles, their application as a stimulus to anger being of course out of the question; but he observed that it could not be very important, for, to say nothing of their small size and envelopment in the fur, the majority of individuals, in consequence of the readiness with which the part is detached, are deprived of it for the remainder of their lives. (*Zool. Proc.*, 1832.)*

Prickle at the end of Lion's tail. (Blumenbach.)

Emasculation, it is stated, prevents the development of the mane; and the Lion so mutilated is said never to roar.

GEOGRAPHICAL DISTRIBUTION.

The true Lions belong to the Old World exclusively, and they were formerly widely and plentifully diffused; but at present they are confined to Asia and Africa, and they are becoming every day more and more scarce in those quarters of the globe. That Lions were once found in Europe there can be no doubt. Thus it is recorded by Herodotus that the baggage camels of the army of Xerxes were attacked by Lions in the country of the Pæonians and Crestonæ, on their march from Acanthus (near the peninsula of Mount Athos) to Therme, afterwards Thessalonica (now Saloniki): the camels alone, it is stated, were attacked, other beasts remaining untouched as well as men. The same historian also observes that the limits in Europe within which Lions were then found were the Nessus or Nestus, a Thracian river running through Abdera, and the Achelous, which waters Acarnania. (Herod., vii., c. 125-126, Schweighæuser; and see the article ATHOS, p. 23.) Aristotle (vi. 31) says that the Lion is in fact an animal but little known. 'In the whole of Europe, for example, there are no Lions, except between the Achelous and the Nessus.' Again, the same author (viii., xxviii., 33 of Scaliger's division) mentions Europe as abundant in Lions, and especially in that part which is between the Achelous and Nessus; apparently copying the statement of Herodotus. Pliny (viii. 16) does the same, and adds that the Lions of Europe are stronger than those of Africa and Syria. Pausanias copies the same story as to the attack of the Lions on the camels of Xerxes; and he states moreover that Lions often descended into the plains at the foot of Olympus, which separates Macedonia from Thessaly, and that Polydamas, a celebrated athlete, a contemporary of Darius Nothus, slew one of them, although he was unarmed. The passage in Oppian (*Cyneg.*, iii. 22) which some have considered as indicating the existence of Lions up to the banks of the Danube, fails as an authority for placing the Lion in that locality, because, as Cuvier observes, the context shows plainly that the name of Ister is there applied to an Armenian river, either by an error of the author or of the transcribers.

---

* And see post, description of the Maneless Lion of Guzerat, p. 32.

Nor is Europe the only part of the world from which the form of the Lion has disappeared. Lions are no longer to be found in Egypt, Palestine, or Syria, where they once were evidently far from uncommon. The frequent allusions to the Lion in the Holy Scriptures and the various Hebrew terms there used to distinguish the different ages and sex of the animal (see particularly *Jer.*, li., 38; *Ezek.*, xix., 2; *Nah.*, ii., 13, גור, *Gor*, a little Lion or Lion's whelp: *Ezek.*, xix., 2, 3; *Psalm* xci., 13; *Prov.*, xix., 12, &c.; כפיר, *Chephir*, a weaned Lion, that is able to leave the mother and hunt prey for itself: *Nah.*, ii., 12, &c.; ארי, *Ari*, a full-grown strong Lion, the most general name: *Job.*, iv., 10; x., 16; *Psalm* xci. 13; *Prov.*, xxvi., 13; *Hosea*, v. 14; xiii. 7; שחל, *Shacal*, a Lion in his prime, a black Lion: *Job*, iv., 10; *Prov.*, xxx., 30; ליש, *Laish*, a ferocious or angry Lion; compare the Greek *lis*, λῖς: see also *Job*, iv. 10, 11, &c.), prove a familiarity with the habits of the race. Even in Asia generally, with the exception of some countries between India and Persia and some districts of Arabia, these magnificent beasts have, as Cuvier observes, become comparatively rare, and this is not to be wondered at. To say nothing of the immense draughts on the race for the Roman arena,—and they were not inconsiderable, for, as Zimmerman has shown, there were a thousand Lions killed at Rome in the space of forty years,*—population and civilization have gradually driven them within narrower limits, and their destruction has been rapidly worked in modern times when fire-arms have been used against them instead of the bow and the spear. The African Lion is annually retiring before the persecution of man farther and farther from the Cape. Mr. Bennett (*Tower Menagerie*) says of the Lion: 'His true country is Africa, in the vast and untrodden wilds of which, from the immense deserts of the north to the trackless forests of the south, he reigns supreme and uncontrolled. In the sandy deserts of Arabia, in some of the wild districts of Persia, and in the vast jungles of Hindostan, he still maintains a precarious footing; but from the classic soil of Greece, as well as from the whole of Asia Minor, both of which were once exposed to his ravages, he has been utterly dislodged and extirpated.'

LIONS OF THE OLD WORLD.

Zoologists generally distinguish the Lion by its uniform yellow colour, the tuft of hair at the end of the tail, and the mane covering the head and shoulders of the male. This last ornament, as we shall presently see, is very much reduced in one variety, with which we have lately been made well acquainted by Captain Smee; indeed so scanty is it that it hardly deserves the name of a mane at all.

If we go back to an early period, we shall find varieties of this great cat, usually considered as the strongest of the family, depending on the greater or less intensity of colour for the most part, mentioned by antient writers on natural history. Thus Aristotle (ix. 44) distinguishes two kinds of Lions, one rounder than the other (στρογγυλώτερον), and which has the mane more curled (οὐλοτριχώτερον), which he states to be the most timid (δειλότερον); the other longer and with a well-developed mane (εὔτριχον), which he says is the more courageous (ἀνδρειότερον). Pliny (viii. 16) remarks that the Lion is most noble when a mane covers his neck and shoulders; and he also (loc. cit.) alludes to a maneless Lion, the offspring of a monstrous connexion. ('Leoni præcipua generositas, tunc cum colla armosque vestiunt jubæ. Id enim ætate contingit e leone conceptis. Quos vero pardi generavere, insigni hoc carent.') In Africa, he goes on to remark, such connexions are frequent: 'Multiformes ibi animalium partus, varie fœminis cujusque generis mares aut vi aut voluptate miscente;' whence, he adds, the Greek vulgar saying, that Africa is always producing something new. In the same chapter Pliny, after alluding to the European Lions and their comparative boldness, as above stated, repeats the observation of Aristotle, that there are two kinds of Lions, one compact and short with curled mane, which are more timid than those with a long and simple one ('longo simplicique villo'); which last despise the wounds inflicted on them. In the 17th chapter of the same book, Syria is stated to be the locality of a black Lion (see opposite column): 'cæteris unus cujusque generis color est. Leonum tantum in Syria niger.' Ælian (xvii. 26) distinguishes the Lions which come from India from other Lions, stating that the skin of the Indian Lions is black. Oppian (iii.), towards the beginning of that book, notices the differences between the Lions of Armenia, Arabia (Ἐρεμβῶν ἄρουρα), Libya, and Ethiopia.

These distinctions are altogether rejected by Buffon, who denies that there are different kinds of Lions. He denies, also, that any Lion has a curled mane, which, by the way, Aristotle does not assert, for he only says that one kind has the mane *more curly* than the other. Buffon further affirms, that the Lions of Africa and Asia entirely resemble each other; and declares that if the Lions of the mountains differ from those of the plains, the difference is less in the colour of the skin than in the size of the respective animals.

Linnæus, in his last edition of the 'Syst. Nat.,' notices no varieties: he places *Felis Leo* at the head of his genus *Felis*, with Africa only as the *habitat*. Neither does Gmelin distinguish any varieties, but he much increases the distribution; for he speaks of the Lion as inhabiting Africa, especially in the interior, as being rarer in the deserts of Persia, India, and Japan, and as having formerly occurred in other warmer parts of Asia, in Palestine, in Armenia, and in Thrace.

Pennant ('Hist. Quadr.,' 3rd edition) appears to coincide in opinion with Buffon, Linnæus, and Gmelin; for he mentions no distinctions, and describes the Lion as 'an inhabitant of most parts of Africa, and rarely of the hot parts of Asia, such as India and Persia; and a few are still met with in the deserts between Bagdat and Bassorah, on the banks of the Euphrates. Mr. Niebuhr also places them among the animals of Arabia; but their proper country is Africa, where their size is the largest, their numbers greatest, and their rage more tremendous, being inflamed by the influence of a burning sun upon a most arid soil. Doctor Fryer says that those of India are feeble and cowardly. In the interior parts, amidst the scorched and desolate deserts of Zaara, or Biledulgerid, they reign sole masters; they lord it over every beast, and their courage never meets with a check, where the climate keeps mankind at a distance; the nearer they approach the inhabitants of the human race, the less their rage, or rather the greater is their timidity; they have often experienced the unequal combat, and finding that there exists a being superior to them, commit their ravages with more caution; a cooler climate again has the same effect; but in the burning deserts, where rivers and fountains are denied, they live in a perpetual fever, a sort of madness fatal to every animal they meet with.'

Dr. Leach raised the form to the rank of a genus under the name of *Leo*.

M. Lesson, in his 'Manuel' (1827), gives four varieties, viz. the Lion of Barbary, the Lion of Senegal, the Lion of Persia or Arabia, and the Lion of the Cape.

Cuvier ('Règne Animal,' his last edit., 1829) places at the head of the great genus Felis '*Le Lion* (*Felis Leo*, Linn.)' and describes it as distinguished by its uniform yellow colour, the tuft of hair at the end of the tail and the mane which covers the head, neck, and shoulders of the male. 'It is,' continues Cuvier, 'the strongest and the most courageous of the animals of prey. Spread, at one time, over all the parts of the antient world, it would appear at the present day nearly confined to Africa and some neighbouring parts of Asia.'

M. Temminck, in his 'Monograph,' includes three varieties under *Felis Leo*, namely the Lions of Barbary, Senegal, and Persia, and these are retained in Dr. Fischer's Synopsis.

Mr. Bennett ('Tower Menagerie,' 1829) notices the Bengal Lion, the Cape Lion, and the Barbary variety (figuring the two former), and observes upon their distinctions.

Sir William Jardine (*Naturalists' Library*, 'Mammalia,' vol. ii., *Felinæ*, 1834), in addition to other plates, has given a figure of the Asiatic variety from a specimen in the Surrey Zoological Gardens, and after noticing that the Lions of Africa and India have been described as varieties, states his strong suspicions that future observations will prove these animals to be in reality distinct species, and notices them separately under the names of *Leo Africanus* and *Leo Asiaticus*; he also alludes to the *Maneless Lion*, a notice of which had just appeared in the proceedings of the Zoological Society of London, with a promise of further details in the Transactions of that Society, in a paper which has since been published, and to which we shall presently call the reader's attention.

---

* Sylla gave a combat of one hundred lions at once in his ædileship; but this hundred, at least in number, was small when compared with those of Pompey and Cæsar, the former of whom exhibited a fight of six hundred, and the latter of four hundred. In Pompey's show, three hundred and fifteen of the six hundred were males. The later emperors consumed great numbers, frequently a hundred at a time, to gratify the people.

Mr. Swainson (*Classification of Quadrupeds*, 1835) places 'the African Lion (*Leo Africanus*, Sw.) at the head of the *Felidæ*. In his arrangement at the end of the volume he notices the form under the designation of 'Leo Antiquorum. *Lions.* Head and neck furnished with a mane of long hair; tail tufted.' The next genus, 'Felis L., Cats,' he characterizes thus: 'No mane; tail long, not tufted.' In his 'Animals in Menageries,' 1838, the Lion does not appear to be noticed.

African Lions.—Temminck notices two varieties of the *African Lion*—that of *Barbary* and that of *Senegal*. M. Lesson adopts these two varieties, and adds the *Lion of the Cape*, of which he gives two varieties.

The Lion of Barbary.—This Lion is described as having a deep yellowish-brown fur, and the mane of the male is stated to be very much developed.

The Lion of Senegal is characterized by a fur of a more yellow tint, the mane in the male being less thick, and nearly wanting upon the breast and insides of the legs.

The Lion of the Cape presents two varieties, one yellowish and the other brown; the latter is regarded as the most ferocious and formidable. The Dutch colonists speak of the 'Blue and the Black' kinds, and it seems indeed that there is a 'black-maned' Lion, one of which, accompanied by his Lioness, Mr. Burchell appears to have encountered in his travels in Africa. (See post.)

Habits, Chase, &c.—Mr. Burchell well observes, that 'King of the Forest' is a title not very applicable to an animal which he, at least, never met but on the plains; nor did he ever meet with one in any of the forests where he had been. The low cover that creeps along the sides of streams, the patches that mark the springs or the rank grass of the valley, seem to be the shelter which the African Lion for the most part seeks. Of the strength of this variety we have most extraordinary examples on record. To carry off a man,—and there are dismal accounts of this horrible fact, which there is no reason to doubt,—appears to be a feat of no difficulty to this powerful brute. Indeed when we find that a Cape Lion seized a heifer in his mouth, and, though the legs dragged upon the ground, seemed to carry her off with the same ease as a cat does a rat, leaping over a broad dike with her without the least difficulty,—that another, and a young one too, conveyed a horse about a mile from the spot where he had killed it—and that a third, which had carried off a two-year old heifer, was followed on the spoor, or track, for five hours by horsemen, when it appeared that throughout the whole distance the carcass of the heifer was only once or twice discovered to have touched the ground,*—the asportation of a man shrinks into insignificance as a demonstration of strength. There seems to be an idea that the Lion prefers a human prey; but be this as it may, the inhabitants of certain districts have, it appears, been under the necessity of resorting to a curious expedient to get out of their reach. Messrs. Schoon and M'Luckie, in 1829, penetrated to the eastward of Kurrichaine, situated about 200 miles to the north-east of Litakou. They discovered, east of Kurrichaine, or Chuan, as it is more properly named, the *river Marequa*, which rises in the south between the 25th and 26th degrees of latitude, and 29th and 30th degrees of longitude, taking a north-easterly course, and about 100 miles from the ford enters a high ridge of mountains. From hence, according to the natives, it flows into the sea, through the country of the Mantatees. About 70 miles to the eastward, the range of mountains takes a direction north and south. At the distance of 14 miles to the south, along the base of the mountains, is a place called '*Ongorutcie Fountain*,' where there is a large tree containing seventeen conical huts. These are used as dormitories, being beyond the reach of the Lions, which, since the incursion of the Mantatees, when so many thousands of persons were massacred, have become very numerous in the neighbourhood and destructive to human life.† The branches of these trees are supported by forked sticks or poles, and there are three tiers or platforms on which the huts are constructed. The lowest is nine feet from the ground, and holds ten huts; the second, about eight feet high, has three huts; and the upper story, if it may be so called, contains four. The ascent to these is made by notches cut in the supporting poles, and the huts are built with twigs thatched with straw, and will contain two persons conveniently. The travellers had previously visited several deserted villages similarly built between the Marequa and [illegible] rivers, as well as in other places. But these were erected on stakes about eight feet above the ground and about forty feet square, larger in some places, and containing about seventy or eighty huts. The inhabitants sit, it is stated, under the shade of these platforms during the day, and retire to the elevated huts at night.*

The general prey of the African Lion consists of the larger herbivorous quadrupeds, very few of which it is unable to master, and it is a severe scourge to the farmer, who is consequently ever on the look-out for lions, and generally a most imperturbable and unerring shot. Though mortal accidents frequently happen in these huntings, the cool sportsman seldom fails of using his rifle with effect. Lions when roused, it seems, walk off quietly at first, and if no cover is near, and they are not pursued, they gradually mend their pace to a trot, till they have reached a good distance, and then they bound away. Their demeanour upon these occasions has been described to us by eye-witnesses to be of a careless description, as if they did not want a fray, but if pressed, were ready to fight it out. If they are pursued closely, they turn and couch, generally with their faces to the adversary; then the nerves of the sportsman are tried. If he is collected and master of his craft, the well directed rifle ends the scene at once; but if, in the flutter of the moment, the vital parts are missed, or the ball passes by, leaving the lion unhurt, the infuriated beast frequently charges on his enemies, dealing destruction around him. This however is not always the case, and a steady unshrinking deportment has, in more instances than one, saved the life of the hunter. Mr. Burchell gives an interesting account in his African travels of his confronting one of these animals. 'The day was exceedingly pleasant, and there was not a cloud to be seen. For a mile or two, we travelled along the banks of the river, which, in this part, abounded in tall mat-rushes. The dogs seemed much to enjoy prowling about, and examining every bushy place, and at last met with some object among the rushes which caused them to set up a most vehement and determined barking. We explored the spot with caution, as we suspected, from the peculiar tone of their bark, that it was what we suspected it to be,—lions. Having encouraged the dogs to drive them out, a task which they performed with great willingness, we had a full view of an enormous black-maned lion and lioness. The latter was seen only for a minute, as she made her escape up the river, under the concealment of the rushes; but the lion came steadily forward and stood still to look at us. At this moment we felt our situation not free from danger, as the animal seemed preparing to spring upon us, and we were standing on the bank, at the distance of only a few yards from him, most of us being on foot and unarmed, without any visible possibility of escaping. I had given up my horse to the hunters, and was on foot myself; but there was no time for fear, and it was useless to attempt avoiding him. . . . I stood well upon my guard, holding my pistols in my hand, with my finger upon the trigger; and those who had muskets kept themselves prepared in the same manner. But at this instant the dogs boldly flew in between us and the lion, and surrounding him, kept him at bay by their violent and resolute barking. The courage of those faithful animals was most admirable; they advanced up to the side of the huge beast, and stood making the greatest clamour in his face, without the least appearance of fear. The lion, conscious of his strength, remained unmoved at their noisy attempts, and kept his head turned towards us. At one moment, the dogs perceiving his eye thus engaged, had advanced close to his feet, and seemed as if they would actually seize hold of him; but they paid dearly for their imprudence, for, without discomposing the majestic and steady attitude in which he stood fixed, he merely moved his paw,

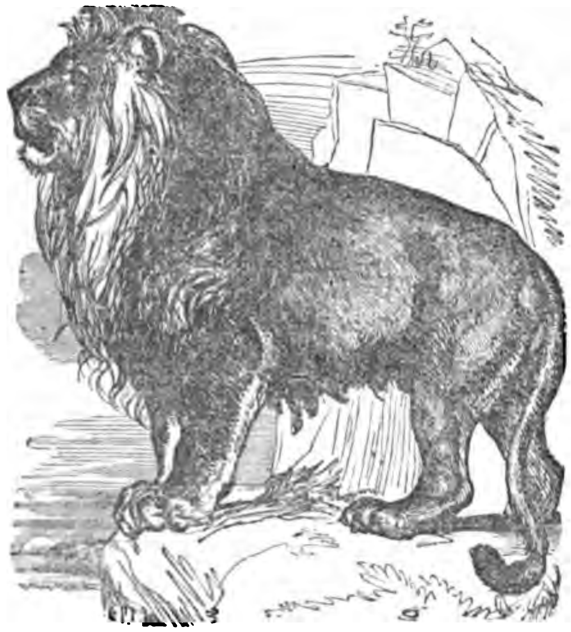
---

[*] Sparrman; Thompson.

[†] [illegible] (viii. 16) records the extinction of a Libyan people by an invasion of lions.

[*] See 'South African Journal,' September, 1830; and Steedman's 'Wanderings and Adventures in the Interior of Southern Africa,' where the reader will find a drawing of the inhabited tree above described, taken by Mr. Moffat of Litakou, who also visited this spot.

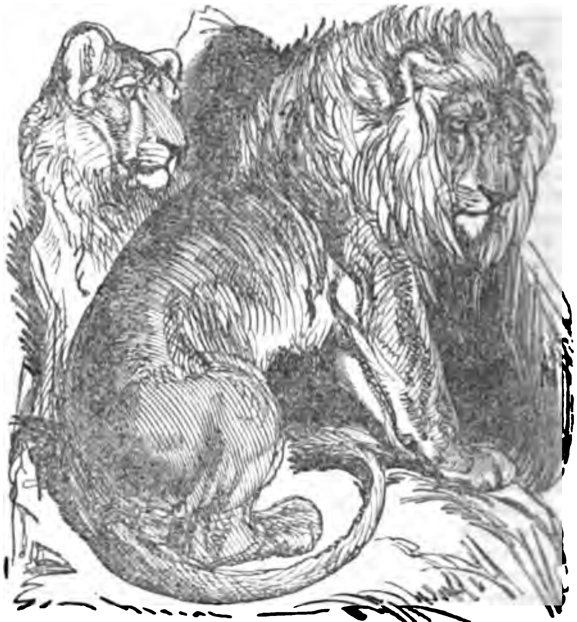
and, at the next instant, I beheld two lying dead. In doing this he made so little exertion, that it was scarcely perceptible by what means they had been killed. Of the time which we gained by the interference of the dogs, not a moment was lost: we fired upon him; one of the balls went through his side, just between the short ribs, and the blood began to flow, but the animal still remained standing in the same position. We had now no doubt that he would spring upon us: every gun was instantly reloaded; but happily we were mistaken, and were not sorry to see him move quietly away, though I had hoped in a few minutes to have been enabled to take hold of his paw without danger.' Even where the hunter has been seized with a panic and pursued, a timely recovery of self-possession has saved him. Sparrman relates that Jacob Kok of Zee-koe-rivier, one day walking over his lands with his loaded gun, unexpectedly met a lion. Being an excellent shot, he thought himself pretty certain, from the position in which he was, of killing it, and therefore fired his piece. Unfortunately he did not recollect that the charge had been in it for some time, and consequently was damp; so that his piece hung fire, and the ball falling short, entered the ground close to the lion. In consequence of this he was seized with a panic and took directly to his heels; but being soon out of breath and closely pursued by the lion, he jumped up on a little heap of stones, and there made a stand, presenting the butt end of his gun to his adversary, fully resolved to defend his life as well as he could to the utmost. This deportment had such an effect on his pursuer, that he also made a stand, and lay down at the distance of a few paces from the heap of stones, seemingly quite unconcerned. Jacob, in the mean time, did not stir from the spot; besides he had in his flight unfortunately dropped his powder-horn. At length, after waiting a good half-hour, the lion rose up, and at first went very slowly, and step by step only, as if he had a mind to steal off; but as soon as he got to a greater distance, he began to bound away at a great rate. There is hardly a book of African travels which does not teem with the dangers and hair-breadth escapes of the lion-hunters, and hardly one that does not include a fatal issue to some engaged in this hazardous sport; but our limits will not allow us to enter into further details on this part of the subject, and we must refer to such works for accounts—and they are very interesting—of the different modes of destruction employed against this powerful beast, from the poisoned arrow of the Bushman to the rifle of the colonist.



African Lion. (Barbary.)

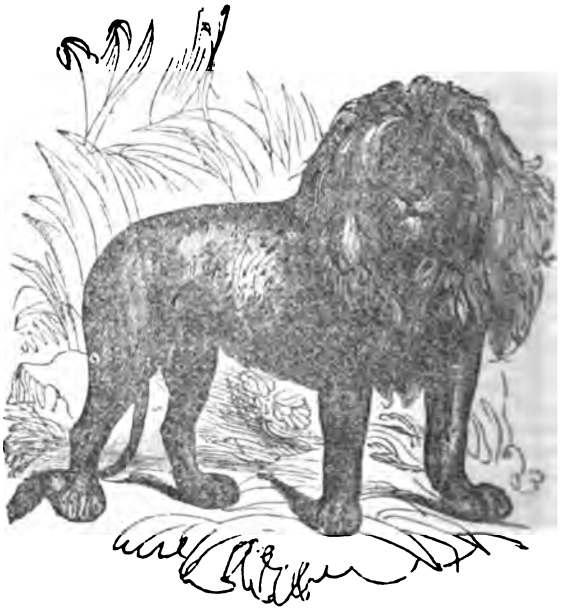
Asiatic Lions.—Of these, three kinds are mentioned:—The *Bengal Lion*, the *Persian* or *Arabian Lion*, and the *Maneless Lion* of Guzerat.

The Bengal Lion.—Mr. Bennett points out the characteristics by which the Asiatic race is distinguished from that of Southern Africa, as consisting principally in the larger size, the more regular and graceful form, the generally darker colour, and the less extensive mane of the African. He gives a beautiful cut of the Bengal Lion, executed by Harvey, in the 'Tower Menagerie,' from a very fine specimen little more than five years old, then in that collection, but called by the keepers 'The Old Lion.' The magnificent development of the mane is very striking in this figure.



Lion (mane not quite fully developed) from Eastern Asia, with Lioness.

The Persian or Arabian Lion.—This is stated to be distinguishable by the pale Isabella colour of the fur, and those which have been exhibited in England as Persian Lions certainly bear out this remark; but Captain Smee, to whose interesting paper we shall presently have to call attention, observes that the *Persian Lion* exhibited at the Surrey Zoological Gardens seemed to him to differ but little from individuals known to be brought from Africa. (See the next section.)



Persian Lion.

The Maneless Lion of Guzerat.—The reader will bear in mind the passage above quoted from Pliny (viii. 16), touching Lions which have no mane, and of the origin attributed to them. Cuvier notices the statement, that maneless lions had been found on the confines of Arabia, and merely refers to Olivier, observing that there is no detailed description given of them. A zoological description is doubtless not to be found in Olivier; but he enters somewhat minutely into the subject, as the reader will here see. 'The Lion,' says Olivier (*Voyage dans l'Empire Othoman, l'Egypte, et la Perse*, tom. iv.), 'which inhabit the part of Arabia and Persia near the rivers of the Arabs, from the Persian Gulf to the environs of Hella and of Bagdad, is probably the species of Lion of which Aristotle and Pliny have spoken, and which they regarded as a different species from that which is spread over the interior of Africa. The Lion of Arabia has neither the courage, nor the stature, nor even the beauty of the other. When he would seek his prey he has recourse to cunning rather than force; he wanders among the reeds which border the Tigris and Euphrates, and springs upon all the feeble animals which come there to quench their thirst, but he dares not to attack the boar which is very common there, and flies as soon as he perceives a man, a woman, or even a child. If he catches a sheep, he makes off with his prey; but he abandons it to save himself, when an Arab runs after him. If he is hunted by horsemen, which often happens, he does not defend himself, unless he is wounded and has no hope of safety by flight. In such a case he will fly at a man and tear him to pieces with his claws; for it is courage more than strength that he wants. Achmed, pasha of Bagdad from 1724 to 1747, would have been torn by one, after breaking his lance, in a hunt, if his slave Soleiman, who succeeded him in the pashalik, had not come promptly to his succour, and pierced with a blow of his yataghan the lion already wounded by his master.'

'We saw,' continues Olivier, 'five individuals of this race in the menagerie of the pasha of Bagdad; they had been there five years and had been taken young in the environs of Bassora: there were three males and two females; the former were a little larger than the latter; and all much resembled the African species, excepting that they were smaller and had no mane. We were assured that they never had any, and that no lion of these countries had one. We have often regretted that we did not ask the pasha for two of them, in order to a close comparison with the African species, and to satisfy ourselves whether the lion of Arabia ought to be regarded as a species distinct from the other, or as a degenerated race.'

In Griffith's Cuvier ('Règne Animal') there is a notice that a maneless and brownish coloured species of *Felis*, larger than a *Lion*, had been expected to be forwarded from *Nubia* to the Frankfort Museum.

In December 1833, Captain Walter Smee exhibited to a meeting of the Zoological Society of London the skins of a Lion and Lioness killed by him in Guzerat, and selected from eleven obtained there by him, eight of which he had brought to this country. This Lion, he stated, is distinguished from those previously known by the absence of a mane (that is, it is maneless as compared with other Lions), from the sides of the neck and shoulders, the middle line of the back of the neck being alone furnished with longer hairs, which are erect, like those in the same situation in the Cheetah (*Felis jubata*). The under surface of the neck has long loose silky hairs, and there is a tuft at the angle of the anterior legs. Besides the absence of the extensive mane, the tail is shorter than that of ordinary Lions, and is furnished at its tip with a much larger brush or tuft. In this tuft there existed in the oldest of Captain Smee's Lions, subsequently to the arrival of the skin in England, a short horny claw or nail, similar in form to, but somewhat larger in size than, that described by Mr. Woods, and above alluded to.

Captain Smee, who in the Transactions of the Zoological Society, enters into a very minute description of the arrangement of the hair in this variety, both in the male and the female, observes that both the *African* and *Guzerat Lion* are subject to considerable variations in intensity of colouring. In both the colour is fulvous; but in some individuals, he says, this is much paler than in others, and in the darker specimens there occurs a tinge of red. The middle of the back is the most deeply coloured part, and the under surface is much paler and almost white. Among the hairs there is an intermixture of some which are entirely black, and the greater or less proportion which these bear to the other ones is the principal cause of the variations in depth of colour that occur in different individuals. Of the *Guzerat Lions* the oldest individual is the lightest in colour. The tail becomes gradually paler towards its extremity, nearly into yellowish white; its terminal brush consisting of black hairs slightly fringed with brown. Above each eye is a pale space, in which is included a darker coloured spot for the implantation of the supraciliary *vibrissæ*, from twelve to fifteen in number, out of which the longest reached nearly to the ears. In the *African Lion* these *vibrissæ* are implanted in a darker spot, but this spot is less defined, and is only partially bounded by a paler space. In both the points of insertion of the mustachios are darker than the surrounding parts. Captain Smee does not speak with certainty of the comparative form of these two varieties, but he states his impression to be that the *Lion of Guzerat* is comparatively more rounded and bulky in its body, and rather shorter in its limbs; and that its head especially is shorter, has less of the square form which distinguishes the same part of the male *African Lion*, and is more rounded on the forehead. But, as he observes, this difference may be chiefly owing to the long hairs which conceal the forehead in the one, while that feature is defined and visible in the other. The *cranium* of the Lion of Guzerat generally resembles that of the *African* race. Mr. Owen had remarked that the infra-orbital foramina were double in the only skull known to be Asiatic examined by him: in one, killed in North Guzerat, this occurs on both sides; in the other, killed near Assund, it is found on one side only. Captain Smee states that in a young skull of the *Maneless Lion* there exists on one side a double infra-orbital *foramen*, and that the existence of the same structure in another skull contained in one of the skins had been ascertained. A male maneless Lion killed by Captain Smee measured, including the tail, 8 feet 7½ inches in length, and his total weight, exclusive of the entrails, was 35 stone (14 lbs. to the stone): the impression of his paw on the sand measured 6½ inches across, and his height was 3 feet 6 inches. A female killed at the same time was 8 feet 7 inches long and 3 feet 6 inches high.

Locality and Habits of the Guzerat Lion.—These maneless Lions are, according to the author last above quoted, found in Guzerat along the banks of the Sumbermuttee near Ahmedabad. During the hot months they inhabit the low bushy wooded plains that skirt the Bhardar and Sumbermuttee rivers from Ahmedabad to the borders of Cutch, being driven out of the large adjoining tracts of high grass jungle (called Bheer) by the practice annually resorted to by the natives of setting fire to the grass, in order to clear it and ensure a succession of young shoots for the food of the cattle upon the first fall of the rains. They extend through a range of country about 40 miles in length, including various villages, and among others those of Booroo and Gollana, near which Captain Smee killed his finest specimens. They were so common in this district that he killed no fewer than eleven during a residence of about a month; yet scarcely any of the natives, except the cattle-keepers, had seen them previously to his coming among them. The cattle were frequently carried off or destroyed, but this they attributed to *Tigers*. Captain Smee however observes, that the Tiger does not exist in that part of the country. Those natives to whom the Lions were known gave them the name of *Ountiah Bang*, or *Camel Tiger*, an appellation derived from their resemblance in colour to the Camel. They appear to be very destructive to the domesticated cattle, and the remains of a considerable number of carcases of bullocks were found near the place where Captain Smee's specimens were killed: about ten days previously, four donkeys had been destroyed at the village of Cashwah. Captain Smee could not learn that men had been attacked by them. When struck by a ball, they exhibited great boldness, standing as if preparing to resist their pursuers, and then going off slowly and in a very sullen manner; unlike the Tiger, which on such occasions retreats springing and snarling. Captain Smee states that these Lions are also found on the Rhun near Rhunpoor, and near Puttun in Guzerat, and that some persons who saw them in Bombay said that they also occur in Scind and in Persia; he further observes, that should subsequent inquiries prove that Olivier was correctly informed as to the locality from which the *Maneless Lions* seen by him at Bagdad were obtained, and prove also their identity with those of Guzerat, a more extensive geographical range will be established for this curious race than Captain Smee is at present disposed to regard as probable.

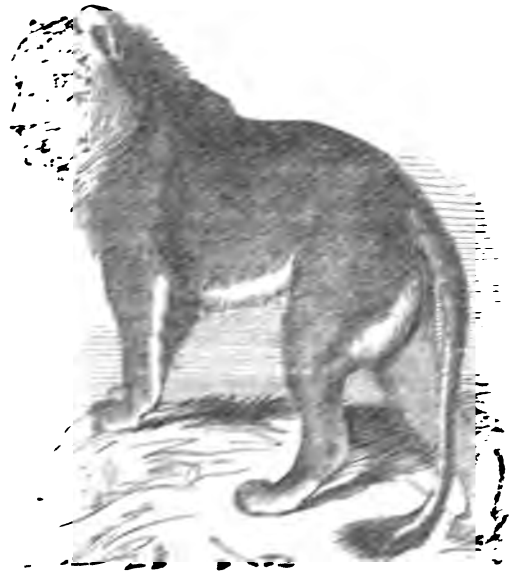
Captain Smee remarks that he is aware that the existence of these maneless Lions in Guzerat had been previously although by no means generally known, and quotes Lieut.-Col. Sykes as having this knowledge. Sir Charles Malet had also seen Lions on the banks of the Sumbermuttee, and though he makes no mention of the absence of the mane, Captain Smee thinks that they in all probability belonged to the maneless race, and indeed Sir Charles attributes to his Lion the native name noticed by Captain Smee above.

Our author makes the following remarks on the passages to be found in the antient writers bearing on this subject: 'Having alluded in the commencement of this communication to the opinion that a *maneless Lion* was known to the ancients, it might be expected that I should here bring forward and discuss the several passages which have been [illegible] as supporting this view. Where however the [illegible] are so [illegible] it would be presumptuous in me to attempt to decide. I own that I do not find in the passages [illegible] any evidence at all satisfactory as regards the [illegible] of Lions destitute of mane; and I am even [illegible] that the crisped hairs noticed by [illegible] as distinguishing one race of Lions from another, [illegible] the hairs were either dense or straight, must of [illegible] be considered as those of the mane rather than of any other part of the body. The language of Oppian is [illegible] and even the expressions used by him are [illegible] by the critics. Another Greek writer, [illegible] the peripatetic, speaks of the Arabian, and [illegible] Lions, in terms that recall [illegible] of Bagdad, but still with no de[illegible] to the want of a mane. Pliny alone, so far as I am aware, mentions the absence of mane as a distinctive mark of one race of Lions: but to this race he [illegible] generation, and he was probably [illegible] with respect to it.'

[illegible] remark that a maneless Lion is said to be [illegible] of Upper Egypt.

Captain Smee thus characterizes his Maneless Lion:—

[illegible], Linn., var. *Goojratensis*.—Mane of the male [illegible] tuft at the apex of the tail very large, black. (See *Zool. Proc.* [illegible]; and also *Zool. Trans.*, vol. i., where an excellent figure is given.)



Maneless Lion of Guzerat.

Habits of the Asiatic varieties generally. Claws, &c.—[illegible] of [illegible] give a [illegible] counters [illegible] stead of [illegible] will in time [illegible] of their enemies, [illegible] mouthed in the [illegible] they are [illegible] the heads of the largest [illegible] them to the ground [illegible]

Reproduction of the Lion, &c.—The Lioness is said [illegible] go with young five months, and produces generally [illegible] two to three or four,* at a litter, which are born [illegible]. Three, two males and a female, were whelped in the T[illegible] on the 20th October, 1827, the day of the battle of N[illegible]rino; but the number seems generally to be two. In [illegible]tivity the Lioness usually becomes very savage as soon [illegible] she becomes a mother; and in a state of nature both pare[illegible] guard their young with the greatest jealousy. Mr. Be[illegible] relates that in the commencement of the year 1823, Ge[illegible]ral Watson, then on service in Bengal, being out one m[illegible]ing on horseback armed with a double-barrelled rifle, [illegible] suddenly surprised by a large male Lion, which bou[illegible] out upon him from the thick jungle at the distance of [illegible] few yards. He instantly fired, and the shot taking com[illegible] effect, the animal fell dead almost at his feet. No soone[illegible] the Lion fallen than the Lioness rushed out, which [illegible] General also shot at, and wounded severely, so that she [illegible]tired into the thicket. Thinking that the den could [illegible] be far distant, he traced her to her retreat, and there [illegible]patched her, and in the den were found two beautiful c[illegible] a male and a female, apparently not more than three [illegible] old. These the General brought away; they were suck[illegible] by a goat, and sent to England, where they arrived in Se[illegible]tember, 1823, as a present to George IV., and were k[illegible] in the Tower. The male was the animal from which [illegible] Bennett gives his figure and description of the Bengal L[illegible] and the female was the mother of the cubs whelped in [illegible] Tower, above alluded to. (*Tower Menagerie.*) The young [illegible] at first obscurely striped, or brindled, and somewhat tiger-[illegible] in the coat. There is generally a blackish stripe exte[illegible] along the back, from which numerous other bands of the s[illegible] colour branch off, nearly parallel to each other on the sides [illegible] tail. The head and limbs are generally obscurely spot[illegible]. When young they mew like a cat; as they advance, [illegible] uniform colour is gradually assumed, and at the age of [illegible] or twelve months the mane begins to appear in the m[illegible] at the age of 18 months this appendage is consider[illegible] developed, and they begin to roar. (Bennett.) M. F. Cu[illegible] states that it is nearly the third year before the man[illegible] the tuft on the tail appear, and that they are not fu[illegible]veloped before the seventh or eighth year. It should [illegible]ever be borne in mind that the Bengal Lion mentioned [illegible] Mr. Bennett, and figured by him, was magnificently m[illegible] and he was little more than five years old. The per[illegible] shedding the milk-teeth is very often fatal to the [illegible] animals in a state of captivity. The natural period [illegible] Lion's life is generally supposed to be 20 or 22 years. [illegible] is Buffon's limitation, but the animal will, it seems, [illegible] much longer. Pompey, the great Lion which died in [illegible] was said to have been in the Tower above seventy [illegible] and one from the river Gambia is stated to have [illegible] there at the age of sixty-three.

The Lion, from its power and supposed generosity [illegible] position, has been popularly hailed as the king of [illegible] and considered as the emblem of majesty and might. [illegible] the symbol of the British nation, and is borne in the arms,* of which it forms one of the supporters, and [illegible] surmounts as the crest.

The generosity of disposition so liberally accorded [illegible] powerful beast has been much and eloquently praised [illegible] seems almost sacrilegious to dissipate the glow [illegible] which Buffon has raised; but if there is any dependence [illegible] be placed on the observations of those travellers [illegible] had the best opportunities of judging, and have the [illegible] character for veracity, we must be compelled to [illegible] that Buffon's lion is the lion of poetry and [illegible] and very unlike the cautious lurking savage that [illegible] a comparatively weak prey by surprise, overw[illegible] ed even by the terror, the might, and the violence of the attack, and is intent only on the gratification of its appetites. 'At the time,' says Mr. Burchell, 'when men first adopted the lion as the emblem of courage, it would seem that they regarded great size and strength as indicating it; but they were greatly mistaken in the character they had given of this indolent animal.' The fact of the Lion sparing the dog that was thrown to him, and making a friend of the little animal that was destined for his prey, has been much dwelt on; but these and other such acts of mercy, as they have been called, may be very easily accounted for. If not pressed by hunger, the Lion will seldom be at the trouble of killing prey; and the desire for a companion has created much stronger friendships between animals in confinement than that between a lion and a little dog.

---

* [illegible] Philostratus for the fact that Apollonius of Tyana [illegible] that was killed and carried eight young ones [illegible] of Apollonius a great many Lions however [illegible]. This testimony, however, is of little or no value [illegible] in allusion to the [illegible] mentioned [illegible] that the male [illegible] have been intended to represent [illegible] is still in use among the heralds [illegible] with reference only to the position of the [illegible] whether maned or maneless, is in the [illegible] face alone is seen, it is a lion. Hence with the [illegible] of the arms of the kings of England would be [illegible] maned. The Captain goes on to state that th[illegible] would indeed reduce them to leopards [illegible] regarded. The emperor Frederic [illegible] to our Henry III., was [illegible] in the royal shield of England, "in qua [illegible] by [illegible]." ('Zool. Trans.')

The Lion is easily tamed, and capable of attachment to man. The story of Androclus, frequently called Androcles, is too well known to need more than allusion, and we learn from Bell's 'Travels' that the monarch of Persia had on days of audience two great Lions chained on each side of the passage to the state room, led there by keepers in golden chains. Every wild beast show almost has its tame Lion, with which the keeper takes the greatest liberties; liberties which the beast will suffer, generally speaking, from none but him. All these exhibitions have however been entirely eclipsed by the feats of Mr. Van Amburgh, who exercises a complete control over the Lions and other great *Felidæ* which he has subjected to his will.

HYBRIDS.

The Lion and Tigress will, under certain circumstances, produce young. This has happened twice in England. Sir William Jardine gives the figures of one of a litter so bred, and exhibited in Atkins's collection, where they were whelped, in 1827; they had young. Sir William Jardine correctly describes the colour of the whelps as brighter than that of the Lion, and the bands as better marked than they generally are in the true-bred young lion. The specimen figured by Sir William is in the Edinburgh museum. Another litter from similar parents was whelped at Windsor; but these also died before they came to maturity. There does not seem to be much difficulty in promoting this union.

Lion Tiger Cubs.

PUMA, or AMERICAN LION.

The uniformity of colour in this great cat, combined with considerable ferocity, were probably the reasons which induced early travellers in America, who heard of it perhaps with circumstances of exaggeration, or caught hasty glimpses of it not unaccompanied with terror, to state that there were Lions in America. Thus, John de Laet (1633) says, that Lions are found in *Peru*, though they be few, and not so ferocious as they are in *Africa*, and that they are called in the native tongue *Puma*. In an old tract (1649), entitled 'A Perfect Description of Virginia,' we find among the 'Beasts great and small,' 'Lyons, Beares, Leopards, Elkes,' &c.; and Garcilasso tells us of the Puma, or Lion of Peru. In Hernandes (Rome, 1651) there is a long account of the animal under the name of '*Puma, seu Leo Americanus*;' and reasons are given to show that it is not a true lion.* In Piso the animal is noticed as the *Cuguacuarana*, and by Marcgrave as the *Cuguacuarana* of the Brazilians; hence the French name *Couguar*. Charlevoix describes it clearly enough under the name of *Carcajou* or *Quincajou*; this name Pennant thinks that Charlevoix gives by mistake. In D'Azara's *Gouazouara* of Paraguay we again trace the French name of this animal. Lawson and Catesby both describe it under the name of the *Panther*, by which designation it is known to the Anglo-Americans up to this day. It is the *Felis concolor* of Schreber and of zoologists generally, and though Linnæus is often quoted as the author of the name, it will not be found in his last edition of the *Systema Naturæ*. In Gmelin's edition it appears as *Felis discolor* (an error for *concolor*) with Schreber's description. It is the *Felis Puma* of Traill.

The reader will find in the 'Proceedings of the Zoological Society of London' (1833) a detailed account of the dissection of a Puma that had died at the Society's garden. The whole paper will well repay perusal, but our limits will only permit us to notice that point in which, it is allowed, one of the greatest differences obtains among the cats. This point is that part of the structure which is connected with the organs of voice, and, as Mr. Martin observes, some according modification must necessarily produce the deep-toned roar of the *Lion*, the snarl of the *Jaguar*, and the hissing cry of the *Puma*. 'The distance between the tongue and the *larynx* in the *Lion*,' says Mr. Martin, 'has been brought more than once under the notice of the Society; in the *Jaguar* this distance, comparatively speaking, is nearly as great; but in the *Puma*, an animal equal, or nearly so, in size to the *Jaguar*, the distance is reduced to an inconsiderable space, an inch or an inch and a half, according as the tongue is more or less protruded. In addition to this it is worthy of observation that the circumference of the *larynx* in the *Puma* is also very inconsiderable; compare, for example, the *larynx* of the *Jaguar* with that of the present animal, both natives of the wilds of the American continent. In the *Jaguar* we find a larynx indicating, from its general magnitude, considerable depth in the intonations of the voice; whereas in the *Puma*, if we take either its diameter, or its distance from the termination of the palate and base of the tongue, we are led to expect neither the roar of the *Lion* nor the growl of the *Jaguar*, but the shrill tones of an animal, ferocious indeed, but of all others of the genus perhaps the most stealthy and insidious.' Mr. Martin stated that he thought that he had observed a kind of mutual correspondence between the voice and the habits of animals, and expressed his intention of offering a few observations on that point on a future occasion.

Description.—Adult Male. No mane. Silvery fawn *above*, sometimes reddish, the tawny hairs of the upper parts whitish at the tips; nearly white *beneath*, and on the inside of the limbs, whitish on the throat, chin, and upper lip. Head black and gray irregularly mixed; ears on the outside, and particularly at their base, sides of the muzzle whence the whiskers spring, and end of the tail (which has no tuft) black. Length from nose to tail about *four* feet; tail rather more than two.

Female coloured like the male. Head small when compared with his.

Young.—Back marked with three chains of spots, which are generally of a blackish brown; dispersed spots or markings on the neck, shoulders, and sides. N.B. As the animal advances in age these markings become more and more obscure, till they are at last lost in the uniform colour.

A specimen of a young *Puma* exhibited at a meeting of the Zoological Society in 1831 was, like the young of the other species of *Felis*, variously spotted and striped, the depth of its markings approaching nearly to black, and being more intense than that observed in the Lion. The muzzle was nearly black, as was also the greater part of the tail. This young one had been recently brought forth at the Society's gardens, but died immediately; it was strongly contrasted with a specimen of the adult placed on the table for comparison.

Geographical Distribution.—North and South America. There is reason to think that it was formerly to be found from Canada to Patagonia, with an extensive range to the east and west, but its geographical area has been very much diminished, and is daily becoming more and more contracted before that civilization which is in our own time obliterating more species than one. Mr. Washington Irving ('Astoria') mentions it as being about the mouth of the Columbia River.

Habits, Chase, &c.—Lawson (*Carolina*) gives the following characteristic account of the Puma:—'The *Panther* is of the cat's kind; about the height of a very large greyhound, of a reddish colour, the same as a Lion. He climbs trees with the greatest agility imaginable, is very strong limbed, catching a piece of meat from any creature he strikes at. His tail is exceeding long, his eyes look very fierce and lively, are large, and of a greyish colour; his prey is swine's flesh, deer, or any thing he can take; no creature is so nice and clean as this in his food. When he has got his prey he fills his belly with the slaughter, and carefully lays up the remainder, covering it very neatly with leaves, which if any thing touches he never eats any more of it. He purrs as cats do; if taken young, is never to be reclaimed from his wild nature. He hollows like a man in the woods when killed, which is by making him take a tree, as the least cur will presently do; then the huntsmen shoot him; if they do not kill him outright he is a dangerous enemy when wounded, especially to the dogs that approach him. This beast is the greatest enemy to the planter of any vermin in Carolina. His flesh looks as well as any shamble's meat whatsoever; a great many people eat him as choice food, but I never tasted of a panther, so cannot commend the meat by my own experience. His skin is a warm covering for the Indians in winter, though not esteemed among the choice furs. This skin dressed makes fine women's shoes or men's gloves.'

---

* It is said to be the Misitli of Fernandez in the catalogue at the end of the volume. [illegible]

F 2

We may here observe, without throwing doubt on other parts of Lawson's description, which is, generally speaking, confirmed by others, that, like many other writers, he has been too hasty in speaking of the irreclaimable nature of his animal. We can testify to the amiable qualities of the late Mr. Edmund Kean's 'Tom.' The Puma, so called, which belonged to this extraordinary actor was perfectly tame, and followed him about like a dog. Nor is this the only instance of the docility of this species. Mr. Bennett observe that in captivity the Puma readily becomes tame, and that his manners closely resemble those of the domestic cat; 'like it,' continues Mr. Bennett, 'he is extremely fond of being noticed, raises his back and stretches his limbs beneath the hand that caresses him, and expresses his pleasure by the same quiet and complacent purring. They soon become attached to those with whom they are familiar; and numerous instances might be mentioned in which they have been suffered to roam almost at large about the house without any injurious results.' (*Tower Menagerie.*)

Charlevoix ('Journal,' vol. i.) gives a rather curious account of the Carcajou* going a hunting with three foxes; and of his lying in wait on a tree for the elk and leaping down upon him as he passes under.

It seems to be generally agreed that the Puma is a most destructive species; for when it meets with a herd of animals it will slay in all directions, sucking only a small portion of blood from each victim. To sheep, fifty of which, it is said, to have been known to kill in one night, it is most destructive, and the squatter well knows the ravages that it will make among his hogs. Though an expert climber, it is said to haunt in South America the marshy meadow lands bordering on the rivers rather than the forest. In the Pampas it must affect the comparatively open country; for there, as we shall presently see, it† is commonly taken by the lasso. In the northern districts the swamps and prairies are its principal haunts; and its prey, where flocks and herds are not, deer principally, upon which it is said to drop in the manner described by Charlevoix with regard to the elk.

The chace of this animal is conducted, in different parts of the American continent, according to the prevailing manners of the people who go forth to hunt it. Thus Captain Head relates that as soon as the dogs unkennel a Lion‡ or Tiger§ they pursue him until he stops to defend himself. If the dogs fly upon him, the Guacho jumps off his horse, and, whilst he is engaged with the dogs, knocks him on the head with the balls; but if the dogs bay and do not go boldly in, the Guacho throws his lasso over him, and gallops off, dragging him along the ground, while the hounds rush upon him and tear him. In the north, he generally falls by the rifle, after he is 'treed' by the hunting party. Audubon gives a most lively account of an expedition of this kind, headed by a squatter on the banks of the Coldwater River, which ended in the Puma's death. The 'cougar,' or 'panther,' as Audubon terms him, was driven 'to tree' twice, and each time received balls in that situation. Several go in company generally, for when the infuriated animal has had to deal with one hunter only the consequences have been sometimes fatal to the latter.

Cuvier remarks, that as it would appear that this anim extends, or did extend, from California to Patagonia, h has been careful in his researches to discover whether there were not many species, or at least varieties, in this gre extent of country; the conclusion at which he arrived wa that one species only existed.

The reader must bear in mind that there is another c of a uniform colour, *Felis unicolor*, Traill, which is said t inhabit the forests of Demerara and is one half less than t Puma. The *Black Couguar, Felis discolor*, is allowed b some zoologists and rejected by others.

Puma. (Felis concolor.)

Sir William Jardine describes as the Black Puma animal about 33½ inches long, without including the t which is about 13, and of which he gives a figure ta from a specimen brought in a merchant vessel to Green He gives as synonyms *El Negro* of D'Azara and *The* *Cat of America* (Griffith's 'Synopsis'), both with a n interrogation. Sir William adopts *Puma* as a genus, gives the following species:—*P. concolor; P. nigra;* *Eyra; P. Pajeros; and P. Pajeros chalybeata.*

FOSSIL LIONS.

Remains of the *Felis Spelæa* of Goldfuss, *Höhlenlöw* Lion of the caves, have been found in the caverns of F conia, &c. For an account of the four great fossil cats, as large as the Lion, enumerated by Professor Kaup the Epplesheim sand, see FELIDÆ, vol. x., p. 224, and detailed list of fossil cats see that article and TIGERS.

LIP. [HARE LIP.]

LI'PARI ISLANDS, the antient Æoliæ Insulæ, or L paræan Islands, are a group of small islands, situated tween Calabria and the northern coast of Sicily, and tween 38° 20′ and 38° 50′ N. lat. and 14° 10′ and 15° 1 long. They are mentioned by the antient geographers seven in number. Strongyle (now Stromboli), so c from its round form; Lipara, now Lipari; Hiera, or cania, now Vulcano; Didyme, now Saline; Phœni now Felicudi; Ericodes, now Alicudi; and lastly Euony which some think is the present uninhabited rock c Liscabianca, while others suppose it to be the inhab island of Panaria. There are several other smaller isl or rather rocks, such as Liscanera, Basiluzza, &c., belong to the same group, but are uninhabited and bar The principal islands are ranged as follows:—1, Strom the most northern and the nearest to Calabria, is a 40 miles west of the Gulf of Sant' Eufemia: it con of a conical mountain nearly 3000 feet high, which is a stantly burning volcano and has very frequent erupt It rises abruptly from the sea on all sides, except on north-east, where the declivity of the mountain is gradual, and allows of a cultivated space between it and sea, which produces cotton and some wine, and is inha by about 300 people. The island is about 12 miles in cuit. The flames of the crater are a constant light to sailors in that sea. 2. Panaria, about 10 miles south-west of Stromboli, is an extinct volcano, the crater of which slopes on one side to the sea-shore; the bottom or funnel of it is cultivated by a few individuals who are also fishermen. 3. Lipari, about five miles south-west of Panaria, the largest and most important island in the group, is a bishop's see, and the residence of a military governor; it is above 20 miles in circumference, and contains about 12,500 inhabitants. It has several mountains with volanic craters now extinct, though they emitted flames in the time of Strabo: it also contains mineral springs, and abundance of pumice stone, brimstone, lava, obsidian, and other volanic products. The land, which is very fertile, produces cotton, olives, and grapes, from which a luscious sweet muscat wine is made, called 'Malvasia di Lipari,' which, as well as dried raisins, forms an article of export. The inhabitants of Lipari are industrious. The town of Lipari, which has a harbour, is on the eastern coast of the island; it contains a castle, several churches, and some remains of antiquity. Lipari is said to have been colonized by Greeks from Cnidus; it was afterwards occupied by the Carthaginians, and became an important station for their fleets during their occupation of Sicily. During the first Punic war. it came into possession of the Romans. It was ravaged by Khair Eddin Barbarossa in the year 1544, who took the town and carried all the inhabitants into slavery. 4. Two miles south of Lipari is Vulcano, with a crater, not quite extinct, which emits smoke; the island is barren and deserted. Strabo mentions three volcanic vents which might be considered as so many different craters; and he adds that the largest ejected lava. 5. Four miles north-west of Lipari is the island of Saline, 16 miles in circumference, with several villages, and about 4000 inhabitants. It consists of two mountains separated by a deep valley which runs from north to south, and being seen in that direction at a distance from the sea, it has the appearance of being divided into two islands, which is the origin of its name Didyme, or double. The valley is extremely fertile in wine, fruit, pulse, &c. 6. Ten miles west of Saline is Felicudi, or Felicuri, about 10 miles in circumference, with a few hundred inhabitants; it produces corn, fruits, and wine. 7. About eight miles west of Felicudi is the small island Alicudi, the most western of the Lipari group; it is hilly and not very productive, has some pastures, and about 200 inhabitants. In these two last-mentioned islands there is no appearance of any volcano. The best description of the Lipari Islands is that by Dolomieu, *Voyage aux Isles de Lipari*, in 1783; see also Ortolani, *Dizionario Geografico della Sicilia*, 1819; Houel, *Voyage Pittoresque de Lipari, Sicile, et Malte*, fol., 1782; Neigebaur, *Gemälde Italiens;* Strabo, p. 275; Pliny, *Nat. Hist.*, iii., 9.

---

* Dr Richardson observes that Charlevoix applies the appellation of *Carcajou* to the Canada Lynx, the name of *Carcajou* being proper to the Wolverene, which mistake, the Doctor adds, has produced some confusion of synonyms among subsequent writers. Pennant refers to the passage given in the text, and says that Charlevoix by mistake calls the Puma *Carcajou*. See the articles GULO, LYNX.

† *P. Pajeros?* See post, opposite column.

‡ Puma.

§ Jaguar is often called the *Tigre*. See also Hernandez, where it is *Tigris Mexicana*.

The Islands of Lipari form part of the Intendenza, or administrative province, of Messina.

LIPPE, River. [RHINE.]

LIPPE. This principality probably derived its name from the river Lippe, on which the town of Lippe was built in the twelfth century. The ancestors of the family now reigning were reckoned in the twelfth and thirteenth centuries among the 'Primates Westphalorum,' and were the hereditary possessors of extensive countries. Bernhard von der Lippe obtained in 1127 the town of Lemgo from the emperor Lotharius; and he and his brother Hermann are mentioned for the first time with the title Von der Lippe in a document of the year 1129. Bernhard II., his son, a friend of Henry the Lion, appeared with a numerous retinue of well armed knights at the diet held at Mainz by the emperor Frederic I. In 1184 Bernhard III., obtained the lordship of Rheda by marriage in 1230. His grandson Simon I. inherited part of the county of Schwalenberg, and established in 1368 the *Pactum Pacis*, by which the eldest son only was to reign. Bernhard VIII., who died in 1563, was the first who took the title of Count von der Lippe. His son Simon VI. is the immediate founder of the present line. He divided his possessions among his three sons, of whom Simon VII., founded the line of Detmold, Otto (Otho) that of Brake, and Philip that of Bückeburg, or Schaumburg. The line of Brake becoming extinct in 1709, on the death of Louis Ferdinand, Count Adolphus of Lippe Detmold took possession of the country, without regarding the rights of Bückeburg, but the imperial Aulic council, by judgments passed in 1734 and 1737, assigned half of the country to Schaumburg Lippe, and the two houses concluded a convention in 1748.

LIPPE DETMOLD, consisting of the counties of Lippe and Sternberg, and part of that of Schwalenberg, forms a compact territory situated between 51° 45′ and 52° 10′ N. lat., and 8° 34′ and 9° 20′ E. long. It is bounded on the north-east by Schaumburg (more properly Schauenburg), belonging to Hesse Cassel; on the east by Calenberg (Hanover) and the county of Pyrmont; and on the north-east, south-east, south, and west by the Prussian province of Westphalia. The small bailiwick of Lipperode, with the town of Lippstadt (half only of which belongs to Lippe Detmold, and the other half to Prussia), lies detached, being entirely surrounded by Westphalia. The area of the principality is 435 square miles, and the population 80,000.

The country is mountainous but well wooded, and rich in the usual German products. The wooded chain Osning, commonly called by geographers the Teutobergerwald, commencing from the left bank of the Dimel near Stadtbergen in Westphalia, crosses the circle of Paderborn under the name of the Egge, and enters Lippe Detmold at Horn, whence it extends into the county of Ravensberg. The Osning, here called the Lippescher Wald (*i.e.* forest of Lippe), forms in the country three chains running parallel to each other from south-east to north-west, of which the first bounds the tract called the Senner Heath; the central one, which is the highest, contains the celebrated Externsteine, which are grotesque groups of sandstone rocks, where it is supposed that the antient German priests performed their ceremonies by moonlight; and the third is turned towards the valley of the Werra. The Osning divides the valleys of the Rhine and the Weser, the streams on the right running into the latter, and those on the left, for the most part, into the former river. The Weser, the only navigable river, just touches the northern frontier of the principality for a short distance, and receives the Emmer, the Exter, the Werra, the Bega, and some other small streams. The Ems rises at the foot of the Stapelagerberg, a branch of the Osning, crosses the Sennerheath, and soon enters the province of Westphalia. The Lippe merely touches the bailiwick of Lipperode and the town of Lippstadt. Vast forests of oak, beech, and other timber clothe the higher parts of the mountains, while on the slopes there is the finest arable land. The climate is temperate but not pleasant; the atmosphere is frequently loaded with fogs and vapours; the winter is cold and wet; the summer, especially in the Heath, very hot. The natural productions are corn, flax, hemp, potatoes, rapeseed, garden vegetables, and timber The inhabitants have the common domestic animals, small four-footed game, poultry, feathered game, fish, and bees. The mineral products are plaster of Paris, lime, clay, marble, and freestone; and there is a salt-spring from which 36,000 bushels of salt are annually obtained. The staple productions are flax and timber, of which large quantities are exported. The breed of horned cattle is good, and sufficient for home consumption; that of sheep has been very much increased and improved of late years. Swine and goats are numerous. The horses bred on the Senner Heath are hardy and spirited, and are esteemed some of the best saddle-horses in Germany. There are no manufactures of any importance. Thread, coarse yarn, and linen are made in some parts, chiefly by the peasantry after their labours in the field are concluded; there are likewise several tanneries and brandy distilleries, two glass-houses, five paper-mills, and many oil-mills and saw-mills. The exports, besides flax and timber, are some cattle, linen, and Meerschaum tobacco-pipes manufactured at Lemgo.

The religion of the prince and the great majority of the inhabitants is Calvinism; but the inhabitants of Lemgo and Lippstadt, and a small portion of those of Detmold, in all about 5400, are Lutherans, and there are in the principality about 1600 Roman Catholics. The government is monarchical, with an assembly of estates consisting of 21 members, which, according to the constitution of 1819, introduced by the Princess Pauline as regent during her son's minority, has much more extensive powers than any other representative assembly in Germany. The public revenue is 490,000 florins. The contingent to the army of the German confederation is 690 men, and to the common treasury 250 florins per annum. Lippe-Detmold, with Schaumburg-Lippe, Reuss, Hohenzollern, Liechtenstein, and Waldeck, has the sixteenth vote in the diet, and in the full council one vote of its own.

Detmold, the capital, situated on the Werra, consists of the old and new town, of which the latter is very pleasant, and has some delightful public walks and gardens. The [illegible] are the [illegible] the gymnasium, and the [illegible]. [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] and [illegible] [illegible] [illegible] and the [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible].

[illegible] Lippe [illegible] one of four [illegible] in the [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] Westphalia [illegible] [illegible] [illegible] and Germany and in German [illegible]. The [illegible] [illegible] feet deep. [illegible] [illegible] [illegible] [illegible] products are [illegible]. There are no manufactures, except [illegible] [illegible] [illegible]. The [illegible]. The [illegible] [illegible] [illegible]. The [illegible] [illegible] [illegible]. There are [illegible] [illegible] [illegible] [illegible] [illegible] in Prussia. LIPSIUS, JUSTUS, was born at Isque, a village between Brussels and Louvain, the [illegible] of October, 1547. He was educated at [illegible], Cologne, and Louvain, and at the age of [illegible] years he wrote *Variae Lectiones*, [illegible] of the [illegible] [illegible] this work was so highly esteemed [illegible] that he was received with distinction at Rome, whither he went in the same year [illegible] Cardinal Granvelle and Pope Pius V. After [illegible] two years at Rome he was appointed professor of history at Jena, where he taught till 1574. In 1579 he was [illegible] professor of history at Leyden, and took an [illegible] part in the [illegible] disputes of the times. [illegible] he professed the Reformed [illegible] quitting Leyden in 1591 he returned to the [illegible] Catholic [illegible], in which he had been brought up [illegible] two treatises in defence of the worship of [illegible] (*Diva Virgo Halensis*, [illegible]; *Diva Virgo* [illegible]). He was afterwards professor of history at Louvain, where he remained till his death, March 24, 1606.

The works of Lipsius, which are very numerous, were [illegible] at Antwerp in 1637; and also at [illegible] [illegible] the Latin authors, [illegible] Tacitus [illegible] [illegible] [illegible].

LIP[illegible] [illegible] *Hyrax*.

LI[illegible] [illegible].

LIQUATION, or ELIQUATION, a process by which [illegible] [illegible] and, when the latter [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] the silver [illegible] [illegible] and the silver [illegible] [illegible]. (Aikin's *Dictionary of Chemistry*, [illegible].)

LIQUIDAMBAR, a genus of plants of the natural family of [illegible], which has been [illegible] to [illegible] by Dr. Lindley. The name is derived from *liquidus*, fluid, and ambar, the Arabic name of amber. The genus [illegible] [illegible] [illegible]. The species are [illegible] [illegible] [illegible] and North America. *L.* [illegible] is the species found in Mexico and [illegible] United States, in the latter of which it is called sweet gum, and forms a large and fine tree, bearing some resemblance to the maple [illegible]. The wood is of a [illegible] texture and fine grain, and makes [illegible] furniture, but the tree is more noted for the fragrant liquid resin which exudes from incisions in the stem [illegible]. This is [illegible] liquidambar, and [illegible] balsam, which has a pleasant balsamic odour, and an aromatic [illegible] taste. This becoming dry and opaque, forms [illegible], which resembles very thick turpentine, has a [illegible] than [illegible] balsam, and [illegible] but more [illegible]. *L.* [illegible] is a small tree, a native of Cyprus and other parts of the East [illegible] was introduced [illegible] from Smyrna [illegible] the Red Sea. Dr. Pococke, as quoted by Dr. Lindley, states that it is called Xylon Effendi, the wood of our Lord, in Cyprus, where it produces an excellent white turpentine, especially by incisions made in the bark. It is this [illegible] substance perhaps which is [illegible] in many works [illegible] [illegible] as a balsamic fluid produced upon the island of Cobross, at the upper end of the Red Sea near Cadessa, which is three days' journey from Suez. But there are no recent accounts of this substance, which is thought by some authors to be procured from the following species.—*L. altingia* of Blume is a native of the forests of Java at elevations of [illegible] to [illegible] feet above the level of the sea. It forms a gigantic tree, with bark having a bitter and balsamic taste, yielding a fragrant balsam, or liquid storax, the [illegible] Malayan Archipelago [illegible] there is no proof that the liquid storax known in Europe is obtained from it, and it does not grow near the localities whence liquid storax has so long been obtained. It is therefore probable that some portion is obtained by boiling the branches of styrax officinale, or acting upon them with oil, spirit, or naphtha. [STYRAX.]

The subject is interesting as connected with antient commerce, inasmuch as old writers mention a liquid with the solid storax. By the Arabs the former is described under the name *miah-saileh*, liquid storax; and the latter, *miah-yabeseh*, solid storax. Both are described by Serapion under the head *Mihi*; by Avicenna under the several heads of *Lubnee*, *Astarak*, and *Mihi*. The name *miah-saileh*, with the affix *ras* [illegible], would appear to be the origin of the Malayan *Rasamala* and thus one which has been variously corrupted.

LIQUORICE. [GLYCYRRHIZA.]

LIRIODENDRON. [TULIP TREE.]

LIRIS. [CAMPANIA.]

LISBON (LISBOA, in Portuguese), the capital of the kingdom of Portugal, is situated on the northern bank of the Tagus, about nine miles above the bar or entrance of the river, in 38° 42′ N. lat. and 9° 5′ W. long. It rises in the form of an amphitheatre from the bank of the river, being built on a succession of hills, the highest of which are the hill of Buenos Ayres, or Estrella, to the west, and the castle-hill to the east. Most of the streets are steep, irregular, and tortuous, besides being ill paved and dirty. One part of the city however, which has been entirely rebuilt since the great earthquake of 1755, is regular and handsome; it lies on even ground in a valley which runs in a direction at right angles to the river, between the castle-hill to the east, and the hills of S. Francisco and D[illegible] Carmo on the west. This space contains about eight or nine well-built parallel streets, some of them, such as the Rua

Augusta, tolerably wide, and nearly half a mile in length, containing the best shops in Lisbon, especially those of the goldsmiths, silversmiths, and jewellers. These streets are crossed at right angles by other streets, and they terminate on the river side in a handsome square called Praça do Commercio, one side of which is formed by the Tagus, and the other sides by the arsenal, the custom-house, the exchange, royal library, and other public buildings. This square is adorned with a bronze statue of king Joseph I. At the opposite or north end of the above-mentioned streets are two squares, the Praça da Figueira, or market-place, and the Praça do Rocio, the latter of which is bounded on one side by the convent of S. Domingo and the massive building formerly occupied by the Inquisition. Farther north going towards the country is the Passeio Publico, or promenade, which however is small, and very inferior to the public gardens of other capitals.

The eastern part of the town, which lies at the foot of and beyond the castle, consists of narrow, irregular, ill-paved streets, with a good house here and there. This is the oldest part of Lisbon, and the houses are high and old-fashioned. It is remarkable that while the earthquake destroyed all the buildings in the valley, it spared the houses built on the steep declivity of the hill.

To the westward of the new streets the town rises on the steep declivity of a succession of hills, with a few good streets and open places here and there, especially along the river side, the rest of the streets being crooked, narrow, and filthy. Here and there are massive buildings, chiefly convents and churches, which crown the summits of the hills, and tower above all the rest. Lisbon being an open town like London, and its suburbs very long and straggling in various directions, it is not easy to define its limits. Its western boundary however is generally fixed at the stream of Alcantara, which falls into the Tagus, and from thence to the eastern extremity of the town the length in a straight line is between three and four miles, not reckoning the sinuosities of the ground; the depth of the town from the Tagus inland varies from one mile to a mile and a half, not including the long straggling lines of houses which extend along the approaches to the town. The whole of the area thus described is however far from being thickly covered with buildings; many parts are occupied by extensive gardens, plantations, the naked steep declivities of the hills, and by lanes and enclosures. The district of Buenos Ayres, along the slope of the western hill, is the least densely built, and contains many pleasant and healthy residences with gardens, which are mostly occupied by foreigners. West of the bridge of Alcantara a line of streets parallel to the Tagus connects Lisbon with the market-town and royal residence of Belem, or Bethlehem. [Belem.]

The Tagus from Belem up to the western end of Lisbon is little more than one mile in width, but opposite the centre of Lisbon it widens considerably, the left or southern bank turning suddenly to the south near the town of Almada, and forming a wide bay or reach about five or six miles in breadth, and extending far to the north-east. This bay gives to the river in front of Lisbon a sea-like appearance, which adds to the effect of the scenery. The southern bank, which is hilly about Almada, becomes low higher up the river, and is swampy at low water; it is however studded with small towns and villages, such as Aldea Gallega, Moita, Alhosvedos, Lavradio, Barreiro, Coina, Seixal, Casilhas, Montelo, and Almada. These places keep up a constant traffic with Lisbon, which they supply with fruits, vegetables, wine, &c., besides being the medium of intercourse between the capital and the southern provinces of the kingdom, and also with Spain by the post-road of Badajoz.

The broad Tagus gives to Lisbon a most splendid and safe harbour, which might contain all the fleets of Europe. The largest men of war can anchor close to Lisbon. The entrance of the river is defended by two forts, St. Julian on the north bank, and Bugio on a small island opposite, which is joined to the southern bank at low water.

The most striking and imposing buildings of Lisbon are its vast and massive convents, which crown the hills, and look like palaces and fortresses; before the late suppression of the monasteries they gave to Lisbon a monkish appearance. The wealth of these convents and the number of their inmates have been much exaggerated by party writers ever since the time of Pombal. Those who wish to hear the other side of the question, or a reasonable defence of the monks, will find it in a well written work published at Lisbon in the early part of the present century, by a graduate of the university of Coimbra, styled *Os Frades julgados no Tribunal da Razão*, ('The Friars brought to Judgment before the Court of Reason'), which gives the statistics of Portuguese monasteries. But the late suppression, like all those effected since the French revolution, has been executed in a hasty unfeeling manner, and instead of relieving the public distress has added to it, by throwing thousands of individuals destitute upon society. By forbidding the admittance of novices, by opening the doors of the convents to all those who wished to leave them, and by uniting the remaining inmates of several convents of the same order into one, the suppression would have been gradual, beneficial, and effectual, and no injustice would have been perpetrated; but this process appears too slow to those who wish to raise money by the summary process of confiscation, a process however which history has proved to be ruinous to states, although it may enrich unprincipled individuals.

The population of Lisbon is very mixed, consisting of people from every province of Portugal, who resort thither in quest of employment, of a great number of blacks and men of colour from the colonies, and of numerous Gallegos, or porters and water-carriers from Galicia, and other foreigners. The lower classes live poorly, and are dirty in their appearance. The crowds of beggars and vagrants, who display their sores and other infirmities, are troublesome, disgusting, and dangerous. The police is still very imperfect, and the streets are but partially and imperfectly lighted at night. Lisbon is not provided with conduits or sewers, and all the filth is thrown into the streets, from which it is washed off by the rain into the river. (Kinsey, *Portugal Illustrated*, 1828; Captain Alexander, *Sketches of Portugal*, 1844.)

The climate of Lisbon is healthy and genial; it is very hot and dry in the summer months, when the heat is often 93° of Fahrenheit, but is relieved by north-west winds; heavy rains fall in November and December; cold clear weather prevails in January, but in February the weather becomes mild again, and the spring begins. Snow is a very rare occurrence.

A fine aqueduct, Os Arcos das Aguas Livres, supplies Lisbon with good water, brought from several springs situated near the village of Bellas, three leagues north-west of Lisbon. The aqueduct is in part conducted under ground, but on approaching Lisbon it passes across a deep valley, and the water is carried over a number of bold arches for a length of about 2400 feet. The water enters the town on the north-west at a place called Amoreira, where is the reservoir, from which the water is distributed to the several fountains about the town. The Gallegos draw water in small barrels from the fountains, and sell it from house to house, or cry it about the streets.

Olive and orange trees, cypresses and judas-trees, and some elms and poplars, are the trees seen in the neighbourhood of Lisbon. Orange-trees abound both in the quintas, or gardens, and also in open spots; they require much water, which is distributed by small troughs or channels which are supplied by water-wheels. The earth is heaped up at the roots, and the water is conducted between these heaps. The fruit is perfectly ripe in May, and continues till August. Oranges for exportation are gathered in February, before they are ripe.

The greater part of the country round Lisbon, particularly on the east and north sides, is covered with large gardens surrounded by high walls, which bound the view on every side. These gardens, called 'Quintas,' are often of considerable extent, and laid out rather for use than pleasure, generally containing plantations of orange and olive trees, and sometimes vineyards and even corn-fields. A pretty large house is attached to them, in which the families of the owners spend part of the summer. To the west of Lisbon the country is not so well cultivated; the hills are more rocky and naked; the soil consists of basalt, covered here and there with limestone: the basalt on which Lisbon is built extends to the north-west towards the market-town of Bellas already mentioned, and thence to the north as far as the Cabeça de Montachique, and to the south as far as the Tagus near Belem. (Link, *Travels in Portugal*.) Beyond Bellas, running north-east to south-west and terminating on the sea at Cabo de Roca, rises a high range of mountains full of peaks, consisting of granite, partly covered with limestone. The south declivity of these mountains towards Lisbon is naked, and it is on the opposite or northern declivity that the delightful quintas and shady groves are situated which afford a summer residence to the wealthy inhabitants of Lisbon. [CINTRA.]

Leaving Lisbon for the north towards Torres Vedras there is a succession of suburbs or villages, such as Campo Grande, Carnide, Lumiar, Loures, &c., extending for several miles almost without interruption. The same occurs in a north-east direction along the banks of the Tagus towards Sacavem.

The population of Lisbon is reckoned at 260,000 inhabitants. Its trade, though much diminished since the loss of Brazil, is still considerable. It exports wine, fruits, and oil; and it imports corn, salt fish, salt butter, cheese, timber, iron, lead, tin, copper, coals, tar, and all sorts of foreign manufactures, with which it supplies the whole southern part of the kingdom. Lisbon has some manufactories of silks, paper, soap, and leather; its goldsmiths and jewellers are very expert; and there are also sugar refineries and potteries. We ought to observe here that the laziness and want of industry of the Portuguese have been much exaggerated by travellers.

The scientific and literary institutions are:—1. The Royal Academy of Sciences, founded during the reign of Queen Maria in the latter part of the last century. It is a most respectable association, and has published very interesting memoirs on the history, laws, and economy of Portugal, as well as upon its natural history and that of its colonies. 2. The College of the Nobles, a very handsome building, founded in 1761. 3. The Royal Academy of Marine, founded in 1779, or School of Navigation and Ship-building, with the observatory attached to it. 4. The Royal Academy of Artillery and Engineers, founded in 1790. 5. The Royal Military College. 6. The School of Music. 7. The Botanical Garden and Cabinet of Natural History at the royal residence of Ajuda, near Belem. 8. The Royal Library and that of the Necessidades. 9. The Royal Schools of Vicente de Fora, where philosophy, geometry, physics, and the antient languages are taught. 10. The Royal School of Drawing and Civil Architecture. There are also primary or elementary schools in the various districts of the city.

Society at Lisbon is rather dull: families live much among themselves; the Portuguese are not very fond of exercise, and their chief relaxation is going to their quintas in the summer. Carriages are scarce and old fashioned. The Italian Opera, or De Carlos, is a handsome house and much frequented. The Portuguese play-houses are small, and the performances not very choice. The best inns in Lisbon are kept by foreigners. There are some tolerable coffee houses, and a number of tavernas, or wine-shops, and eating-houses, generally dirty and ill-provided.

The inhabitants of Lisbon, though mostly inclined to bigotry, are very tolerant towards foreigners, owing to their constant intercourse with the English and other Protestants, and have not that horror of heretics which is exhibited by the inhabitants of the inland parts of Spain.

(Kinsey, *Portugal Illustrated*; Miñano, *Diccion. Geog.*; Link, *Travels in Portugal*, a good work of the end of the last century; and other tourists. See also *Map of Lisbon*, by the Society for the Diffusion of Useful Knowledge.)

LISBURN, a parliamentary borough town, not corporate, situated partly in the barony of Upper Massereene and county of Antrim, and partly in the barony of Upper Castlereagh and county of Down, in Ireland. The parish, called likewise Blaris, extends also into the barony of Lower Iveagh, in the county of Down. The town is 73 Irish or 93 statute miles from Dublin, and 7 Irish or 9 statute miles from Belfast. The boundaries of the borough, as settled by 2 and 3 Will. IV., c. 89, comprise 1325 statute acres.

This town took its origin from the erection of a fortified mansion, about 1610, by Lord Fulk Conway, to whom a large part of the territory of Killultagh had been granted by James I. These grants were enlarged and confirmed to Viscount Conway in the succeeding reign, during which the number of English and Welsh settlers in the town and neighbourhood greatly increased. The town was at this time called Lisnegarvey, and soon became a considerable place, as appears by the [illegible] successful defence which it made against the Irish under O'Neil on the 28th November, 1641. The town and castle were [illegible] in the hands of the Royalists [illegible], when Sir Charles Coote took possession of the place for the parliament. On the Restoration, King Charles II., in consideration of the loyalty and services of the inhabitants, granted them a patent, dated 27th October, 1662, by which the church of Lisburn was erected into a cathedral for the united diocese of Down and Connor, and the inhabitants of the borough were empowered to return two members to the Irish parliament. On the revocation of the Edict of Nantes, Lisburn became the residence of a number of French refugees, who introduced the linen and damask manufacture, from which much of the succeeding prosperity of the place has arisen. A fire which occurred in 1707 burned down the castle and the chief part of the town. The castle gardens were then turned into a public promenade, and the town rebuilt in a more substantial and handsome manner. During the prosperous period which intervened between the time of the Irish volunteers and the rebellion of 1798 Lisburn increased rapidly. Since that time the town has rather declined, owing probably to the superior facilities for carrying on the linen and cotton-spinning trades possessed by the neighbouring seaport of Belfast.

The seneschal of the manor of Killultagh is the returning officer in elections for the borough, which, since the Union, is represented in the imperial parliament by one member. The number of electors in March, 1836, was 134. The right of election by act 2 and 3 Will. IV., c. 88, is vested in the 5*l.* householders.

The appearance of Lisburn is very pleasing. It is situated on a gently rising ground, on the north-western or Antrim side of the Lagan. The market-house occupies an open space in the centre of the town, where the three principal streets meet. It is a handsome building, with a cupola. Near the market-house is the church, an elegant edifice with a lofty spire, on each side of which the two streets leading towards Belfast and the old bridge over the Lagan diverge. The castle gardens are included between the former of these and the river, over which the walks and terrace command a fine prospect. The houses in the main street are chiefly built of English brick, and have a very elegant appearance. Those in the opposite or western end of the town are of an inferior description, and the suburb towards Moira is mean. Of 992 houses within the borough, 675 are roofed with slate, which is an unusually large proportion of that class of houses in an Irish inland town. The manor court-house, formerly a chapel for the French Huguenots, and the linen-hall, are substantial and commodious buildings. There are also three Presbyterian meeting-houses, one Methodist ditto, and one Roman Catholic chapel.

Lisburn is well paved, and is amply supplied with water by conduits to the houses. The provisions of the Lighting Act have not been applied. The constabulary force quartered in the town discharge the duties of municipal police. On an island in the Lagan, in the eastern suburbs, are extensive vitriol-works. Some of the largest bleach-greens for linen in Ireland are in the vicinity; and in the town are print-works for muslins, and a diaper and damask factory, much celebrated for the beauty of its fabrics. A navigation extends from the town by the river Lagan to the sea at Belfast, and by the river and a canal to Lough Neagh. A railroad is now nearly completed between Belfast and Lisburn, which is intended as the commencement of a line through Armagh to Dublin. This is the second work of the kind hitherto undertaken in Ireland.

In 1812 the number of houses in the borough was about 800, and the estimated number of inhabitants 4812. In 1831 the number of houses was 992, and of inhabitants 5745. In 1824 there were in the parish of Lisburn 58 day-schools, educating 756 males and 548 females. Of these schools two were supported by the Association for Discountenancing Vice, and two others were partly supported by subscribers. The county infirmary is at Lisburn, and there are almshouses for fourteen females, supported by bequests, amounting in all to 2750*l.*

(*Survey of the County of Antrim*, Dublin, 1812: *Parliamentary Reports and Papers*, &c.)

LISCOV, CHRISTIAN LUDWIG, born at Wittenberg, 1701, although very little known in this country, yet ranks high in Germany for his satirical writings, which, by their caustic irony, show their author to have had a congenial turn of mind with Swift. Very few particulars of his life have been recorded, further than that about the year 1739 he was private tutor at Lübeck, where a person named Sievers was the first who fell under the castigation of his pen. After this he became private secretary to

Geheimenrath von Bünau, from which time nothing can be found respecting him till he entered the service of Von [illegible] at Dresden. Under this accomplished and generous patron he might have passed his days in tranquillity, had not his love of ridicule prevailed over his prudence. Having offended the English minister at that court by some sarcasms, he drew upon himself the resentment of the all-powerful Count Brühl, who caused him to be sent as a state prisoner to Eilenburg, where he died shortly after, October 30, 1760. Some however have questioned the truth of his having been in confinement.

Posterity has been more just to Liscow's merits than were his contemporaries. His satire was directed only against presumption and folly, and was besides far more general than personal, certainly impartial and without any respect to persons, for a powerful offender was in his eyes no more than the meanest. That he possessed no ordinary ability for politics may well be conceived when we find Pölitz, the editor of a posthumous work of his, saying that had Count Brühl listened to Liscow's advice, Germany would have been spared the Seven Years' War. The first complete edition of his works was published by Kriegsrath Müchler, in 3 vols. 8vo, Berlin, 1806. Of several of these pieces the titles will convey some notion of the subjects: 'On the Excellence and Usefulness of Bad Writers;' 'On the Uselessness of Good Works towards Salvation;' and the 'Inaugural Discourse of the learned J. E. P., &c. at the Academy of Small Wits; together with the Reply of that eminent Society.' Liscow's own Apology for his satirical attacks is most admirable; and it may be remarked, that although satire seldom reforms those who are the immediate objects, it is nevertheless highly beneficial with respect to many who would else commit the same follies.

LISIEUX, a town in France, capital of an arrondissement in the department of Calvados, 93 miles west by north of Paris in a straight line, or 106 miles by the road through Evreux. This town existed at the time of the Roman Conquest, when it was called Noviomagus, or Neomagus: it subsequently took the name of Lexovii, from the people to whom it belonged; and from this name the modern Lisieux is derived. It was pillaged by the Normans in A.D. 877; burned by the Bretons in A.D. 1130; and taken and retaken several times in the wars of the English in France, and in the religious dissensions of the sixteenth century. It was before the Revolution the seat of a bishopric; the bishop was a suffragan of the archbishop of Rouen.

The town stands on the right or east bank of the Toucques at the junction of the Orbec. The old walls have been lately replaced by some tolerably handsome buildings and a promenade. The streets of the town are tolerably wide; the houses are mostly of wood. The chief public buildings are the ex-cathedral, an antient edifice; the episcopal palace with its gardens, the seminary for the priesthood, and the great hospital. The population in 1831 was 10,257; in 1836 it was 11,473, showing an increase in five years of 1216, or above 10 per cent. The manufactures of the place are chiefly of broad-cloth, flannel, and other woollen fabrics; woollen and cotton yarn, and cotton goods; horse-cloths of wool and hair; leather, and brandy. There are bleaching and dyeing establishments. The trade, which is chiefly in the manufactures of the town, is promoted by the navigation of the Toucques, which commences at Lisieux. There are six yearly fairs. Besides the public institutions already noticed, there are several others, judicial or fiscal; also a high school and a theatre.

The arrondissement of Lisieux comprehends 345 square miles, and had in 1831 a population of 68,716, in 1836 of 69,514. It is subdivided into six cantons and 131 communes.

Among the former bishops of Lisieux, Jean Hennuyer deserves honourable mention: at the time of the massacre of St. Bartholomew he preserved the Protestants of his diocese. His kindness won over many of them to the Catholic faith.

LISKEARD, LESKEARD, or LESKERET, a parish, corporate town, and parliamentary borough, in the hundred of West and county of Cornwall, distant 219 miles west-south-west from London. The assessionable Duchy Manor of Liskeard includes the whole parish and borough. The charters of the borough are numerous, commencing with that of Richard, king of the Romans and earl of Cornwall, brother of Henry III., granted in the year 1240; the latest is of the 29th Elizabeth, and dated 28th July, 1587. The council consists of 4 aldermen, one of whom is the mayor, and 12 councillors. The revenue of the corporation for the year ending October, 1842, was 442*l*., and its expenditure during the same period was 242*l*.; but in previous years the expenditure had considerably exceeded the revenue.

The town, which is meanly built, stands partly in a hollow and partly upon rocky heights, which give to the streets an appearance of great irregularity. Of late years the town has been much improved, and several persons, possessed of large properties, have decorated the immediate environs with excellent houses. The chief public building is the town-hall, erected about the beginning of the last century, at the expense of one of the members for the borough; it is a handsome structure, supported on granite columns. Liskeard still continues a place of considerable trade, and has an excellent market. It has been greatly benefited by the recent improvement of the roads in that part of Cornwall. The living is a vicarage, in the diocese of Exeter, possessing an average net income of 304*l*., the rectory having been appropriated to the priory of Launceston. In 1264 the bishop of Exeter excommunicated the inhabitants of Liskeard, and put their church under an interdict, for refusing to pay tithes in kind on the ground of a composition between Earl Richard and the prior. (1 *Par. Roll*, 312.) An attempt was afterwards made to appropriate the vicarage also. (2 *P. R.* 593.) The population of the borough in 1831 was 2853 and that of the entire parish 4049; the parochial assessments for the year ending 25th March, 1829, amounted to 673*l*. Before the passing of the Reform Act, the corporation of Liskeard had returned two members in parliament continuously from the reign of Edward I. The borough, which consists of the parish of Liskeard and such parts of the old borough of Liskeard as are without the parish, now returns one member. For the history of Liskeard, as part of the duchy of Cornwall, see Manning's *Exchequer Practice*, 2nd ed., 374, 380; 1, 2, 3, and 4 Mann. & Ryl. *Rep.*, 141-2, 153, 177, 471-7; 2 Ventris' *Rep.*, 348. LISLE, or L'ISLE. [VAUCLUSE.]

LISLE, WILLIAM DE, born at Paris 28th February, 1675, was the eldest son of Claude Delisle, a geographer and historian, under whose instruction he gave early proofs of a decided predilection for geographical pursuits.

Before the time of Delisle, the principal maps of authority were those of Nicholas Sanson, to whom geography is under many obligations; but these maps were exceedingly erroneous from the want of astronomical observations, although it does not appear that the author had fully availed himself of the few observations which really existed. After the death of Sanson, his sons continued to reproduce his maps with little or no alteration, notwithstanding that the more recent accounts of travellers and the observations of astronomers were greatly at variance with many of their positions. For this they were repeatedly censured both by La Hire and Dominic Cassini, to which however they seem to have paid little regard. At length, in 1696, Cassini drew a planisphere upon the pavement of the hall of the Paris Observatory, whereon he marked the position of 40 places according to their observed latitude and longitude, and thus exhibited the magnitude of the errors which vitiated the existing maps, and at the same time pointed out the means of effecting their improvement. Still however the geographical positions of by far the greater number of places could only be inferred from antient itineraries, and from the varied and often conflicting accounts of modern travellers, while the coast-lines had for the most part to be determined from a tedious comparison of the log-books of seamen. It is obvious that for a task of this description, in addition to the requisite scientific knowledge, which is comparatively of easy attainment, a person should be familiar with languages, and his reading must be sufficiently extensive to enable him to avail himself of all historical resources; he must be able to appreciate the changes which have taken place either through accident or fraud, in the measures of different nations, a problem of very considerable difficulty; but above all he must exercise a highly critical judgment in according to each statement a degree of confidence duly proportioned to its merits. With many of these qualifications Delisle was eminently endowed, and although he left ample room for the display of perhaps greater abilities in his successor M. d'Anville, there is no doubt that his own labours contributed powerfully to the improvement and extension of geographical knowledge. Four years after Cassini had exposed the enormous inaccuracies of the then existing maps, Delisle published (1670) four maps of Europe, Asia, Africa, and America, together with two globes about one foot in diameter, the one of the terrestrial, the other of the celestial sphere. In these the extent of several countries was so materially altered as to give to the earth an appearance altogether new. The length of the Mediterranean from the Straits of Gibraltar to the coast of Syria, instead of being 1160 leagues (3225 miles), was now limited to 860 leagues (2391 miles), or to less than three-fourths of its former length; the difference of longitude between the eastern and western boundaries of Asia was in like manner lessened by 25 degrees: and many other important corrections, which it is not necessary to enumerate, were introduced for the first time in these maps.

The reputation and profit which Delisle derived from these publications excited the cupidity of a man named Nolin, who, though distinguished by the title of geographer royal, did not hesitate to publish pirated copies of Delisle's maps, in which he purposely introduced a few slight errors, in the hope of thereby evading detection; and when taxed with the fraud, he retorted by ascribing the plagiarism wholly to Delisle. The latter was in consequence obliged to institute legal proceedings, less with a view to protect his interest than to clear his character of an unjust imputation. The result of the prosecution, protracted during six years, was in favour of Delisle, authorising him to seize and destroy the maps and plates of the defendant, a permission of which he partially availed himself.

In 1702 he was elected a member of the Royal Academy, and shortly afterwards was appointed geographical tutor to Louis XV., who conferred upon him the title of chief (premier) geographer royal, a title which did not previously exist, and which has since been conferred only upon M. d'Anville.

The maps of Delisle, in illustration of particular countries and of particular periods of history, now succeeded each other in rapid succession. Among them, the edition of his planisphere, published in 1724, is deserving of particular mention, as it shows the progress which had been made in geography before D'Anville had contributed considerably to its improvement. The latest edition of his maps, we believe, is that of 1789, published by Dezauche, in 2 vols. fol., and comprising 158 sheets. Besides these he has left an atlas of antient geography and an atlas of France divided into provinces. Such was his fame that most authors of respectability who wrote upon history or subjects connected with it, were desirous of having their works illustrated by his maps. The czar of Russia, the king of Sicily, and other European sovereigns are said to have made munificent offers in the expectation of inducing him to enter their service and to reside permanently in their dominions, but his attachment to his own country would not permit him to accept them. Peter the Great in particular was in the habit of paying him frequent visits during his sojourn at Paris, partly to give and partly to derive information respecting his own territories.

Delisle died at Paris, 25th of January, 1726. In the Transactions of the Royal Academy are printed the following memoirs bearing his name:—

‘Observations on the Variation of the Needle with reference to Halley's Map,’ 1710; ‘Justification of the Antients in matters of Geography,’ 1714; ‘On the Longitude of the Straits of Magellan,’ 1716; ‘Geographical Determination of the Situation and Extent of the different parts of the Earth,’ 1720; ‘Geographical Determination of the Situation and Extent of the Countries traversed by Cyrus in his Expedition against his brother Artaxerxes, and of those traversed by the ten thousand Greeks in their retreat,’ 1721; ‘Remarks upon the Map of the [illegible] Sea, sent to the Academy by [illegible],’ 1721; ‘Comparison of the extent of L[illegible] and Paris and some other cities both [illegible],’ 1725; ‘On the L[illegible] of the mouth of the [illegible],’ 172[illegible]. Besides the foregoing [illegible] ‘An Introduction to Geography,’ [illegible] [illegible] [illegible] by [illegible]

([illegible]
graphie Universelle [illegible])

LISMORE, a bishop's see, late in the archiepiscopal province of Cashel, and now in that of Dublin, in Ireland. It includes portions of the counties of Waterford and Tipperary, and extends 37 statute miles by 38. The chapter consists of a dean, precentor, chancellor, treasurer, archdeacon, and 8 prebendaries. In 1792 the diocese was divided into 73 parishes, constituting 35 benefices, and having 22 churches. In 1834 the numbers were: parishes, 7[illegible]; benefices, 43; churches of the Establishment, 36; other places of Protestant worship in connection with the Establishment, 1; and Roman Catholic churches, 65. In the latter year the total population of the diocese was 216,2[illegible], of whom there were 5970 members of the Established Church, 164 Presbyterians, 382 other Protestant Dissenters, and 209,720 Roman Catholics; being in the proportion of about 32 Roman Catholics to 1 Protestant. In the same year there were, in this diocese, 236 daily schools, educating 17,609 young persons, being in the proportion of 8·14 per cent. of the entire population under daily instruction; in which respect Lismore stands thirteenth among the dioceses of Ireland. Of the above schools, 12 were, in 1[illegible], in connection with the National Board of Education.

St. Carthag, commonly called Mochuda, of Ratheny, Westmeath, where he had a famous school, was the founder of the cathedral and school of Lismore, in A.D. 631. Cataldus, afterwards bishop of Tarentum in Italy, succeeded. During his time and that of his predecessor, the school of Lismore was greatly celebrated for the number of its students; and the town or city is said to have been almost exclusively inhabited by ecclesiastics. Soon after the arrival of the English, the antient see of Ardmore was annexed to the diocese; and in the bishopric of Thomas de Re[illegible], who succeeded A.D. 1358, the see, so increased, was added to that of Waterford. By the 3 and 4 Wm. IV., c. 39, the see of Waterford and Lismore, being void, has been annexed to the united see of Cashel and Emly, and its temporalities are now vested in the Ecclesiastical Commissioners.

The town of Lismore is situated in the barony of Coshmore and Coshbride, and county of Waterford, on the southern bank of the Blackwater, three miles from the point where that river changes its course from east to south, near Cappoquin. The Blackwater, opposite Lismore, is joined by the Owenshad, a rapid stream descending from the Knockmeledown mountains, which form a prominent object in the surrounding country. A handsome bridge, the centre arch of which has a span of 100 feet, crosses the main river a little above the point of junction, and leads to the town, which occupies the summit of the southern bank. At the eastern extremity of the town is the cathedral, a plain handsome building, with a tower and spire, boldly situated on the crest of the hill. It is in the later English style, and was chiefly built by the Earl of Cork in 1663. The castle, a magnificent pile, originally erected by King John in 1185, and greatly enlarged and strengthened by the Earl of Cork, stands on the summit of a rocky bank, which rises to the height of nearly 100 feet above the Blackwater, at the opposite or western end of the town. Lismore is the property of the Duke of Devonshire, by whom it has been greatly improved of late. The town is also much indebted to the late duke, who built the bridge at a cost of [illegible], and restored the castle, which had been reduced almost to ruin during the civil wars of the seventeenth century.

Lismore was erected into a borough by charter of James I., and was represented in the Irish parliament by two members. The franchise was abolished at the time of the Union, and the compensation, amounting to 15,000l., was paid to the trustees of the late Earl of Cork and Burlington. By the same charter, granted in 1613, the borough was incorporated; but the corporation is now defunct. The water is naturally navigable to within a mile of the town, and a canal has been constructed by the late Duke of Devonshire, by which lighters can now come up as far as the bridge. There is a small export of grain and flour; imports are trifling, consisting chiefly of coal and [illegible] brought by lighters from Youghall.

In 1831 there were in the town 366 houses [illegible] inhabitants. In 1834 there were in the parish of L[illegible] [illegible] schools, educating 705 males and 4[illegible] females; [illegible] two were chiefly supported by the [illegible], one by an annual grant from the Duke [illegible] [illegible] by an endowment by Lord Cork, and [illegible] from Sir Richard Musgrave

(Smith's *History of the County of Waterford*; Ware's *Bishops*; Beaufort's *Memoir of a Map of Ireland*; *Parliamentary Reports*, &c.)

LISSA, or *Polish Lissa* (in Polish, *Leszno*), a handsome town in the Prussian province of Posen, in 51° 52′ N. lat. and 16° 36′ E. long., belongs to Prince Sulkovsky, who has a palace there. It has two Calvinist, one Lutheran, and one Roman Catholic church, a large synagogue, a Calvinist Gymnasium Illustre, a Lutheran and a Roman Catholic school, and two hospitals and a theatre. Lissa is one of the most important manufacturing towns in the province. The principal manufactures are woollen cloths, linen, leather, hats, carriages, tobacco. The inhabitants, 8667 in number, of whom 3470 are Jews, carry on a very active trade.

LISSA, a village in Prussian Silesia and the government of Breslau, is celebrated on account of the victory gained in the vicinity, on the 5th of December, 1757, by Frederic II., at the head of 36,000 men, over an army of 70,000 Austrians and Imperialists, of whom 21,500 were made prisoners on the field of battle, 17,000 were taken in Breslau, which was forced to surrender after a short siege, and 15,000 were captured on the retreat of the remains of the army into the mountains. This battle is likewise called the battle of Breslau.

LISSA. [Dalmatia.]

LIST, CIVIL. [Civil List.]

LISTING. [Enlistment.]

LITANY, a collection of prayers and supplications. The term is derived from the Greek λιτανεία, and was adopted by Christian writers at a very early period. St. Basil tells us that Litanies were read in the church of Neocaesarea between Gregory Thaumaturgus's time and his own; and St. Ambrose has left a form of Litany which bears his name, agreeing in many things with that in use in the Church of England.

In the Common Prayer Book of 1549 (the first book of King Edward), the Litany was placed between the Communion Office and the Office for Baptism, under the title of 'The Litany and Suffrages;' which book also directed it to be said or sung on Wednesdays and Fridays. In the review of the Common Prayer in 1552, the Litany was placed where it now stands, with the direction that it shall be used on Sundays, Wednesdays, and Fridays, and at other times when it shall be commanded by the ordinary. Till the last review, in 1661, the Litany was used as a distinct service, and followed the Morning Prayer; it was then directed and has ever since continued to be read as one office with the Morning Prayer, after the third Collect for Grace.

(Wheatley's *Rational Illustr. of the Book of Common Prayer of the Church of England*, 8vo., Oxford, 1810, pp. 163, 164.)

LI-TCHI, or **LEECHEE**, a fruit commonly sold in the markets of China, and occasionally brought to England, is the produce of the Euphoria Litchi of botanists, a tree belonging to the natural order Sapindaceae. The eatable part is a pulpy flesh, which covers a stone enclosed in a hard, dry, tessellated, prickly pericarp. Another fruit, called the Lung-yen or Longan, is yielded by another species of the same genus. The Chinese cultivate many varieties of each.

LITHARGE. [Lead.]

LITHIC ACID. [Uric Acid.]

LITHIUM, a metal, the oxide of which was discovered by Arfwedson in 1817, and called *lithia* (from λίθος, a stone), from its occurring only in the mineral kingdom. It was first found in petalite and spodumene, minerals which occur in the iron-mine of Uto in Sweden, and it has since been discovered in amblygonite and lepidolite. These substances contain from about five to nearly ten per cent. of lithia in combination with silica, from which it is best separated by the following process of Berzelius: One part of petalite, or other mineral containing lithia, is to be mixed with two parts of fluor spar, both substances being finely powdered; the mixture is to be heated with three or four times its weight of sulphuric acid, as long as vapours are disengaged; the silica is expelled with the fluorine, and the alumina and lithia remain in combination with sulphuric acid; these salts are to be dissolved in water, ammonia is added to precipitate the alumina; the filtered solution is to be evaporated, and heated to redness, to expel the sulphate of ammonia, and sulphate of lithia remains, which, being treated with barytes, water is decomposed, sulphate of barytes is formed and separated, and pure lithia remains in solution, which, being evaporated, hydrate of lithia is left. Lithium is but little known. Davy obtained it from the above described hydrate by means of voltaic electricity, in the same way as he had previously procured potassium and sodium from their respective hydrates. Lithium was found to resemble sodium in its whiteness, but it was oxidized and reconverted to lithia with such rapidity, that its properties could not be minutely examined.

Oxygen and Lithium, it is evident from what has just been stated, combine with great readiness, and are separable with difficulty. Only one compound of these bodies is known, and that is the alkaline oxide *lithia*, which exists, as has been mentioned, in certain minerals, and also in the waters of Carlsbad, but in combination. Lithia, in its alkaline properties, in forming a hydrate with water, and in its chemical relations, is closely allied to potash and soda; and, unlike those alkalis, is not very soluble in water, but the solution resembles theirs in being caustic. It has not yet been obtained in the anhydrous state, so that when the solution is evaporated, hydrate of lithia is procured, which fuses at a low red heat, and on cooling concretes into a mass, which has a crystalline fracture; it does not attract moisture from the air.

The hydrate of lithia has not been analysed, but from indirect experiments the oxide is concluded to consist of—

One equivalent of oxygen . .	8
One equivalent of lithium . .	6
Equivalent	14

Chlorine and Lithium readily combine when the alkali is dissolved in hydrochloric acid; the solution, when evaporated to dryness and fused out of the contact of air, leaves chloride of lithium, which is a white semitransparent substance, very deliquescent, and soluble both in water and in alcohol. By evaporation cubic crystals are obtained, the alcoholic solution of which burns with a peculiar red flame. When strongly heated in the air chlorine is expelled and oxygen absorbed, and the alkali lithia remains. It is probably composed of—

One equivalent of chlorine . . .	36
One equivalent of lithium . . .	6
Equivalent	42

Sulphur and Lithium, when obtained in combination by decomposing the sulphate of lithia with excess of charcoal, form an extremely pyrophoric substance.

Iodine and Lithium.—No compound of these is yet known.

Fluorine and Lithium form a fusible compound, prepared by dissolving lithia in hydrofluoric acid; it is difficultly soluble in water; the solution deposits small opaque crystals.

Acids and Lithia combine to form salts:—

Nitrate of Lithia is obtained by adding lithia to the acid. This salt is very deliquescent; when the solution is gently evaporated, crystals are obtained, which are sometimes needleform and sometimes regular rhombic prisms. Its taste is like that of nitre; it is extremely fusible, and becomes by heat as liquid as water. It is probably composed of—

One equivalent of nitric acid . .	54
One equivalent of lithia	14
Equivalent	68

Carbonate of Lithia.—When a strong solution of carbonate of ammonia is added to one of sulphate of lithia, a white precipitate of carbonate of lithia is formed. This salt is very slightly soluble in cold water; it is alkaline to test-papers, is decomposed by acids with effervescence, and has an alkaline taste. It is decomposed by lime and barytes, which separate the carbonic acid. It consists of—

One equivalent of carbonic acid .	22
One equivalent of lithia . . .	14
Equivalent	36

The waters of Carlsbad in Bohemia are stated to contain bi-carbonate of lithia in solution; and by spontaneous evaporation the carbonate separates in the state of a crystalline crust.

Sulphate of Lithia.—This salt is very soluble in water; it has a saline taste without bitterness, and crystallizes only in irregular masses. The air does not act upon it, and, unlike most of the salts of lithia, it is very difficult of fusion. It is composed of—

One equivalent of sulphuric acid . .	40
One equivalent of lithia	14
Equivalent	54

Phosphate of Lithia may be obtained by adding phosphoric acid to sulphate of lithia; no precipitate is at first formed but on adding excess of ammonia an insoluble phosphate of lithia is thrown down: this property enables us to separate lithia from potash and soda.

Characters of Lithia and its Salts.—Lithia acts so readily upon platinum, that, according to Berzelius, this property will serve to detect a small quantity in any substance: for when it is heated with soda on platinum foil, the soda displaces the lithia, and the platinum round the fused mass assumes a colour more or less deep according to the quantity of lithia set free. Lithia is distinguished from soda and potash by its greater saturating power, as shown by its lower equivalent number; chloride of lithium is distinguishable from the chlorides of sodium and potassium by its solubility in alcohol, and the solution burns with a red flame. Its salts are not precipitated by chloride of platinum, as those of potash are; and, unlike both potash and soda, it forms a difficultly soluble carbonate and phosphate.

LITHODENDRON, a generic name of some Zoophyta, proposed by Goldfuss to include Caryophyllia and Oculina of Lamarck, and adopted by many geological writers in a rather vague sense. Blainville rejects the term. ('Actinologie,' p. 347.) The species ranked by Dr. Goldfuss in the group of Lithodendra offer many diversities of structure, and lie in strata of various antiquity ('Petrefacta Europæ'), especially in the transition and carboniferous limestones.

LITHODOMUS. [MYTILIDÆ.]

LITHOGRAPHY, the art by which impressions or prints are obtained by a chemical process from designs made with a greasy material upon stone. It has therefore been properly termed chemical printing, to distinguish it from all other modes of obtaining impressions, which are mechanical. In printing from an engraving on a copper or steel plate, the ink is delivered from the incisions made therein with the graver or etching-needle. An engraving on wood, on the contrary, gives its results from the projecting surface of the block, or those parts which are not cut away by the graver. The lithographic process differs from both these modes, the impressions being obtained (by strict attention to chemical affinity) from a level surface.

There are various styles of lithography, as will presently be seen; but the principle of the art is uniformly the same, being, as we have said, based upon those of chemical affinity.

The stone best calculated for lithographic purposes is a sort of calcareous slate, found in large quantities on the banks of the Danube in Bavaria. Stones much resembling the German have been found in some parts of Devonshire and Somersetshire, and also in Ireland; but we believe that on all the trials hitherto made, the stones found in this kingdom have been proved to want some of the most essential qualities of those brought from Germany, which are therefore almost exclusively used. Even these vary much in quality, all the strata not being equally good: some are too soft, and others are rendered unfit for use by the presence of chalk, flaws and veins, and fossil remains. A good stone is porous yet brittle, of a pale yellowish-drab, and sometimes of a grey neutral tint. The stones split into slabs varying from 1½ to 2½ inches in thickness, which are then cut or squared into the different sizes necessary for use, and the face or upper surface of each is made level. In this state the stones are sent from the quarry; but further preparation is yet necessary to fit them for the immediate use of the artist, and they are either grained or polished, according to the nature of the work they are intended to receive. The mode of preparing a grained stone, as it is called, is this:—A stone, being laid flat on a table, has its surface wetted, and some sand sifted over it through a very fine wire sieve. Another stone is laid with its face downwards upon this, and the two are rubbed together with a circular motion, to produce the requisite granulation, which is made finer or coarser, to suit the taste or intention of the artist. The stones thus prepared are used for drawings in the chalk manner, or for imitations of those produced with the black lead pencil. Great care is requisite in this mode of preparation, to keep the granulation uniform and the surface free from scratches, the presence of which would otherwise much disfigure the future work.

Writings, imitations of etchings, pen and ink sketches, &c. require the face of the stone to be polished, which is effected by rubbing it with pumice-stone and water, or pumice-stone dust and water, applied with rags: no sand is used, as it would produce a grain.

The two principal agents used for making designs, writings, &c., on stone, are called lithographic chalk and lithographic ink. They are composed of tallow, virgin-wax, soap, shell-lac, and enough lampblack to impart a colour to the mass. These are incorporated by a peculiar process of burning in a closely-covered saucepan over a fire, and the whole is ultimately cast into a mould, and receives the form calculated to fit it for use. The ingredients are the same in the chalk and the ink, but the proportions are varied. The chalk is used as it comes from the mould in a dry state, but the ink is dissolved by rubbing, like Indian ink, in water, and is used in a pen or camel-hair pencil. It will be perceived that it is the presence of the soap in this greasy material which renders it soluble in water.

To render the lithographic process intelligible, let it be supposed that the artist now completes a drawing with the chemical chalk just described, upon a grained stone. If while in this state, a sponge filled with water were passed over the face of the stone, the drawing would wash out, the chalk with which it is made being, as we have seen, soluble in water, by reason of the soap which it contains. Before therefore it is capable of yielding impressions, a weak solution of nitrous acid is poured over it, which unites with and neutralizes the alkali or soap contained in the chalk, and renders it insoluble in water. After this the usual course is to float a solution of gum over the whole face of the stone, and when this is removed, if a sponge and water be applied to its surface, as before supposed, the drawing is found to be no longer removable, because the chalk with which it is executed is now no longer soluble in water. In this state the work is ready for the printer, who obtains impressions by the following process.

Having thrown with the ends of his fingers a few drops of water on the stone, and spread them with a sponge, so as to wet, or rather damp, the whole surface equally, the printer finds that the water has been imbibed by the stone only on those parts not occupied by the drawing, which being greasy repels the water and remains dry. A roller properly covered with printing-ink is now passed over the whole stone, which will not even be soiled where it is wet, from the antipathy of oil and water. But the parts occupied by the drawing being, as we have seen, dry and greasy, have an affinity for the printing-ink, which therefore passes from the roller and attaches itself to the drawing. In this state it is said to be charged, or rolled in. Damped paper is then put over it, and the whole being passed through a press, the printing-ink is transferred from the stone to the paper, and this constitutes the impression. By repeating in this manner the operations of damping the stone and rolling in the drawing, an almost unlimited number of impressions may be obtained.

Now, as we have said, the modes of lithography are various, but the illustration just given will explain the principle of them all. It consists in the mutual antipathy of oil and water, and the affinity which the stone has for both, *i.e.* in its power of imbibing either with equal avidity.

It will be inferred that, to ensure complete success, great nicety is requisite in the preparation of all the agents employed in this art. Our limits will not allow us to go into details on the modes of manipulation, or the precise composition of the several materials used in making the design and taking therefrom the impressions. All the necessary materials for drawing, &c., on stone, in any style, are supplied by the different lithographic printers. Those who wish to study or practise the art in its full extent will do well to consult 'A Complete Course of Lithography,' by its discoverer, M. Senefelder, or 'A Manual of Lithography,' by M. Raucourt, both translated into English.

Imitations of etchings or pen and ink drawings, writings, &c., executed with the chemical ink upon a *polished* stone, are prepared and printed in precisely the same manner.

Transfer lithography, from the facility of its execution and its great utility, claims especial notice. A paper called '*transfer-paper*' is used to receive the writing in this mode of lithography. This paper has previously had a liquid gummy preparation washed over one side of it, which, when dry, constitutes its face, and the writing being performed with the chemical ink already described, rests upon the gummy surface, and does not penetrate to the paper beneath. When the writing or drawing done on the transfer-paper is dry, the back of it is wetted slightly but equally with a sponge and water; and the paper being very thin, the gum preparation on the front of it becomes at once partially dissolved. In this state the paper is laid, with its face downwards, on a *polished* stone, and being passed through a press, the transfer-paper is found strongly and closely adhering to it. The back of the transfer-paper is now well wetted, and, one corner being first raised, it will readily peel off, leaving the gum preparation, and of course also the writing which was above it, attached to the stone. The gum is then washed off with water, and the preparation and printing proceed in the manner already explained. This mode of lithography being eminently calculated to facilitate the despatch of business, its great utility has been sensibly felt in the commercial departments of the country, and in several of our government offices, as by its means one written despatch can be multiplied at pleasure, without delay or the risk of typographical errors.

Another style of lithography is commonly called '*etching*' or '*engraving on stone*,' although it must by no means be inferred that in this process the stone is incised, but that the results correspond with the clean-cut lines of the graver or etching-needle. A coat of gum-water, with some lamp-black or vermilion mixed with it, to give it colour and render the work visible, is thinly but evenly rubbed over a *polished* stone, and, when dry, effectually protects it from any application of grease. On this gum ground the design is executed with an etching needle, precisely the same as in etching upon copper; and wherever the needle passes, of course the stone is laid bare, and it is best to cleanly remove the gum ground without cutting into the stone. After this some oil is rubbed over the whole surface, and is imbibed by the stone wherever the needle has passed and exposed its surface by removing the ground. The gum is then washed off, and the work may be at once rolled in and printed, without any previous acidulation.

Thus we see that grease anyhow applied to the stone will yield impressions, but that the character of the impression depends, 1st, on the *quality* of the grease; 2dly, on the *quantity* of grease; and 3dly, on the manner in which the grease is *applied*. As illustrations, we refer to the modes already enumerated, in which the application of the chemical preparation in the shape of a *solid chalk*, of *fluid ink*, and of *pure oil*, directly applied to the stone, have been pointed out, and the effects arising from each explained. It is the grease therefore which prints, and the lampblack introduced into the lithographic materials is of no other use than to enable the artist to judge of the quantity of grease imparted to the stone. That it does not in the slightest degree contribute to produce greater darkness in the impression, is proved by a very curious phenomenon. The design may be (and often is, in the progress of printing) washed out with turpentine, so as to become quite invisible; and a looker-on, unacquainted with the subject, would suppose the work to be completely destroyed; but it is the *black* only which has disappeared; the *grease* remains, and on being rolled in again, the drawing re-appears uninjured.

The variation in the quality of the tints, arising from the mode in which the grease is applied, may be further illustrated by reference to the *dabber*, which is an instrument by which tints of exceeding delicacy may be produced. It is made of very smooth leather, being somewhat round on its face, and stuffed with cotton wool. On the *face* of the dabber a lithographic preparation, softer than the chalk, is evenly and thinly applied with a hard brush, and afterwards imparted to the stone by repeated blows with the instrument. The dabber was formerly much in use, particularly for delicate skies; but as lithography has been longer cultivated among us, our artists have acquired greater manual dexterity, and produce tints of the greatest delicacy with the hand alone, which have the recommendation of standing better than those produced with the dabber.

The printing from two or more stones, although not a new discovery (since it was practised in Germany long since by Senefelder and others), has lately been more extensively practised in this country than heretofore. In this style the drawing is first made in the usual way, with chalk on a grained stone, but more slight, the sky and other delicate tints being omitted, and these are superadded from the '*tint stone*.' The tint is executed with facility by the printer on another stone (polished), with a modified preparation of chemical ink, and thus much labour is saved to the artist.

The extreme lights are then scraped out on the tint-stone, and the printer superadds the impressions from it to those already taken from the drawing on the other stone; of course taking great care that the two fit well, or '*register*,' as it is technically called.

Transfer lithography has been applied in other ways than the one already explained: indeed it would be difficult to fix limits to its capabilities, improvable as they may be in the hands of able chemists. Among the transfer modes, that *of printing copper-plate engravings from stone* is worthy of notice. An impression is taken on unsized paper from the copper-plate, and without delay transferred, by passing through a press, to a polished stone; it is then acidulated, and the printing proceeds in the usual way. The impressions thus obtained are scarcely distinguishable from those printed direct from the copper. The advantage which this application of lithography holds out is most apparent where economy or great despatch are important. These objects are both obtained by transferring impressions to several stones, or several impressions to one stone if the design be small, when the numbers can be multiplied with great rapidity, and without the original engraving being at all worn.

Plates of zinc have lately been much used as substitutes for the German stones, in chemical printing, and the practice is then called *zincography*: but excepting the difference of the material on which the work is performed, it is precisely the same art as lithography. Zinc plates have the advantages of greater portability, and of being less liable to break from the pressure in printing, but we have not seen any specimen which would warrant our saying that we think them equal to stone, for the best class of productions.

The purity of the *paper* used for lithographic printing is of very great importance, for however beautiful it may appear to the eye, if either acids or alkalis enter into its composition, or are used in the process of its manufacture, a circumstance of very frequent occurrence, they will certainly prove destructive to the lithographic drawing in the progress of printing. Hence arose a great obstacle during the early practice of lithography in this country. The increased demand for the article however has induced manufacturers to turn their attention to the subject, and papers are now produced for the express purpose of this art, which are free from the objections alluded to.

'Aloys Senefelder,' says Mons. Raucourt, 'an actor of one of the theatres at Munich, was the first to observe that calcareous stones had the property of receiving greasy lines and transmitting them to paper. He remarked that, by wetting the stone, it was possible to charge it again with ink, and obtain a series of impressions: he thus became the inventor of lithography.' Although it was long a practice to decry this art, it is hoped that its merits and advantages are now sufficiently felt to make it unnecessary for us to say much in its behalf. If, as a general principle, an original drawing is better than a copy, then is lithography entitled to the respect of all who desire the general improvement of the public taste; which must surely be consequent upon a process by which original drawings are multiplied almost without limits; for all lithographic impressions are original drawings, if they be not altered or spoiled in the progress of the printing. The excellence of lithography depends of course, like that of all other arts, upon the skill with which it is performed; and the facility with which drawings are executed upon stone, and impressions of some sort obtained from them, has led to a glut of worthless productions, and a consequent feeling of disgust towards the art in the public mind. It must be admitted that considerable uncertainty attends the result, even when the work is conducted by the best hands; for a variation in the quality of the stone, or any of the materials employed, or even in the temperature of the weather, produces considerable changes in the impressions. But with all these drawbacks, the fine specimens which have been produced are sufficient evidence that, even as a branch of the fine arts, it is every way worthy of esteem; while the commercial advantages of its lower departments, such as the transfer mode, have never been denied or questioned. Our object has not been to enter into minute details, but to explain the *principles* upon which lithography is founded, and to show broadly their application to the different modes or styles; beyond this we have deemed it sufficient to refer to works from which more copious information may be obtained. For an account of the construction of lithographic presses see PRESS.

LITHO'LELAPS. [CIRRIPEDA, vol. vii., p. 208.]

LITHONTRIPTICS (λίθος, a stone, and τρίβω, to rub or bruise), medicines or other means which are thought to possess the power of dissolving stone or calculus in the urinary organs. The calculous concretions which are apt to form in the kidneys or bladder are of very different kinds, originating in different constitutions or in different habits of life or locality of abode. They are also different, not only according to the time of life when their formation began, but they often become varied in the progress of their increase, and are different in the strata of which they are composed.

It requires therefore not only very close investigation into the characters of the urine of a person supposed to be affected with calculous concretion, but also no slight acquaintance with the chemistry and physiology of that fluid, and the great influence of the nature of the food and drink on its composition, to be able to direct the use of medicines which are regarded as lithontriptic. With few exceptions, their employment has been nearly empirical; and aggravation of the case has as frequently resulted as benefit from their employment. The researches of recent chemists and pathologists have given something approaching to a scientific explanation of the circumstances under which calculi form, as well as of their varied characters; so that more good may reasonably be expected from the use of lithontriptics than has hitherto been realised. [CALCULUS.]

Of the twelve or thirteen varieties of calculous concretions which have been discovered in the bladder or kidneys of the human subject, some are of very rare occurrence, while the more common ones may be classed under two distinct heads—those which form under the prevalence of the uric or lithic acid state of constitution, and those which form under the prevalence of the phosphatic state of constitution. These sometimes alternate, and indeed the concretions which belong to the last class have almost invariably a nucleus or centre of the first kind, which shows how very important it is to avoid the causes of the lithic acid formations.

Independent of constitutional peculiarities, the leading causes of the formation of calculous concretions are errors in diet or regimen. The kidney is the great channel for the expulsion from the system of the azotized or nitrogenous principles of the blood, as well as of many saline particles, which were once an integral part of the body, but now effete; and to keep these in suspension, so as to ensure their elimination from the body, a due quantity of an aqueous menstruum is required. Hence whatever reduces the quantity of urine below the proper standard predisposes to the formation of calculi. Now an excess of animal food, particularly if exercise be neglected, and strong wines—in a word, rich living, with indolent habits—are the frequent origin of calculous complaints. Crude vegetables, with bad clothing and exposure to cold and damp, which interfere with the healthy action of the skin, equally predispose to the formation of stone, and thus the poor suffer from it as well as the wealthy. The causes being so widely different, the mode of treatment must also be different. A specific cannot therefore exist, and all unskilful tampering with a case must lead to most hurtful results. Medicines taken by the mouth have been hitherto more successful in relieving the distressing symptoms (and such alone can be used where the stone is in the kidney) than solvents thrown into the bladder. There is however ground for believing that in certain cases, under competent direction, chemical agents and perhaps galvanism may be made available to dissolve the concretions in the bladder. (See Brodie, *Lectures on Diseases of the Urinary Organs*, 2nd ed., and particularly the very excellent work of Dr. Willis, *Urinary Diseases and their Treatment*, 1838.)

LITHOPHA'GIDÆ, a name applicable to all marine *Conchifera*, *Mollusca*, *Radiata*, &c., that penetrate stones, masses of madrepore, and other hard corals, forming therein a nidus for themselves; but more particularly applied to the *Conchifera*. Whether the perforation be effected by chemical erosion or mechanical action is at present undetermined. Some observations on this part of the economy will be found in the articles CLAVAGELLA (vol. viii., p. 263), and GASTROCHÆNA (vol. xi., p. 94)· others will occur in giving the natural history of *Lithodomus*, *Pholas*, &c., as well as in treating of the species noticed in this article. The erosion is not confined to the *Conchifera* only; for *Patella* has the power of perforating certain rocks to a limited extent: nor to the *Mollusca* generally; for some of the *Echinidæ* (*Radiata*), for instance, are known to make shallow basin-like lodgements in the rocks whereon they dwell. We shall here only refer to one of the last discussions on this subject which took place at a meeting of the Zoological Society in October, 1837. At that meeting Mr. Gray called the attention of the Fellows to some pieces of chalk which he had recently found in the cliffs at Brighton, exhibiting perforations made by the *Patella* and *Pholas*, and presenting appearances which he considered to have been produced in the case of the latter genus by the rotatory action of the valves. His remarks elicited much discussion as to the manner in which certain molluscous genera penetrate limestone rocks and other hard substances, a phenomenon which Mr. Owen thought could not be explained upon the supposition of its being exclusively caused by the rotation of the valves, but that it was chiefly due to the mechanical influence of the currents of water produced by the vibratile *cilia* of the animal, as noticed by Mr. Garner in a communication 'On the anatomy of the *Lamellibranchiate conchiferous* animals,' made to the Society in 1833. (*Zool. Proc.*, 1833, 1837.) This very interesting paper, beautifully illustrated, is published in its perfect state in the 'Transactions' of the Society, vol. ii., and the observations alluded to by Mr. Owen are well worthy the attention of the practical as well as the Zoological reader, for the subject is of high importance practically; as those who are interested in such great public works as the Plymouth Breakwater well know. If this paper should meet the eye of any one so situated as to be able to make a course of experiments relating to the perforations of the marine *Lithophagidæ* and *Xylophagidæ*, and the mode of protection from their attacks, we hope that the inquiry will be patiently followed out. Should the experimentalist succeed, he would be a public benefactor generally, and to this country, where so many submarine works are carried on, both in wood and stone, especially.

Besides the species above alluded to, and others noticed in Mr. Garner's memoir, to whose observations we shall advert in the proper place, certain crustaceans [LIMNORIA] possess the power of perforating wood at least. Excavation is also apparently carried on by the following marine animals. 'Certain *Annelides*,' says Mr. Garner, in the concluding paragraph of his observations on this part of the subject, 'apparently possess this power of excavation. The rocks on our coast are pierced by a minute worm, probably of the genus *Diplotis* of Montagu; it is strongly ciliated, but its mouth does not appear adapted for making its way into such hard substances. By the currents excited by *Vorticellæ*, &c., it is that the erosion noticed at the beaks of fresh-water bivalves takes place; the laminæ at that part being soft and more distant from each other. We find the valves of the *Oyster*, *Pecten*, *Lutraria*, &c., perforated by small circular apertures leading into internal cavities. Dr. Buckland showed this to depend upon the action of a *zoophyte*, which Professor Grant has particularly examined, and named *Cliona celata*. Dr. Buckland considers the holes to be formed by little borers, which the *polypes* possess; these however do not exist, and I believe the phenomenon to be caused by the action of the cilia of the animal.' We have introduced this paragraph, that those who may be led to make the inquiry above alluded to may be aware that there are minute animal agents constantly at work to aid in the work of destruction, though their operations are feeble when compared with the ravages made by the *Lamellibranchiate conchifera* in stone and wood, and by *Limnoria* in the latter substance.

We proceed in this article to the examination of those excavating lamellibranchiate conchifers to which a reference has been given from CONCHACEA, as well as to the consideration of *Saxicava*.

Venerupis.

This form is placed by Mr. Garner in that section of *Dimyaria* (with two adductor muscles) which is distinguished by having the *branchiæ* united medianly; and the characteristic of *Venerupis*, as given by the same author, is to have the *tubes* large, and the *foot* short and prominent behind.

Generic Character.—Animal oblong, rather thick, having the border of the mantle simple, slightly open before for the passage of a compressed and elongated foot; tubes two in number, rather long, united in a considerable portion of their length, and having their orifices ciliated; branchiæ little and unequal; labial appendages very small.

Shell solid, striated, or radiated, a little elongated, gaping posteriorly, more or less irregular, equivalve, very inequilateral, the anterior side being always shorter than the posterior side, which is generally truncated as it were, the other being more or less rounded; umbones marked, nearly contiguous; hinge composed of slender, approximated, and nearly parallel teeth, two in the right valve, and three in the left, or three in each; posterior ligament a little elongated, and in great part external; muscular impressions oval, the posterior one the most rounded, both united by a pallial impression deeply excavated posteriorly.

Such is the character given by M. Rang, who apparently restricts the generic name to those species which excavate stones, &c. 'The shells,' says M. Rang, 'which compose this genus are lithophagous, and excavate in stones and madrepores cavities more or less proportioned to their form and to their volume, wherein they lodge themselves, and out of which when adult they cannot go, the aperture of the excavation being too small to admit of their egress. They are without an epidermis, and generally of a dirty white.'

M. de Blainville, who knew not the animal when he published his 'Malacologie,' divides the genus into three sections; the first exemplified by *Venerupis Irus*; the second by *V. Rupellaria* (genus *Rupellaria*, Fl. de Bell.); third, by *V. lamellosa** (genus *Petricola*, Lam.); and he remarks that if the system of 'engrenage' of the species of excavating *Veneres* be regarded rigorously, we should be compelled to establish as many genera as there are species. He adds that he has chosen *Venerupis* from among the denominations proposed for some of these genera, because it well indicates that the species composing it are *Veneres* of the rock.

Mr. G. B. Sowerby (*Genera*, No. xxviii.) notices the difficulty of ascertaining any distinguishing character between the Lamarckian *Venerupes* and the *Veneres Pullastra*, *decussata*, and others, except in the apparent habits of the animals; a difficulty which had prevented him from endeavouring previously to clear up a point to which his attention had been frequently directed, but which he thinks he has at last overcome. 'It is well known,' continues Mr. Sowerby, 'that *Venus perforans*, Mont., *Venerupis perforans*, Lam., and some of its congeners, live in cavities perforated in chalk and limestone rocks, and that the *Veneres Pullastra*, *decussata*, and several other species that resemble them in general form and appearance, are found buried in the sand; an apparently well marked difference therefore exists in the habits of their respective animals; we think however that we have evidence to prove that there exists in reality very little difference, and that the cavities in which Lamarck's *Venerupes* live are rather the natural consequence of the action of the seawater in conjunction with some of the excretions of the animal upon the chalk or limestone, than of any power of the animals themselves to pierce independently of such action; so that the difference is really only in the nature of the shore on which the very young shells are accidentally deposited, those which are thrown upon a sandy bottom burying themselves in the sand, and such as are deposited upon limestone or chalk producing a cavity in which they live.' Mr. Sowerby then proposes to unite together under one appellation Lamarck's *Venerupes*, and the following of his *Veneres*:—*V. Malabarica*, *papilionacea*, *adspersa*, *punctifera*, *turgida*, *literata*, *sulcaria*, *Textile*, *texturata*, *geographica*, *rariflamma*, *decussata*, *Pullastra*, *aurea*, *virginea*, and some others; and for the genus thus constituted he proposes the name of *Pullastra*, rejecting the term *Venerupis*, or *Venerupes*, because it would convey the false idea that at least the greater number of the species were inhabitants of rocks. [VENERIDÆ.]

M. de Blainville and M. Rang, as we have above seen, restrict the genus *Venerupis* to the species that excavate rocks.

Lamarck makes his *Lithophages* consist of the genera *Saxicava*, *Venerupis*, and *Petricola*; and quotes the opinion of M. Fleuriau de Bellevue that boring shells generally do not pierce stones by the attrition of the shell against the stone, but by means of a softening or dissolving liquor which the animal sheds a little at a time.

Lamarck observes that it is not his intention to assemble under this family of *Lithophages* all the boring bivalves, or all that pierce stones; for, as he truly says, such an assemblage would be rather extravagant. He refers to shells equally excavating with his *Lithophages*, which cannot be separated, some from the *Veneres*, others from the *Modiolæ*, others from the *Lutrariæ*, others again from the *Carditæ*, and remarks that it is not of those that he is then treating. His *Lithophages* consist of those shells, among the boring or excavating conchifers, that gape more or less anteriorly, and have the posterior side short, rounded, or obtuse, with the ligament of the valves always external, which live habitually in stones, and for the reception of which he then knew no particular family, or any family to which they might conveniently be approximated. He observes that he nevertheless places among them some species the habits of which were not known to him. To this M. Deshayes adds in the last edition (1835) a note stating that upon the same ground that it would not be rational to establish a genus or family for the *Modiolæ*, or the *Carditæ*, which pierce stones, it would not be right to reject from the family of the *Lithophages* shells which do not perforate, but wherein we nevertheless find all the essential characters of the species which it contains. For this reason it would be convenient to approximate the *Byssomyæ* and the *Hiatellæ* to the *Saxicavæ*, and to leave in this genus species which do not perforate. M. Deshayes (loc. cit.), who does not appear to have seen the observations of Mr. Garner and Mr. Owen above alluded to, refers to the discussions relative to the means by which perforation is brought about by certain acephalous mollusks. Some authors, he remarks, have supposed that the attrition of the valves against the stone sufficed to wear it away by degrees, and that thus the animal formed a lodgement sufficient to contain it. Olivi, he observes, who was of this opinion, grounded it on the fact that he pretends to have observed that perforating mollusks can attack lavas or other rocks which are not calcareous. 'Since this assertion of the Italian author,' continues M. Deshayes, 'no well made observation has occurred to support it, whilst, on the contrary, a great number of proofs have been collected showing that perforating mollusks are never lodged except in calcareous stones.* This mode of life renders very probable the opinion of M. Fleuriau de Bellevue, who believed that the animal was provided with an acid secretion, by means of which it dissolved, in proportion to its growth, the walls of the cavity which it inhabits. An observation of my own is that the greatest number of perforating mollusks are contained in close fitting cavities by no means made to permit of rotatory motion; that they are oval when the shell is of that form; and that we almost always see rising between the umbones of the valves a calcareous crest which forbids any movement of rotation.' M. Deshayes then proceeds thus:—'Many zoologists have believed that there was but little necessity for preserving the family of the *Lithophages*. M. de Férussac places the *Saxicavæ* in the neighbourhood of the *Gastrochænæ* and the *Solens*, and he places the *Venerupes* near the *Veneres*. M. de Blainville has adopted a nearly similar opinion: we do not admit it any more than that of M. de Férussac, and we shall preserve the family of the *Lithophages* as Lamarck established it in this work. We rest our opinion on the knowledge of many animals belonging to the three genera *Saxicava*, *Petricola*, and *Venerupis*; they are bound by a common relationship (par des rapports communs); thus the mantle, which scarcely opens for the passage of the rudimentary foot in certain *Saxicavæ*, opens a little more in the *Petricolæ*, and more still in the *Venerupes*. The foot follows a nearly analogous development, always remaining however proportionally smaller than in other mollusks in which this organ is necessary for locomotion.'

Lamarck says of the *Venerupes*, or Venuses of the rock, that they seem in fact to have a hinge analogous to that of the *Veneres*, but that nevertheless a slight difference in the disposition of their cardinal teeth suffices to enable us to recognise the genus. They are, he adds, lithophagous or perforating shells which are very inequilateral, and which are not distinguished from *Petricola*, except in having three cardinal teeth, at least, in one valve.

---

* See a note by M. Deshayes (2nd edit. of Lamarck) on V. Irus, pointing out [illegible]

* But see CLAVAGELLA, where a [illegible] is recorded as being perforated; and the observations of Mr. Garner post [illegible].

'The greater part of the *Venerupes*,' observes M. Deshayes in his commentary on this genus, 'differ scarcely from the *Petricolæ*; they offer most frequently three cardinal teeth in one valve, two and rarely three in the other. When in some individuals one of these teeth is abortive, which often happens, the same species may be comprised in the two genera at once. The animals of the perforating *Venerupes* are scarcely to be distinguished from those of the *Petricolæ*; only the mantle is a little more slit and the foot a little longer. In the *Veneres* these parts are different; and this proves that it is necessary to keep separated two genera which Cuvier and M. de Blainville have thought it right to unite or approximate. We do not pretend to dispute, nevertheless, the analogy which is evidently exhibited between certain *Venerupes* and the *Veneres*. We think that the *Venerupes* only ought to be withdrawn from the genus and placed among the *Veneres*, because the animals are in fact similar; only some plunge themselves into hardened mud, whilst others live in the sand. And although they may enjoy the faculty of perforating stone, this would not be a sufficient reason to reject them from the *Veneres*, because we have seen that in a great number of genera belonging to very distant families there exist perforating species; thus we may well conceive that there may be perforating *Veneres*, but that does not hinder us from admitting a genus *Venerupis*, the characters of which appear sufficient to us.'

The number of recent species of *Venerupis* is not great; Lamarck gives seven, and M. Deshayes adds one.

Geographical Distribution.—The range of *Venerupis* is wide; we have species on the coasts of England and France, in the Mediterranean, in the South Seas, and in those of New Holland.

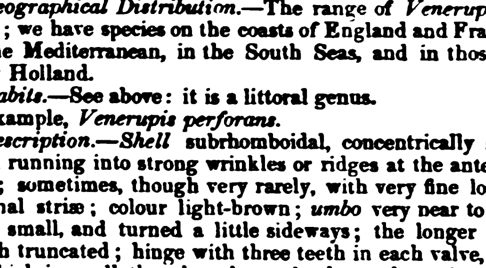
Habits.—See above: it is a littoral genus.

Example, *Venerupis perforans.*

Description.—*Shell* subrhomboidal, concentrically striated, running into strong wrinkles or ridges at the anterior side; sometimes, though very rarely, with very fine longitudinal striæ; colour light-brown; *umbo* very near to one end, small, and turned a little sideways; the longer side much truncated; hinge with three teeth in each valve, one of which is small, the others long, slender, and curving outwards; middle tooth a little bifid. Inside smooth, white, with generally some purple at the truncated end; margin plain; valves moderately concave. Length rarely exceeding 3-8ths of an inch, breadth more than 5-8ths.

Montagu, whose description this is with very slight alteration, says, that with respect to shape it is difficult to fix any as a permanent character; it is however, he adds, most frequently subrhomboidal; sometimes nearly as long as it is broad, generally strait on the front margin, but in some instances deeply sinuous or indented.

Locality.—Coasts of England. Lamarck records a variety smaller and narrower, with substriated lamellæ, from the coasts of France, on the authority of M. Fleuriau de Bellevue.



Venerupis perforans. *a*, from Montagu's figure; *b*, from the shell.

Fossil Venerupis.

M Deshayes, in his tables (Lyell), makes the number of living species eight and of the fossil species (tertiary) six. He also quotes *Venerupis Irus* as being found both living and fossil (tertiary). He does not however note *V. Irus* as fossil in the last edition of Lamarck (1835), and only gives these two fossil species, *V. globosa* and *V. striatula*. M. de Blainville gives the number of fossil *Venerupes* as five.

Petricola (Lam.; including *Rupellaria*, Fl. de Bell.).

Generic Character.—*Animal* oval, thick, especially at the upper part; mantle with simple borders which are a little dilated in front, where they form a rather small opening for the passage of a tongue-shaped and feeble foot: tubes small, in the shape of cones, truncated at their summits, separated for two-thirds of their length, and finely radiated at their orifices: branchiæ small.

Shell rather delicate, without an epidermis, white, radiated, oval, subtrigonal, gaping anteriorly, more or less irregular, equivalve, inequilateral, the anterior side much shorter than the posterior side: umbones not projecting much, and contiguous; hinge composed of small cardinal teeth not diverging much, one of which at least is bifid, to the number of two in one valve, and one in the other, or two in each: ligament external, posterior, short, and convex: muscular impressions oval, united by a pallial impression which is often not very distinct, and has a very deep and rounded excavation posteriorly. (Rang.)

Mr. G. B. Sowerby observes ('Genera,' No. xv.) that the genus *Petricola*, as it stands at present, is composed of several shells which Lamarck thought sufficiently different to form two genera, his *Petricola* and *Rupellaria*, the first with two cardinal teeth in one valve and one in the other, the second with two teeth in each valve; but Mr. Sowerby entirely agrees with Lamarck in the propriety of uniting them. He is not so well satisfied with the place assigned by Lamarck to this and some other genera which form the hollows in stone wherein they dwell; and he thinks that a great degree of similarity in external figure and appearance as well as habit should have brought them nearer to the *Pholadariæ*.

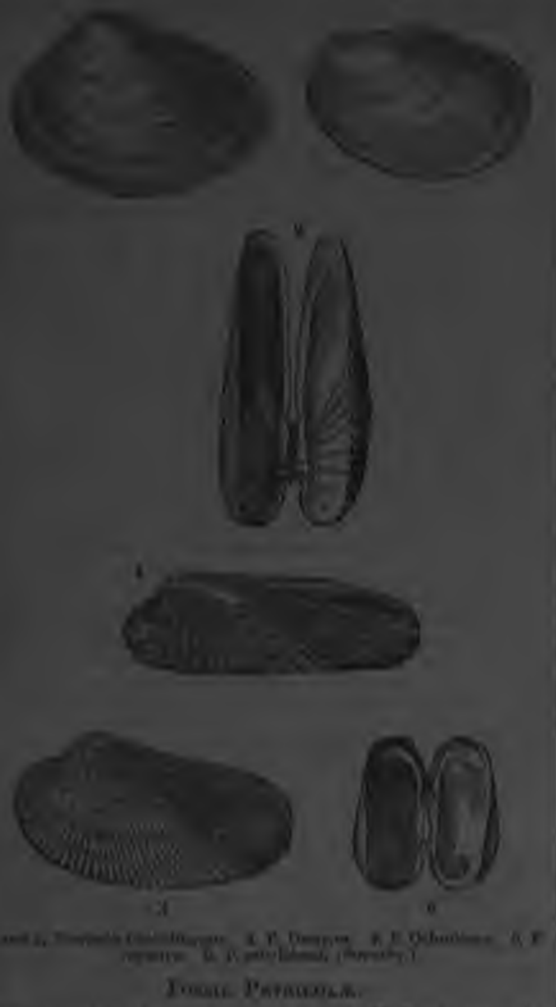
M. Deshayes, in a note to the last edition of Lamarck, is also of opinion that the latter did well in uniting *Petricola* and *Rupellaria*, which exhibit in fact so little difference, that the same species may be placed under either the one or the other genus, according to the state of development or preservation of the hinge. M. Deshayes goes further and says that perhaps we shall be obliged hereafter to unite *Petricola* and *Venerupis*, which in reality differ but little from each other. This resemblance, he adds, exists not only in the shells but also in the inhabiting animals. Mr. Garner appears to be of the same opinion, for in his 'Anatomical Classification of the Lamellibranchiata,' we find the genus *Venerupis*, to which he evidently gives a very large extent, but no mention of *Petricola*.

Geographical Distribution.—Nearly coequal with that of *Venerupis*, as far as the localities of that genus are recorded; and rather numerous on the coasts of the warmer parts of America. (Cuming.) Also found on the Gallapagos Islands. (Cuming.)

Habits, &c.—Much the same with those of *Venerupis*, in the same rock with which, and in its close neighbourhood, *Petricola* is often found. Mr. G. B. Sowerby speaks of the cavities in which they live as being evidently of their own working, though on account of their form they cannot possibly have been produced by a rotatory motion, for they are exactly of the shape of the shell itself, and a very little larger. *Petricola* has been found at depths ranging from the surface or near it to a depth of eleven fathoms.

The species are not few. Lamarck recorded eleven recent, two of which occur also in a fossil state; and two entirely fossil. M. Deshayes does not add to the number of recent species, in fact he expresses his belief that *Petricola lingatula*, one of Lamarck's, ought to be arranged among the *Saxicavæ*; nor does he admit Mr. G. B. Sowerby's *Petricolæ Ductylus* and *subglobosa* ('Genera') into the last edition of Lamarck. The ten new recent species brought to England by Mr. Cuming, and described by Mr. G. B. Sowerby in the 'Proceedings of the Zoological Society' for 1834, were probably not published when the 6th volume of the new edition of Lamarck went to press. M. Deshayes however adds two fossil species, *P. elegans* and *coralliophaga*.

The difference of form is so great in this genus, that we have thought it advisable to give, with permission, representations of the following species from the 'Genera,' by Mr. G. B. Sowerby, instead of the description and figure of one species.



1 and 2, Petricola Lithophaga. 3, P. Dactylus. 4, P. Ochroleuca. 5, P. rugosa. 6, P. pholadiformis. (Sowerby.)

FOSSIL PETRICOLA.

The number of *recent* species given by M. Deshayes in his tables (Lyell) is 15, but some more, as we have seen, have been described since. The number of fossil (tertiary) he places at 10, and gives the species *ochroleuca*, *lamellosa*, and *striata* as both living and fossil (tertiary). Dr. Fitton, in his 'Stratigraphical and Local Distribution' of the fossils in the strata below the chalk, records and figures two species *canaliculata* and *unciformis* from Blackdown.

Coralliophaga. (*Cypricardia*, part, Lam.)

Generic Character.—*Animal* unknown.

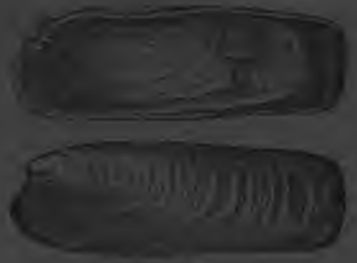
Shell oval, elongated, finely radiated from the summit to the base, cylindrical, equivalve, very inequilateral, the curved summits very anterior and but little developed; hinge consisting of two small cardinal teeth, one of which is subbifid, in front of a sort of lamellar tooth, under a rather weak external ligament; two muscular impressions, which are small, rounded, and distant, united by a narrow pallial impression, a good deal excavated posteriorly.

M. de Blainville established this genus for some species of living shells placed by Lamarck among his *Cypricardiæ*, and which appeared to the former to be approximated to the *Veneres*. M. de Blainville states that M. Deshayes had caused him to remark shells of the same species as that cited by M. de Blainville as the type, and which had modified their form so as to resemble a *Lithodomus* in which they had lived.

M. Rang thinks that this genus is well distinguished from the *Cypricardiæ*, because, in one part, the excavation of the muscular impression announces that the animal has tubes, whilst the other shows that it perforates.

Example, *Coralliophaga carditoidea*, Blainv.; *Cypricardia coralliophaga*, Lam.; *Cardita Carpitus*, Brug.; *Chama coralliophaga*, Gmel.

Locality and Habits.—In the masses of madrepores and other corals at St. Domingo. M. Rang observes that it is in the masses of madrepores so common at the Antilles that the species of this genus should be sought for.



Coralliophaga carditoidea.

FOSSIL CORALLIOPHAGA.

The species here figured is fossil; it is also noted by Lamarck as fossil in Italy, under the name of *Cypricardia coralliophaga*.

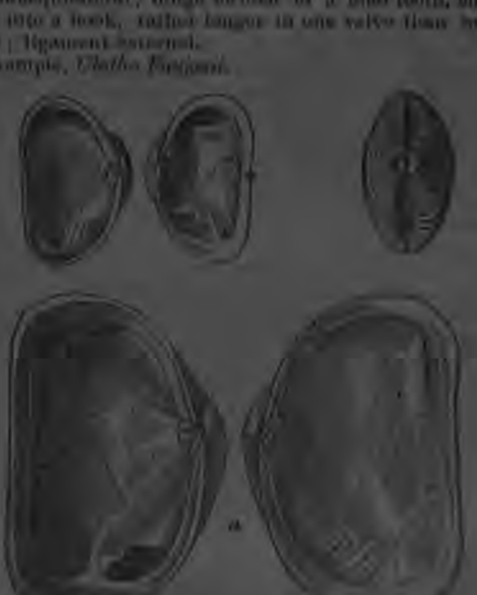
N.B. With regard to this genus the reader should bear in mind that M. Deshayes, who, in the last edition of Lamarck, gives *Coralliophaga carditoidea* of De Blainville as a synonym of *Cypricardia coralliophaga* of Lamarck, says, in a note to the succeeding species in Lamarck's 'Système,' 'These three last species—*Cypricardia rostrata*, Lam., *C. coralliophaga*, and *C. modiolaris*, the first of which M. Deshayes considers to be identical with the antecedent species *C. angulata*, Lam.—are found fossil in the great oolite of France and England. Lamarck, who had not seen their hinge, referred them, from their form, to the genus *Cypricardia*; but I, more fortunate, possess separate valves, from the hinge of which I have cleared away the stony matter, and have remarked that these shells have all the characters of *Crassina*, the genus to which I refer them.'

Clotho. (*Fossil* only.)

Generic Character.—*Animal* unknown.

Shell oval, subregular, striated longitudinally, equivalve, and subequilateral; hinge formed of a bifid tooth, curved back into a hook, rather longer in one valve than in the other; ligament external.

Example, *Clotho Faujasii*.



Clotho Faujasii. *a*, magnified.

This, the only species that appears to be known, was found by Faujas in the shells of *Cypricardiæ*, which were still lying in the stone which they had eroded when alive. M. de Blainville and M. Rang both adopt the genus; but the former says that he had not observed it himself.

Ungulina.

Generic Character.—*Animal* unknown.

Shell longitudinal or transverse, irregular, not gaping, equivalve, subequilateral; umbones sufficiently developed and eroded; hinge formed by a cardinal tooth, which is short and subbifid in each valve, and an oblong marginal furrow or depression, divided into two parts by a contraction; ligament subinternal, and inserting itself in these depressions; muscular impressions elongated; pallial impression not flexuous. (Rang.)

Geographical Distribution.—M. Rang notes the locality as unknown in his 'Manuel;' but the locality for *Ungu-*

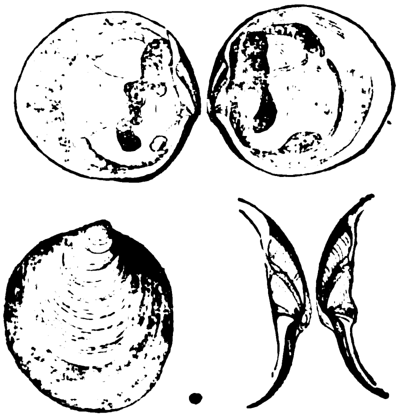
lina transversa, given in Lamarck (last edit.), is 'the seas of Senegal,' on the authority of the former. Mr. G. B. Sowerby has also received specimens from Senegal, and says he has good reason to believe that they are marine.

The latter naturalist observes upon this genus, that it was established by Daudin and adopted by Lamarck, but is at present almost unknown in this country. He states that in general form and appearance these shells very nearly resemble the *Lucinæ*, and gives it as his opinion that the two species recorded by Lamarck are only accidental varieties of the same.

M. Deshayes does not think that the characters of this genus were well appreciated by Lamarck, and remarks also on its close approximation to the *Lucinæ*. The ligament, he observes, is not internal, as Lamarck thought, but external, and received, as in many *Lucinæ* and *Cythereæ*, upon very flattened *nymphæ*, separated by a deep furrow, in which the most superficial part of this ligament inserts itself. He is also of opinion that the two species recorded by Lamarck (to which in the last edition he has not added) are varieties of one only.

Habits.—M. Deshayes states that observations recently made by M. Rang have shown that the *Ungulinæ* are perforating shells, which, he says, he had already known from a fossil species in the environs of Bordeaux.

Example, *Ungulina transversa*.



Ungulina transversa.

FOSSIL UNGULINÆ.

M. Deshayes, in his tables, records one living species of *Ungulina*, but notices none in a fossil state. It will be seen above that he speaks of a fossil species from Bordeaux in the last edition of Lamarck.

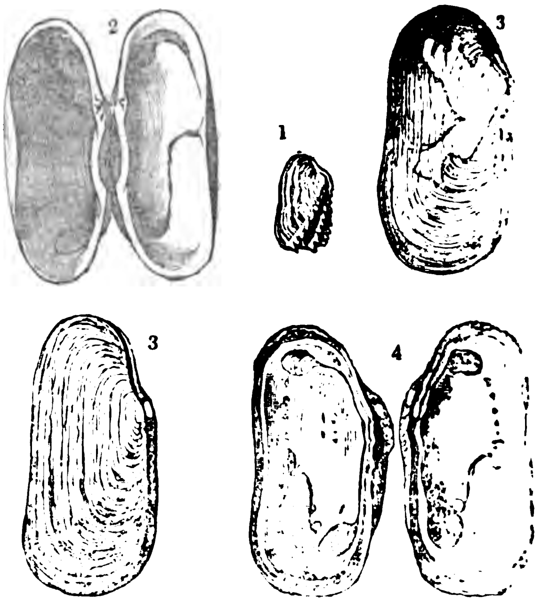
Saxicava.

Generic Character.—Animal elongated, subcylindrical, having the mantle closed on all sides, prolonged backwards by a long tube, double internally, a little divided at its summit, and pierced inferiorly and anteriorly by a rounded orifice for the passage of a small, elongated, delicate, and pointed foot; mouth moderate, labial appendages small; branchial laminæ for the most part free, and very unequal on the same side.

Shell thick, solid, covered with an epidermis, elongated, rounded in front, truncated as it were posteriorly, gaping, irregular, equivalve, very inequilateral, the posterior side being much longer than the anterior; umbones not very distinct; hinge without teeth or with two separated tuberosities more or less developed; ligament external; muscular impressions rounded and a little approximated, united by a small straight pallial impression, very narrow, and occupying the middle of the valve. (Rang, from *Saxicava rugosa*.)

Both M. de Blainville and M. Rang place the genus among the *Pylorideans*. The former is of opinion that it differs but little from *Glycimeris*.

Mr. G. B. Sowerby ('Genera,' No. xxv.) includes in the genus *Saxicava* shells which, he observes, have had, in conformity with the various views of authors, at least six different generic names. He apologises for the conclusion to which he has come in contradiction to so many great authors, but gives the following reasons for his opinion. He premises that it will not be disputed that *Solen minutus* f Chemmitz and Montagu, *Hiatella arctica* of Daudin, *Cardita arctica* of Bruguière, and the *Byssomya* of Cuvier, are one and the same species; and that Leach's *Pholeobius* includes as distinct species of the same genus the *Solen minutus* of Montagu and the *Mytilus rugosus* of Linnæus: 'now the former of these,' continues Mr. Sowerby, 'is *Hiatella arctica* of Lamarck and Turton, and the latter *Saxicava rugosa* of the same authors: thus all the six genera are reduced to one by Dr. Leach, whose authority is indisputably very great in such matters: we do not however propose to our readers to take it as conclusive, but will state that we possess, as Dr. Leach did, a series of specimens, the young ones of which are more regular in shape and more strongly spinose than the older, and are to all intents and purposes *Hiatella arctica*, or *Solen minutus*, and the older specimens, losing the strongly-marked double rows of spines, though always retaining indications of them, and assuming a much less regular form, become characteristic specimens of *Saxicava rugosa:* the hinge teeth of the younger specimens may be advanced as an argument against the identity of these shells: it is however well known that in many shells, particularly those that are irregular, the teeth become obsolete with age: thus if the hinge teeth, the general form of the shells, or the double row of spines, cannot be depended upon as generic distinctions, the Lamarckian genera *Hiatella* and *Saxicava*, and his *Solen minutus*, merge into one: to show that the shells described as distinct species under either of these generic names are identical is not important to the present work; it is therefore sufficient to observe, that in all irregular shells that are either found attached to or imbedded in rocks, corals, roots of sea-weeds, &c., the general form cannot be taken as a character; and we believe the *Mytilus præcisus* and several of the *Saxicavæ* described by Lamarck and Turton to be merely variations of *S. rugosa*, than which there is perhaps no shell more subject to variety of form.' To illustrate this exposition, Mr. G. B. Sowerby gives in his 'Genera' the following figures of *Saxicava rugosa* in different stages of its existence.



Saxicava rugosa.

1, the young shell; 2, inside, showing the teeth; 3, a full-grown specimen of the same; 4, the inside, showing the muscular impressions.

M. Deshayes observes, in the last edition of Lamarck, that the latter knew but a very small number of *Saxicavæ*, and has not mentioned any fossils, of which last there are eleven or twelve species. 'When,' continues M. Deshayes, 'we examine the shells of *Byssomya*, and compare them with those of *Saxicava*, we find no difference between them, whilst in the animals a much greater discrepancy exists, because the *Byssomyæ* do not perforate, and carry, like a rudimentary foot, a byssus, like that of the *Mytili*: the mantle is closed for a good part of its length, and is prolonged backwards into two siphons joined together at the summit. If we appreciate these differences at their just value, we may easily perceive that they are not of so great importance as they appear to be; for the byssus is a method of living in the same spot (en même point), as well as the faculty of penetrating stones

We must consider the character of the byssus in the *Byssomyæ* as of little value; for the greater number of zoologists have united this genus to the *Saxicavæ*.' M. Deshayes then goes on to observe that Lamarck has comprised the same species under two very different genera, and that his *Solen minutus* and *Hiatella arctica* are the same shell; to be satisfied of which, one has only to compare the synonym. 'The fact is,' he adds, 'that the shell in question is not a *Solen*, and ought not to constitute a particular genus; for it belongs to the byssiferous *Saxicavæ*, as we have satisfied ourselves that it does by an examination of the animal.'

M. Deshayes further observes, in a note to *Saxicava Australis*, that all shells which, like those of this genus and the two following (*Petricola* and *Venerupis*) are cramped in their development, put on different forms, so as to impose upon the most acute observers, especially when the observation is confined to a small number of individuals. This happened, he adds, to Lamarck, who has given to the same shell the names of *Corbula Australis*, *Saxicava Australis*, and *Saxicava veneriformis;* so that in a well executed catalogue it would be necessary to unite these three species under one name, and arrange them among the *Saxicavæ*.

Geographical Distribution.—Very extensive. The Northern Ocean, the Britannic seas, the Mediterranean, the South Seas, Australasia, and the warmer coasts of America, are recorded as localities.

Habits, &c.—Mr. G. B. Sowerby remarks that the *Saxicavæ* are frequently found upon the outside of oysters, protected by their irregularities, and in clefts of rocks or corals, roots of sea-weeds, and perforating oysters, chalk, limestone, and hardened clay. Those, he adds, which themselves perforate the hollows in which they live are more regular than others.

Mr. Garner states that the crypts of *Saxicava* are not circular: hence M. de Bellevue and Mr. Osler, in this instance, believe them to be formed by the phosphoric acid secreted by the animal, and they suppose this animal to inhabit those rocks only which are composed of carbonate of lime, which last supposition Mr. Garner declares to be not correct to his own knowledge.

Mr. G. B. Sowerby observes that the species of this genus are not numerous, and that they are not easy to distinguish from each other, as the reader may imagine from the confusion which has prevailed on this subject. Lamarck recorded five species. Of the first two of these (*Saxicuva rugosa* and *S. Gallicana*), one, according to M. Deshayes, must be suppressed, being in reality only a variety of the other. *Saxicava Australis* and *S. veneriformis*, Lamarck's fourth and fifth species, are identical, as we have already seen. To these M. Deshayes adds *S. Guerini*, from the Mediterranean, and *S. rhomboides?* as recent species. Mr. G. B. Sowerby (*Zool. Proc.*, 1834) has added three recent species collected and brought home by Mr. Cuming.

Fossil Saxicavæ.

Lamarck, as we have above noticed, characterised no fossil *Saxicavæ*. M. Deshayes, in his tables, gives the number of recent species as 5; and 11 as the number of fossil species (tertiary). He notes two species, *S. minuta* and *S. Pholadis*, as both living and fossil (tertiary). We do not find *S. minuta* recorded at all in the last edition of Lamarck (1835), nor is the fossil designation added to *S. Pholadis*. Of fossil species only five are recorded, unless we regard *Saxicava rhomboides* (Desh.) as fossil only, which the synonyms (*Donax rhomboides*, Poli, *Solen minutus*, Linn., and *Hiatella arctica*, Lam.) seem to forbid. There is no recent 'habitat' given; but there can be little doubt that it is identical with the living and fossil *S. minuta* of the tables of M. Deshayes.

The reader will bear in mind that the ravages of the stone-excavating genera noticed above, though considerable when they congregate in numbers, are superficial in comparison with the destructive operations of *Pholas* and *Lithodomus*.

LITHOSTROTION, the name given by Llwyd, and adopted by Fleming, to some fossil 'madrepores,' as the lamelliferous corals are commonly termed, which appear confined to the older strata (especially mountain limestone). They are included in Cyathophyllum of Goldfuss by Professor Phillips (*Geol. of Yorkshire*, vol. ii.), and in Columnaria by Blainville (*Actinologie*, p. 350).

LITHO'TRYA. [Cirripeda, vol. vii., p. 208.]

LITHO'TOMY (from λίθος, a stone, and τέμνω, to cut) Although urinary calculi may be extracted from the kidneys, urethra, or bladder, the term lithotomy is restricted to the operation of cutting into this latter viscus for the purpose of removing one or more stones. From the complex nature of the fluid secreted by the kidneys, and the quantity of saline matters which it holds in solution, deposits not unfrequently take place in one or other of the cavities to which the urine has access. Hence solid concretions, or urinary calculi, may be met with in the kidneys, ureters, bladder, or urethra; but the majority of these concretions are believed to be formed originally in the kidneys. Now, if we suppose one of these calculi to have descended into the bladder, it is easy to imagine that it would there form a nucleus, around which the addition of fresh matter would be constantly adding to its bulk. A priori reasoning would lead us to suppose such to be the result, and that this actually takes place is proved by the fact that many calculi have for their nucleus foreign bodies that have accidentally entered the bladder, as bullets, splinters of bone, bits of bougie, &c. The number and size of calculi met with in the bladder differ as much as their form and composition vary, and their magnitude is generally in an inverse ratio to their number. A case has lately been recorded in which 398 calculi, from the size of a pea to that of an olive, were found in the bladder after death; while, in a case described by the late Sir James Earle, a stone was extracted after death which weighed forty-four ounces, its long axis measuring sixteen inches, and the shorter fourteen; but the average size of vesical calculi is about that of a walnut. Their form is mostly spheroidal, or egg-shaped, and sometimes flattened on two sides like an almond.

According to their composition, they are either soft and friable, or very dense and hard, and their surface may be quite smooth or beset with numerous tubercles. These circumstances, together with their loose or fixed position in the bladder, have considerable influence in determining the comparative severtiy of the symptoms. Children and aged persons are more subject to the disease than those in the vigour of life, and males than females; the inhabitants of temperate climates, than those of higher or lower latitudes.

Symptoms of Stone in the Bladder.—These consist in a troublesome itching, sometimes amounting to pain, at the extremity of the penis, with a frequent desire to make water and evacuate the bowels; the urine is voided with great pain, particularly the last drops, and while flowing in a full stream is liable to be suddenly arrested, from the stone falling against the vesical orifice of the urethra. When much irritation is present, the urine on cooling becomes cloudy, and deposits a large quantity of ropy mucus, not unfrequently mixed with blood, especially after any rough exercise. All these symptoms vary in degree, according to the size of the stone and the smoothness or roughness of its surface, its fixed or loose position in the bladder, the quality of the urine, and the condition of the bladder. Instances are recorded of persons living with stone in the bladder for years, yet suffering little or no inconvenience from it, but these cases must be considered exceptions; in general the health sooner or later gives way, and, without recourse to one of the operations we are about to speak of, the patient lingers out a miserable existence till death terminates his sufferings. Nearly all the symptoms we have just described as belonging to stone in the bladder may however be simulated by other diseases of the bladder or neighbouring parts; a positive diagnosis therefore can never be made before *sounding* the patient. This consists in introducing into the bladder, through the urethra, a metallic instrument called a sound, by means of which the stone can be plainly felt, and an audible noise perceived on striking it: till this be rendered evident no surgeon would be justified in undertaking the operation. It sometimes happens that stones are forced, by the violent contractions of the bladder during fits of the complaint, between the fasciculi of the muscular coat of this viscus, so as to become what is termed encysted; or they may become adherent to some portion of the parietes of the bladder: under these circumstances the surgeon would hesitate before he undertook the operation.

Modes of performing Lithotomy.—To describe at length the various modes of operating for the stone, and the modifications which each method has undergone, would occupy too much space in a publication not strictly surgical; we shall therefore merely glance cursorily at those formerly in use, while we direct our attention more particularly to the method which is employed at the present day.

Of the Apparatus Minor, Cutting on the Gripe, or Celsus's Method.—This is the most antient kind of lithotomy, and has probably been practised from time immemorial; but Celsus having first described it, it has been called *Lithotomia Celsiana*; and from the stone, previously fixed by the pressure of the fingers in the anus, being cut directly upon, *cutting on the gripe*, a knife and a hook being the only instruments used. The appellation of the *lesser apparatus* was given to it by Marianus, in order to distinguish it from a method which he described, called the *apparatus major*, from the many instruments employed. The objections to cutting on the gripe are,—1st. It is only applicable to children under fourteen years of age. 2nd. It is uncertain what parts are divided; this depending on the degree of force employed in making the stone project in the perineum. 3rd. The injury liable to be inflicted on parts whose integrity is essential to the success of the operation.

Apparatus Major, or Marian Method, was founded on erroneous principles, and in ignorance of the nature of the parts to be operated on. It was supposed that wounds of membranous parts would not heal, while their dilatation might be undertaken with impunity. In conformity with these notions, the precept of Celsus, 'Ut plaga paulo major quam calculus sit,' was neglected, and the object endeavoured to be attained was, to do as little as possible with the knife, and as much as possible with instruments called dilators; but the parts thus subjected to attempts at dilatation are inelastic, and consequently were lacerated. The severe injury thus produced rendered this one of the most fatal operations in surgery; but notwithstanding this, it was practised for near 200 years, till Frère Jacques, in 1697, taught at Paris the method at present in use.

High Operation—so named from the incision into the bladder being made above the pubes, was first practised in Paris in 1475, by Colot, as an experiment on a criminal, by permission of Louis XI.; but the earliest published account of this mode of operating was in 1556, by Pierre Franco. This method is most applicable to those cases in which the stone is too large to be extracted from the perineum, or where there is disease of the urethra and prostate gland; but there are several objections to it, and it is now entirely abandoned.

Operation through the Rectum.—This method was first suggested in a work published in the sixteenth century; but the proposal never received much attention till the year 1816, when it was revived by M. Sanson, of Paris, and carried into operation by him and by Dupuytren; but the unfavourable results which attended the performance of this operation prevented its being generally tried or adopted, and no one of the present day ever thinks of performing it.

Lateral Operation—so called from the prostate gland and neck of the bladder being cut laterally, in order to avoid wounding the rectum, is that adopted at the present day. It was first practised by Pierre Franco, a surgeon at Tourrières, but he never established the method as a permanent improvement in surgery; this was left for Frère Jacques, a priest, who, in 1697, came to Paris in order to make known this method, which he employed with great success at various places. Although it appears that he was not quite so successful as he had led the world to believe, the superiority of his mode of operating was immediately perceived and recognised, and, with slight modifications, was adopted by most of the surgeons of that period. Hitherto the Marian section had been used: the advantages of an operation by which a free opening was made into the bladder, over one in which it was so small as not to admit of the extraction of the stone without laceration of the parts, are too obvious to require comment. Surgeons of the present day differ somewhat as to the extent of the opening to be made into the bladder, and on the choice of instruments to be employed; some make use of a common scalpel, which cuts into the bladder from without inwards; while others prefer the bistoire caché, or gorget, which divides the prostate gland and neck of the bladder from within outwards. Having premised thus far, we will proceed to describe the operation as usually undertaken with the cutting gorget. The patient having been sounded, to ascertain that the stone is actually within the bladder (for instances have occurred of stone becoming encysted a short period before the operation), and the rectum being emptied by means of a clyster, he is placed on his back upon a table, with his buttocks projecting rather beyond its edge; he should be directed to grasp the outside of each foot with the hand of the same side, and the two pair should then be firmly bound together. A *staff*, which is an instrument shaped very much like a catheter, or sound, but somewhat longer, and grooved on its convex side, is passed through the urethra into the bladder, where it must be retained firmly by an assistant; its convexity looking towards the perineum, and the groove slightly inclined to the left side of the patient. The operator now commences his incision below the bulb of the urethra, about an inch and a quarter in front of the anus, and continues it obliquely downwards to the left of the raphé of the perineum for three inches, till it reaches midway between the tuberosity of the ischium and the anus: this should cut through the integuments and superficial fascia. The next incision, made in the same direction, divides the transversus perinei muscle, and exposes the membranous portion of the urethra, which must be opened, and the groove in the staff felt for with the finger; into this groove, which serves as a director for making the concluding section of the operation, is inserted the beak of the *gorget* (a sort of knife terminated by a beak, that fits into the groove of the staff). The operator now rises from his chair, and, taking the staff in his left hand, raises its handle from the abdomen till it forms nearly a right angle with the patient's body; the gorget is now pushed onwards, along the groove, till it enters the bladder. By raising the handle of the staff the gorget is made to enter the bladder in a direction corresponding with its axis, and the danger of wounding the rectum is thereby avoided. As soon as the gorget has been introduced the staff is withdrawn, and a pair of long forceps, expressly adapted for this operation, is passed along the gorget into the bladder, and this latter instrument withdrawn. The stone is now to be seized, and gently extracted; but it sometimes happens that a stone is too large to be removed without using a degree of force that would be perfectly unjustifiable: in this case, if the wound will not admit of further enlargement, nothing remains to be done but crushing it, and thus taking it away piecemeal. A stone should always be examined immediately after it is extracted, because its appearance conveys some information concerning the existence of others; and in every instance the cavity of the bladder should be explored with the finger, to ascertain that there is no other stone present. Encysted calculi seldom require an operation for their removal, but should this be necessary, the cyst may be opened by a blunt-pointed bistoury, and the stone taken away. When a stone is known to be of ample size, some operators perform what is called the bilateral operation, from both sides of the prostate gland being cut; for this purpose a double-edged knife has been invented, called the *double lithotome*; but Mr. Liston is of opinion that no complicated machine is requisite to make this bilateral division, and that it is quite time enough to do it when the necessity for it has been ascertained.

Lithotomy in Women.—From the shortness, largeness, and very dilatable nature of the female urethra, the surgeon is seldom called upon to perform the operation in women. The formation of calculi is perhaps not less common in women than in men; but from the anatomical circumstances just alluded to, stones of considerable magnitude have been voided spontaneously. This fact has suggested the plan of mechanically dilating the urethra, and thus extracting them without the employment of any cutting instruments; but where the stone is very large, the degree of dilatation necessary for its extraction is liable to produce paralysis of the part, and incontinence of urine ever after. To avoid these evils, an artificial opening should be made into the bladder. The operation is simple. A strait staff, or director, is introduced through the meatus urinarius; the groove is turned obliquely downwards and outwards, in a direction parallel to the ramus of the left os pubis; and the knife is thus conducted into the bladder, and makes the necessary incision through the whole extent of the passage and neck of the bladder.

Treatment after the Operation.—The dangers to be guarded against after an operation of lithotomy are, inflammation of the bladder and peritoneum; infiltration of urine into the cellular texture of the perineum and parts adjacent; and hæmorrhage. To prevent the dangers that would arise from inflammation, the patient should be kept perfectly quiet, and on a low regimen; but supposing it to have set in, the most prompt and energetic measures must be had recourse to, copious venesection, the use of the warm bath and fomentations, with the administration of such medicines as are known to be most efficacious in such cases afford the only chance of preserving the patient. Infiltration is to be avoided by placing the patient in such a position that the urine can flow readily from the wound, which should be left uncovered, or this end is attained more effectually by introducing an elastic gum catheter into the bladder, and suffering it to remain there for the first two or three days. Hæmorrhage is fortunately a rare occurrence; but should this take place, pressure, made by means of sponge or lint compresses, may be tried; and if this fail, the bleeding vessel must be sought for and tied.

LITHOTRITY (from λίθος, a stone, and the root τρι, to rub), *Lithotripsy* (from λίθος, and τρίβω, to break). 'The reduction of a calculus in the bladder into small pieces, by means of instruments passed into that organ through the urethra, so that the fragments may be discharged through the latter tube, and no necessity remain for the performance of lithotomy.' This operation, which must be ranked among the most brilliant achievements of modern surgery, was first seriously proposed in 1812, and Gruithuisen, a Bavarian surgeon, constructed an apparatus for performing it. But the originality of the idea was probably derived from ancient writers, several of whom speak of the possibility of breaking stones within the bladder, although they make no mention of the mode of performing it. At the commencement of the sixteenth century, Rodriguez, a physician of Malaga, is said to have broken a stone in the bladder by striking it with a catheter; but the first suggestion we meet with of an apparatus constructed expressly for this purpose is by Gruithuisen. It consisted of a wide straight tube, which was introduced through the urethra into the bladder. Through the tube was passed a noose of copper wire (by which the stone was caught hold of and fixed) and a rod terminating in a circle of teeth or a spear-point; a drilling-motion was now given to the latter instrument by means of a bow, and the stone was thus perforated or broken. Since this period, the operation has undergone successive improvements in the hands of Leroy, Civiale, and Heurteloup. The following is the mode of proceeding adopted by the last gentleman. The patient is placed on an operating bed, so constructed as to admit of any inclination being given to it that the operator may think proper. At its foot is an apparatus for affording a fulcrum to the instrument which is to be passed into the bladder; and two stirrups, securely fixed at a short distance on each side of the apparatus alluded to, serve for securing the feet of the patient, who is placed in a position nearly resembling that chosen for the operation of lithotomy. The bladder is now moderately distended with warm water injected through a catheter. A pair of strong sliding forceps, the opposite surfaces of which are furnished with teeth, are then introduced; and the calculus having been seized, the lower piece of the forceps is fixed to a vice at the foot of the bed serving as a fulcrum, and the upper piece is struck with a hammer and the calculus broken. Thus, neither the shock arising from the percussion is communicated to the bladder, nor is this organ liable to be injured by the fragments being forcibly projected against its internal surface. The instruments are then withdrawn, and the fragments are afterwards voided with the urine; or if any remain too large to be thus discharged, the operation is repeated from time to time till all is got rid of. It were to be desired that an operation so simple, productive of so little pain, and so entirely free from the dangers attendant on the operation of lithotomy, was more generally applicable than it is found to be, but it is subject to the following disadvantages. The patient does not obtain a cure at once, and in many instances the operation is required to be repeated several times; and as the smallest fragment which remains behind will form the nucleus of a new stone, a recurrence of the disease is more likely to take place after this operation than after lithotomy. It is unfit for calculi formed on extraneous substances which have entered the bladder, for encysted or adherent calculi, for large or very hard calculi, for patients with enlarged prostate gland or diseased bladder, and for children. The accidents liable to arise from the operation are generally less grave than those to which the operation of lithotomy is subject; two of the most serious that have taken place are perforation of the coats of the bladder and the breaking of the instrument within this viscus. But where the stone is small and not too hard and other favourable circumstances are present, we imagine few would be found who would not give it the preference over the operation of lithotomy.

LITHUA'NIA, a large tract of country which now forms some important provinces of the Russian empire, but which once constituted an independent and powerful state until it was united to Poland by the accession of its reigning dynasty to the throne of that country. Its history is very remarkable, and presents a most extraordinary instance of a nation which, after having remained for centuries in a state of utter insignificance, assumed, by its conquests and wise policy, in a comparatively short time, a station which rendered it for about a century the most formidable power of the north.

The early history of Lithuania is involved in much obscurity, and the several traditions contained in its chronicles are exceedingly confused. A current tradition that a Roman colony had settled on the shores of the Baltic has been shown to be a mere fable. There are some very ingenious conjectures that the Heruli, who destroyed the Western empire under Odoacer, were inhabitants of Lithuania, and that after their expulsion from Italy they returned to this country, and brought with them those words, resembling the Latin, which abound in the Lithuanian language.

The first mention of Lithuania occurs in the chronicle of Quedlinburg, A.D. 1009 (Naruszewicz, *Hist. of Poland*, vol. iv., p. 142.). From that time the name of Lithuania begins to appear more frequently in Russian chronicles, which speak of the Lithuanians as a poor and savage nation, some tribes of which were compelled by the bordering Russian princes to pay a tribute, consisting of the bark of birch trees for making oil, of ropes made of the bark of lime trees, and of brooms. The rudeness and poverty of the nation must have been very great if their conquerors were satisfied with such sylvan produce. In the twelfth century the Lithuanians began to be more known, particularly by their wars with the German knights.

Towards the year 1200, Albert, bishop of Riga, founded the order of the Knights Sword-bearers (Ensiferi), in order to conquer the pagans who inhabited the shores of the Baltic from the Curonian Haff to the Gulf of Finland. The half-savage barbarians were soon subdued by the valour and military skill of these warrior monks, and reduced to a state of the most oppressive bondage. Not long after, about 1230, Conrad, duke of Masovia, being unable to resist the predatory attacks of the Prussians, a branch of the Lithuanians, called to his assistance the Knights of St. John of Jerusalem, and granted them a large tract of land, with many castles. These knights did the same in Prussia that the Sword-bearers had done elsewhere, and the two orders acquired new strength from their union, which was effected in 1238, and became most formidable enemies to their neighbours, particularly to the unconverted Lithuanians. These priestly soldiers were certainly the bravest, the most skilful, and the best armed militia of that time, and their numbers were continually recruited by German adventurers, who flocked to their standard in order to obtain the remission of their sins and a grant of lands wrested from the native idolaters. Such were the enemies with whom the Lithuanians had to contend, they themselves being ignorant of the science of war, almost destitute of defensive armour, and having for the most part no other weapons than spears, clubs, and arrows. In spite of these disadvantages they not only resisted the German invaders but gained possession of some of those Russian principalities to which they had been obliged to pay tribute. The decline of the powerful Russian principality of Halicz, by the death of Prince Roman, who was defeated and killed by the Poles in the battle of Zawichost, 1205, delivered the Lithuanians from a formidable enemy, and their predatory incursions began to be more dangerous to the Polish and Russian principalities; some of the latter fell into the hands of Lithuanian chieftains, who generally sought to consolidate their acquisitions by embracing the creed (that of the Eastern Church) of their new subjects, although the bulk of the Lithuanian nation remained faithful to their idols.

Ryngold was the first Lithuanian ruler who, after having united under his dominion all the principalities of that nation, assumed the title of Grand Duke of Lithuania about 1235. His son Mindog, having received from the Pope the royal diadem, embraced Christianity, and was crowned at Novogrodek in 1252 (formerly the capital, now an insignificant town), by the archbishop of Riga and another Roman Catholic prelate; but not having obtained the advantages which he expected from his conversion, he soon relapsed into paganism. At the end of the thirteenth century Witenes established a new dynasty on the throne of that country; but Lithuania's most brilliant æra began after the accession of the grand-duke Ghedymin in 1315. He made most extensive conquests in the south-western principalities of Russia, and consolidated his power by insuring the most perfect protection to the religion, language, customs, and property of the inhabitants of the conquered lands. But the most extraordinary circumstance of that conquest is, that those newly acquired provinces were intrusted only to the administration of such princes of the Lithuanian dynasty as had embraced the religion of the conquered population, whilst the sovereign still remained an idolater. This wise policy, so contrary to the spirit of intolerance displayed by other conquerors, strongly attached the Russian Christians, who were five times as numerous as the real Lithuanian population, to their new masters, under whose sway they found that repose and security of which they had been for a long time deprived by the internal feuds of their petty princes, and the incessant annoyance from the Mongols, who, possessing the north-eastern principalities of Russia, constantly attempted to extend their rule over those parts which became now a portion of the Lithuanian empire.

Two nations, of a different origin and creed, thus became soon blended together, and the Russian Christians were always the most loyal subjects of the pagan grand-dukes of Lithuania. The Russian became the official language of Lithuania, and continued so till the middle of the seventeenth century, when it was superseded by the Polish language.[*]

The government of Lithuania was in some degree feudal: each province was given in fief, generally to a prince of the reigning family. There was not however anything like the regular feudal organization of western Europe. After its union with Poland, Lithuania was governed by the same forms as that country.

Ghedymin was killed in 1328, at the siege of the fortress of the German knights. He divided his empire among his several sons, but after some contention, one of them, called Olgherd, assumed the sovereign power. He proved a worthy successor to his glorious father: he defeated the Tartars, and compelled those of Crimea to become his vassals, having extended the limits of Lithuania to the banks of the Don and to the shores of the Black Sea. The republics of Novogorod and Pskow acknowledged his supremacy, and he presented himself in triumph before the gates of Moscow in the years 1368, 1370, and 1373. He died in 1381, in the Christian community of the Greek church, which he embraced on his death-bed, at the solicitations of his wife, who was a Russian princess of Twer. It is even supposed that he had secretly been a Christian during his lifetime, and had early become a convert to its doctrines.

Olgherd's son and successor, Yaguellon, married, in 1385, Hedvige of Anjou, queen of Poland, and, having been baptized, ascended the throne of that country. From that time Lithuania was united with Poland.

Yaguellon, having become a Christian, strenuously exerted himself to convert his pagan subjects. The attachment of these idolaters to their religion seems to have been at that time very weak, and Yaguellon had no great difficulty in accomplishing his task. It is asserted by the chronicles that the promise of a new white woollen coat was sufficient to induce the Lithuanian pagans to desert their idols and to approach the baptismal font.

Yaguellon himself translated for the use of his subjects the Creed and the Lord's Prayer into the Lithuanian language. It was natural for the new converts to retain for a long time many heathen rites, and even in our days the common people preserve many customs evidently derived from their idolatrous forefathers. Although by the accession of Yaguellon to the throne of Poland the two countries became united, it often happened that the kings of Poland of the Yaguellonian family, who were hereditary sovereigns in Lithuania, but elective in Poland, after their accession t the crown of the latter country, gave up the government o Lithuania to a prince of their family, but still retained th sovereignty. The most celebrated of those princes wa Vitold (1430). A kind of union of the two countries was effected at the diet of Lublin in 1569, composed of senator and deputies of both nations. By this transaction the rig of the Polish nobles were extended to those of Lithua whose throne became elective like that of Poland. T diets of the two countries were held in common, but th laws, finances, and armies remained separate. This state o things continued till the fall of Poland.

We have already said that Lithuania extended under th reign of Olgherd as far as the banks of the Don and t shores of the Black Sea. It lost a great part of its d minions under the reign of Casimir III., king of Po and grand-duke of Lithuania, and on several subsequ occasions. But these events belong to the history of Pol of which Lithuania then formed an integral part. At t time of the first dismemberment of Poland in 1772, Lit ania was divided into the following palatinates or count Vilna, Troki, Novogrodek, Brest, Vitepsk, Polock, Msti and the duchy of Samogitia.

The territory which constituted the government duch Lithuania at the above-mentioned time now forms Russian governments of 1, Vilna; 2, Grodno; 3, Bi tock; 4, Minsk; 5, Mohilew; and 6, Vitepsk; and, 7, palatinate of Augustov, in the kingdom of Poland, co tuted by the treaty of Vienna, 1815. The extent and p lation of this province are as follows:—

Vilna	22,970	Eng. sq. miles	1,357,400 p
Grodno	6,930	„	868,100
Bialystock	3,360	„	224,600
Vitepsk	14,190	„	934,900
Mohilew	19,500	„	985,400
Minsk	38,930	„	1,163,100
Augustov	19,000	„	335,000[*]

Lithuania is generally a flat and low country, alth there are some hills in the environs of Vilna. The n western part, comprehending the duchy of Samogiti very fertile, and celebrated particularly on account o flax. The banks of the Niemen are also generally fe and in many parts very picturesque. But the greater p of this country is covered with sand, marshes, and Ferruginous ochre is found in all the peat-mosses, bu quantity of iron is very limited, and many iron-works w formerly existed are now abandoned in consequence o cheaper rate at which iron can be got from the mines i north of Russia and Siberia. Blocks of granite pudding-stone are scattered over many districts. The forests abound in fine timber, and contain a great q tity of wild animals, such as elks, wild hogs, bears, w foxes, &c. An animal peculiar to Lithuania is the u or bison, which was formerly found in many forests land and Germany, but is now confined to a single s Lithuania, called the forest of Biala Vieja. [BISON.] T climate is extremely cold in winter, and very hot in s mer. There are scarcely any manufactures in the cou and its exports consist chiefly of flax, hemp, corn, tim honey, and wax.

The principal rivers which water Lithuania ar Niemen (in German, Memel), the Dnieper, Berezina, V &c. The chief towns are Vilna, its antient capital, Gr Minsk, Mohilew, Vitepsk, &c.

It has been mentioned that the Lithuanians rem idolaters till the end of the fourteenth century. Their deity was Perkunas, or the god of thunder, besides other divinities presiding over seasons, elements, and p cular occupations, as was the case in almost all the i trous creeds of antient Europe. They possessed also groves and fountains, and worshipped the fire and c crated snakes. Some learned disquisitions have written on the probable origin of the antient Lith worship; among others, Lasicius, or Lasitski, 'De Samogitorum,' in the collection of Elzevir, 'De Rep Polona.'

The population of Lithuania is composed of Lithua Lithuano-Russians, Poles, Jews, and Tartars. Th form a population of about 100,000 individuals, an descendants of a Tartar colony settled in Lithuania by the grand-duke Vitold, towards the end of the fourteenth century. They all profess the Mohammedan religion, but they are not distinguished in externals from the other inhabitants of the country. Those who are descended from the Tartar murzas, or nobles, were admitted into the ranks of the Polish nobility, and possessed all the privileges of that order, and they continue to possess them under the Russian government. They enjoy a high reputation for honesty, and are generally employed in various offices of trust.

---

[*] This Russian idiom is quite different from the Muscovite, or modern Russian. It is a dialect called generally that of White Russia, and it is now spoken by the population of the present governments of Vitepsk, Mohilew, and Smolensk. It has no literature except the statute or code of laws of Lithuania, published in the sixteenth century, and the official records of that country till the middle of the seventeenth century

[*] We have followed the data furnished by Hassell, 1823, and al Malte Brun in his 'General Geography,' and Schnitzler in his 'St Russia.'

We have already said that the origin of the Lithuanian nation is involved in obscurity, and that all the conjectures on this subject lead to no satisfactory conclusion. We have also alluded to the tradition about a Roman colony in Lithuania. Adelung and Vater define the Lithuanians to be a Germano-Slavic nation, and say that two-thirds of their language are Slavonian. Balbi, in his 'Ethnographical Atlas,' places the Lithuanian language among the Slavonian, and states, on the authority of Mr. Watson, that it is composed of four-sixths of Slavonian, of which two-sixths are derived from the Polish and two-sixths from the Russian languages, whilst the remaining two-sixths may be traced to the Finnish, Gothic, and German. The opinion however appears to us by no means a correct one. There can be no doubt that a great number of Slavonic words became mixed with the Lithuanian language, from the circumstance of the Russian and afterwards the Polish being the official languages of that country: it is also certain that the rule of the German knights introduced many German words into the Lithuanian language, but their number is by no means so large as to warrant the conclusion above mentioned. The recent researches of some distinguished German philologists, and particularly those of Bopp and Bohlen, have proved that the Lithuanian language is closely allied to the Sanscrit, and that all the words, except those of modern introduction which are derived from the Latin, Germanic, and Slavonian languages, are so related to Sanscrit roots, in common with those above-mentioned languages, as to prove only that the Lithuanian language has a common origin with them, but not that it is derived from them. Professor Bohlen, of Königsberg, an eminent Sanscrit scholar, who is intimately acquainted with the Lithuanian language, thinks that it bears a stronger resemblance to the Sanscrit than to any other known language. The Lithuanian language may be divided into two principal dialects, the Lithuanian Proper, and the Lettonian, or Livonian, both of which may be subdivided into smaller ones. The Lithuanian Proper contains the following dialects:—1st, the old Prussian, which had been spoken in Prussia previously to the arrival of the Knights of St. John of Jerusalem, who tried by all means to extirpate it. Notwithstanding this unfavourable circumstance, it was still in general use at the time of the Reformation; but in spite of the support it derived from the Protestant authorities, it dwindled away, so that according to Hartknoch, who wrote towards the end of the seventeenth century, there were at that time only a few old people who understood it, and it is now entirely extinct as a living language. It differs from other Lithuanian dialects in having a greater admixture of German than Slavonian words, which was owing to the influence of the German knights, who took possession of the country, and whose language finally superseded that of the native population.

Simon Gruner, a Dominican monk, translated in 1521 the Lord's Prayer into that language, and collected a small vocabulary of eighty-nine words. Albert, duke of Prussia, a zealous propagator of the Reformation, ordered a catechism to be composed in that language, which was published at Königsberg, 1545. The authors of this catechism, wishing to make it intelligible to all the inhabitants of Prussia, used in its composition promiscuously all the local dialects into which this language is subdivided: the result of such an absurd plan was, that it became unintelligible to all. It was therefore remodelled, and the dialect of Samland, as being the most widely spread, was adopted. This catechism, as well as the Enchiridion, or church service (Königsberg, 1561), are the only extant monuments of that old language.

2. The Prusso-Lithuanian dialect, which is now spoken about Insterburg and Memel, is the nearest to the old Prussian, but it has received a great admixture of Polish words. A Bible, translated into that language by Quandt, was published at Königsberg, 1755, and many religious works in that same dialect are mentioned in its preface.

The Polish-Lithuanian, or Samogitian language, which is spoken in the north-western part of Lithuania, and particularly in the province of Samogitia, differs from the Prussian dialect in being more free from the admixture of German words, and it is certainly the purest of all the dialects, as the population by which it is spoken resisted the German invaders. The Russian language, which, as we have seen, became the official language of the country, from the fourteenth century, and the subsequent influence of the Polish, have introduced many words derived from both these languages. There is in that dialect a Protestant Bible translated by Chilinski, published at London in 1660, and many other works of a religious character.

The second principal dialect of the Lithuanian is the Lettonian, or the Livonian, which is sometimes called the Curonian. It is spoken in the greatest part of Livonia, in Courland, and a part of the government of Vitepsk, which was formerly called Polish Livonia. It differs from the other Lithuanian dialects in having an admixture of Finnish words, which is peculiar to this dialect. It is subdivided into several minor dialects, of which that which is spoken about Mittau and Riga is considered the best, and it has been used for the translation of the Bible, and for the composition of several religious works. There is at the University of Dorpat a chair of this language.

For a circumstantial account of the works published about the Lithuanian language, or composed in it, see *Mithridates*, by John Adelung, continued by Severin Vater, vol. ii., p. 696, &c., Berlin, 1809: as to its connexion with the Sanscrit, see Bopp's *Comparative Grammar*, and the article Language.

LITI'OPA, a genus of pectinibranchiate mollusks, established by M. Rang, with the following characters:—

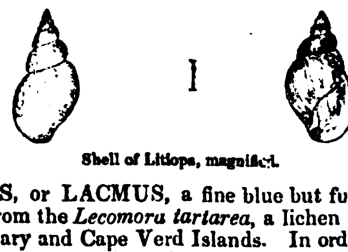
Animal transparent, spiral, furnished with a rather short and narrow *foot*, and a head provided with two elongated conical tentacles, with the eyes at their external base.

Shell not thick, horny, with a slight epidermis, slightly transparent; conoïd; the *whorls* of the spire rather rounded, the last whorl larger than all the others put together, the *apex* pointed and furrowed longitudinally; *aperture* oval, wider anteriorly than it is posteriorly, borders disunited, the right border or lip uniting itself to the left, without forming a very distinct notch, but only a deep 'contour,' in the place of one; left lip returning inwards (rentrant en dedans) so as to form a projection with the anterior extremity of the columella, which is rounded, arched, and a little truncated anteriorly. No *operculum*.

M. Rang places this form between *Janthina* and *Phasianella;* and observes that the habits of this pelagic mollusk are very curious. He states that he had many years ago observed the shell, but time had not permitted him to study the animal. M. Bellanger, captain in the French navy, was the first who recognised it, but that gentleman unfortunately had not studied its external organization; he observed however the singular fact that this animal, which lives upon floating plants, quits them sometimes, but holds itself fixed by a thread.* M. Rang dissected some specimens preserved in spirit of wine given to him by that officer, and detected some small glairy masses which appeared to M. Rang to be attached to the foot, and which were easily drawn out to considerable length. M. Rang looked in vain for an operculum, the absence of which establishes a great difference between this genus and *Phasianella*, and has described two species, different as regards the shell, but with apparently similar animals.

Geographical Distribution.—The ocean.

M. Rang observes that the genus *Litiopa*, like some others, proves that it is not possible to establish divisions founded on the presence or absence of an operculum.



Shell of Litiopa, magnified.

LITMUS, or LACMUS, a fine blue but fugitive colour prepared from the *Lecomoru tartarea*, a lichen which grows in the Canary and Cape Verd Islands. In order to extract the colouring matter the lichen is cleaned and reduced to powder; this is then mixed with urine and lime, and in a few days the blue colour is developed. The litmus is imported in small cubical cakes of dusky-blue colour, which are light and easily reducible to powder. The colouring matter, which is supposed to be *erythrin*, existing also in archil, is soluble both in water and spirit of wine, and is of a beautiful tint.

---

* See Limnæans, vol. xiii., p. 500.

Litmus is used as a chemical test for detecting the presence of acids, by which it is turned red, and the blue is restored by alkalis, so that when slightly reddened it may also be employed to detect alkalis. It is employed either as a tincture, or more commonly paper stained blue with it is used. The tincture is sometimes, but improperly, called tincture of turnsole, a name which was given to the colour in order to keep its true source a secret.

The blue colour of the litmus is evidently owing to the presence of an alkali, for when moistened litmus and turmeric paper are put into contact, the turmeric becomes brown, indicating the action of an alkali. To a certain extent therefore the alkali reduces the value and accuracy as a test of acids; it was nevertheless found by Mr. Watt that it detected the presence of sulphuric acid diluted with 100,000 times its weight of water.

By exposure to the sun's rays tincture of litmus becomes red even in close vessels; and there exists between its colouring matter and that of indigo a certain degree of analogy; both for example are capable of being deprived of oxygen, and when thus deoxidized lose their blue colour, which is restored by exposure to the air or other means of reoxidizement. The protosalts of iron also, which are well known to deoxidize indigo, produce the same effect upon litmus.

LITRE, the French standard measure of capacity in the metrical system. It is a cubic decimetre, or a cube whose sides are each 3·9371 English inches. It contains 61·0280 English cubic inches, for four litres and a half make, roughly speaking, an imperial GALLON. The litre is therefore a little less than our quart: more precisely, it is ·22009687 of a gallon.

LITTLETON, THOMAS, was the eldest son of Thomas Westcote, of the county of Devon, Esq., by Elizabeth, the daughter and sole heiress of Thomas Littleton, or Luttleton, Luttelton, or Lyttelton (the last being the mode in which he himself appears to have written it: see the extract from his will given below), of Frankley in Worcestershire, whose surname and arms he took. He was educated at one of the universities, and thence removed to the Inner Temple, where in due time he became one of the readers of that Society: Sir Edward Coke mentions his reading on the statute *Westm. 2, De donis conditionalibus*. He was appointed by Henry VI. steward or judge of the court of the palace or marshalsea of the king's household. On the 13th May, 1455, in the 33 Henry VI., he was made king's serjeant, and in that capacity rode the northern circuit as judge of assize. In 1454 he had a general pardon under the great seal,* and two years after was in commission, with Humphrey, duke of Buckingham, and William Birmingham, Esq., to raise forces in the county of Warwick. (Collins, *Peerage*, who gives as his reference, 'Pat. 36, Hen. 6, p. 1, m. 7.) In 1462 (2 Edward IV.) he received a general pardon from the crown, and was continued in his post as king's serjeant, and also as justice of assize for the same circuit. On the 26th April, 1466 (6 Edward IV.), Littleton was appointed one of the judges of the Court of Common Pleas, and rode the Northamptonshire circuit. About the same time he obtained a writ, directed to the commissioners of the customs for the ports of London, Bristol, and Kingston-upon-Hull, for the annual payment of 110 marks, to support his dignity, with 106*s.* 11½*d.* to furnish him with a furred robe, and 6*s.* 6*d* more for another robe, called *linura*. In the fifteenth year of the same he was created a knight of the order of the Bath. Sir Thomas Littleton married Joan, widow of Sir Philip Chetwin, of Ingestre, in the county of Stafford, one of the daughters and co-heiresses of William Burley, of Broomscroft Castle, in the county of Salop, Esq., with whom he had large possessions. By her he had three sons and two daughters. 1. William, ancestor of the Lords Lyttelton, barons of Frankley, in the county of Worcester. 2. Richard, to whom the 'Tenures' are addressed, an eminent lawyer in the reigns of Henry VII. and Henry VIII. 3. Thomas, from whom were descended the Lord-Keeper Lyttelton, baron of Mounslow, in the reign of Charles I., and Sir Thomas Lyttelton, Bart., Speaker of the House of Commons in the reign of William III. His two daughters, [illegible] Ellen and Alice, both died unmarried. (Collins's *Peerage*, vol. vii., p. 424.)

Littleton died at Frankley on the 23rd August, 1481, aged about sixty, and was buried in Worcester cathedral, where his tomb bore the following inscription:—'Hic jacet corpus Thome Littelton de Frankley, Militis de Balneo, et unus Justiciarorum de Communi Banco, qui obiit 23 Augusti, Ann. Dom. MCCCCLXXXI.'

In Collins's 'Peerage'. there is a copy of Sir Thomas Littleton's will, 'faithfully copied from the original remaining in the Prerogative Office.' It contains some curious particulars; but we can only make room for the following extract from its commencement:—

'In the name of God, Amen. I, Thomas Lyttelton, Knight, oon of King's justice of the common place, make my testament, and notifie my wille, in the manner and [illegible] that followeth. First, I bequeth my soul to Almighty God, Fader, Soune, and Hollye Ghost, three Persons and [illegible] God, and our Lorde, maker of heven and erth, and of [illegible] the worlde; and to our most blessed Lady and Virgin Saynt Mary, moder of our Lord and Jesu Christ, the [illegible] begotten Sonne of our saide Lorde God, the Fader [illegible] heven, and to Saint Christopher, the which our saide Lorde did truste to bere on his shouldres, and to all the [illegible] heven; and my body to be berried in the tombe I lete make for me on the south side of the body of the cathedral church of the monastere of our said blessed lady of Worcester, under an image of St. Christopher, in caas if I die in Worcestershire. Also, I wulle, and specially desire, that immediately after my decesse, myn executors finde [illegible] gode preests for to singe jjj trentals for my soule, so [illegible] everich preest, by himself, sing oon trental, and that every such preest have right sufficiently for his labor; also, that myn executors finde another gode preest for to singe for [illegible] soule fyve masses,' &c. He then makes a provision for two younger sons, willing that the 'feoffees to myn use' and in certain manors and lordships should 'make [illegible] estates' unto his sons Richard and Thomas Lyttelton.

He appointed his three sons and 'Sir Xtopher Goldsmith, parson of Bromsgrove, Sir Robert Cank, parson of En[illegible] and Robert Oxclyve,' to be his executors. The will is dated at Frankley, 22nd August, 1481, being, as appears from the date of his death on his monument already quoted, the [illegible] preceding that of his death.

Sir Edward Coke has given it as his opinion that Littleton compiled his book of 'Tenures' when he was judge, after the reign of King Edward IV., but that it was not printed during his life; that the first impression was at Rouen, in France, by William de Taillier, *ad instantiam Rich. Pinson*, the printer of Henry VIII., and that it was printed about the twenty-fourth year of the reign of Henry VIII. In a note to the eleventh edition of Sir Edward Coke's 'Commentary,' it is remarked that this opinion is erroneous, because it appeared by two copies in the bookseller's custody that the 'Tenures' were printed twice in London in the year 1528, once by Richard Pinson, and again by Robert Redmayne, and that was the nineteenth year of the reign of Henry VIII. It is observed that, to determine with certainty when the Rohan or Rouen edition was published, is almost impossible; but that from the old editions above mentioned it may be collected, not only that the Rohan impression is older than the year 1528, but also, from what occurs in the beginning and end of them, that there had been other impressions of the book in question. However, it appears impossible, at this distance of time, to settle with accuracy when the first edition of Littleton's work was printed.

Littleton's work on English tenures is written in Norman French, divided into three books, and addressed to his son, [illegible] whose use it was probably intended. He says himself [illegible] Tabula, in a note following the list of chapters in the first books—'And these two little books I have made to [illegible] for the better understanding of certain chapters of the [illegible] tient Book of Tenures."' And after the Table of Contents of book iii. he thus concludes:—

'EPILOGUS.

'And know, my son, that I would not have thee believe that all which I have said in these books is law, for I will not presume to take this upon me. But of those things which are not law inquire and learn of my wise masters le[illegible] in the law. Notwithstanding, albeit that certain things which are moved and specified in the said books are not altogether law, yet such things shall make thee more apt and able to understand and apprehend the arguments and the reasons of the law, &c. For by the arguments and reasons in the law a man more sooner shall come to the certainty and knowledge of the law.

---

* Collins's 'Peerage,' vol. vii., p. 423, who cites as his authority for this, 'Autographus penes Honoratissimum Dom. Dom Geo. Lyttelton, Baronem de Frankley

'*Lex plus laudatur quando ratione probatur.*'

The circumstance above referred to of this treatise having been originally but a sort of introductory lesson 'for the better understanding of certain chapters of the "Antient Book of Tenures"' may in part account for what has been often remarked respecting its defect in the accurate division and logical arrangement of the subject matter. The style however in which it is written is remarkably good. It combines the qualities of clearness, plainness, and brevity, in a degree that is not only extraordinary for the rude age in which the author wrote, but renders him superior, as to purity of style, to any writer on English law who has succeeded him. It is equally free from the barbarous pedantry and quaintness of Coke, and from the occasionally somewhat rhetorical manner of Blackstone.

Littleton very seldom quotes any authority for what he advances: indeed, it was not the practice of the lawyers of his age to cite many authorities, even in arguments and opinions delivered in court. Littleton is a fair, or rather a favourable specimen of the mode in which the English lawyers, often with great acuteness and consistency, followed out all the consequences that might be logically deduced from certain principles or maxims, some of which maxims or premises being irrational and absurd, necessarily led to irrational and absurd conclusions. What with the alterations in and additions to the law since Littleton wrote, there is much of Littleton's book that is not now law; but from the absolute necessity of a knowledge of what was the state of the law with respect to property in land, in order to understand thoroughly what it now is, Littleton is still an indispensable book to the student of English law. But we are inclined to be of the following opinion given in Roger North's 'Life of the Lord-Keeper Guilford:'—'Coke's comment upon Littleton ought not to be read by students, to whom it is at least unprofitable; for it is but a common-place (book), and much more obscure than the bare text without it. And, to say truth, that text needs it not; for it is so plain of itself, that a comment, properly so called, doth but obscure it.' (vol. i., p. 21.) Coke's 'Commentary on Littleton' was no other than a sort of common-place book kept by Coke as a manual, in which he jotted down all his law and references to law as they occurred.

To put this Commentary, or rather common-place book, into a student's hands to read as an institutional or elementary book is evidently futile; and the doing so is probably the cause why so many students of English law break down at the very threshold of their career. The effect is, as North, or rather the Lord-Keeper Guilford, observed, 'like reading over a dictionary, which never teacheth a language;' and therefore with him we may conclude that 'certainly it is an error for a student to peruse such.' (North's *Life of Lord-Keeper Guilford*, vol. i., p. 21.) It is much better for the student who wishes to lay well the foundations of his professional knowledge to read Littleton without the comment (which of course he will find useful afterwards, when he wishes to examine any particular point very minutely); but then he must read slowly and carefully, and a little at a time; in short, very much as he would read Euclid, if he wishes to master it.

(The authorities used in this article are chiefly Coke's Preface to his *Commentary on Littleton*; the article 'Littleton, Thomas,' in the *Biographia Britannica*; Butler's Preface to the thirteenth edition of Sir Edward Coke's *Commentary*; and Collins's *Peerage*, vol. vii., article 'Lord Lyttelton.')

LITTORI'NA. [TURBINIDÆ.]

LITUITES, a group of fossil cephalopoda, confined to the strata of the Silurian and older systems. The shell is partly straight and partly convoluted, nearly as in spirula. *Lam.*

LITURGY (from the Greek λειτουργία, which originally signified at Athens 'certain public functions or duties to which the citizens were personally liable') is a form of public devotion, and more particularly the Office of Common Prayer used in our own or any other church. In the Greek or Constantinopolitan church three Liturgies are in use, those of Basil, Chrysostom, and the Liturgy of the Presanctified. In the Romish church the Liturgy is divided into several books or offices, as the breviary, the ceremoniale, or office peculiar to the pope; the missal, or office of the mass; the pontificale, directing the functions of the bishops, and the rituale, or pastorale, for the guidance of the simple priests. The Spanish is better known by the name of the Mozarabic Liturgy. The Ambrosian Liturgy is that more particularly in use in the church of Milan. In France the church of St. Martin at Tours had a breviary of its own, which was neither the Roman nor that of Tours; and the same difference obtained at St. Quintin and in other Gallican churches.

At the Reformation all the Protestant churches on the Continent, without a single exception, introduced Liturgies for the more uniform celebration of divine service.

Previous to the Reformation of the Church of England the service was performed in Latin, and different Liturgies were used with us, also, in different parts of the kingdom. The cathedrals of York, Lincoln, Hereford, and Bangor, and even Aberdeen in Scotland, had their respective uses; but no cathedral had such a variety of service books for its use as Sarum. 'Use' was another name for the Ordinale, or complete service of the church of Salisbury, instituted by bishop Osmund in 1077. It was also named the Consuetudinary; and in Knighton's and Higden's time it obtained almost all over England, Wales, and Ireland. The whole province of Canterbury adopted it, and in right of it the bishop of Salisbury was precentor in the college of bishops whenever the archbishop of Canterbury performed divine service. (Lyndwood, *Provinc. de feriis c. ult.*)

The publication of king Henry the Eighth's 'Primer' in 1535, in the vernacular tongue, was one of the first steps in the reformation of doctrine and worship in the Church of England. It was followed in 1537 by 'The Godly and Pious Institution of a Christian Man,' containing a declaration of the Lord's Prayer, the Ave Maria, the Creed, the Ten Commandments, the Seven Sacraments, &c., republished with corrections and alterations in 1540 and 1543. In 1545 a second 'Primer' came out; and in 1547, 1st Edward VI., archbishop Cranmer, bishop Ridley, with eleven other bishops and eminent divines, were commissioned by the king in council to compile a Liturgy in the English language free from the erroneous doctrines by which the Latin Liturgies of the church, while unreformed, had been distinguished. This was confirmed by parliament in 1548, and published in 1549. In 1551 it was slightly revised, and again confirmed in parliament; but both this and the former act of 1548 were repealed on the 1st of Mary, as not agreeable to the principles of the Romish Church, which she was about to restore. Upon the accession of Elizabeth the act of repeal was reversed; several learned divines, headed by archbishop Parker, were appointed to make another review of King Edward's Liturgies, when the restoration of the second book of King Edward the Sixth was determined upon, and finally confirmed by parliament. The act received the royal assent April 29th, 1559. In the 1st of James I., after the conference at Hampton Court between that prince with archbishop Whitgift and other bishops and divines on one side, and Dr. Reynolds, with some other puritans, on the other, a few slight alterations were introduced, the chief of which consisted in adding some forms of Thanksgiving at the end of the Litany, and an addition to the Catechism concerning the sacraments; and in the rubric in the beginning of the office for private baptism the words 'lawful minister' were inserted to prevent midwives or laymen from presuming to baptize. In this state it continued till the time of Charles II., who, in 1661, issued a commission to empower twelve bishops and as many Presbyterian divines to consider of the objections raised against the Liturgy, and to make such reasonable and necessary alterations as they should jointly agree upon; nine assistants on each side being added to supply the place of any of the twelve principals who should happen to be absent. On the episcopal side were Dr. Frewen, archbishop of York, Dr. Sheldon, bishop of London, Dr. Cosin, bishop of Durham, Dr. Warner, bishop of Chichester, Dr. Henchman, bishop of Salisbury, Dr. Morley, bishop of Worcester, Dr. Sanderson, bishop of Lincoln, Dr. Laney, bishop of Peterborough, Dr. Walton, bishop of Chester, Dr. Stern, bishop of Carlisle, and Dr. Gauden, bishop of Exeter. On the

Presbyterian side were Dr. Reynolds, bishop of Norwich, Dr. Tuckney, Dr. Conant, Dr. Spurstow, Dr. Wallis, Dr. Manton, Mr. Calamy, Mr. Baxter, Mr. Jackson, Mr. Case, Mr. Clark, Mr. Newcomen. The coadjutors on the Episcopal side were Dr. Earles, dean of Westminster, Dr. Heylin, Dr. Hackett, Dr. Barwick, Dr. Gunning, Dr. Pearson, Dr. Pierce, Dr. Sparrow, and Mr. Thorndike. Those on the Presbyterian side, Dr. Horton, Dr. Jacomb, Mr. Bates, Mr. Rawlinson, Mr. Cooper, Dr. Lightfoot, Dr. Colins, Dr. Woodbridge, Mr. Drake. These commissioners held several meetings at the Savoy, but to little purpose. The king's commission gave them no further power than to 'compare the Common-Prayer Book with the most antient Liturgies that had been used in the church in the most primitive and purest times:' and required them 'to avoid as much as possible all unnecessary alterations of the forms and Liturgy wherewith the people were altogether acquainted, and had so long received in the Church of England.' The Presbyterians however would not allow that the Liturgy was capable of amendment, and Baxter had prepared and offered one of his own to be substituted in its room. The Conference at length broke up without anything being done, except that some particular alterations were proposed by the Episcopal divines, which in the May following were considered and agreed to by the whole clergy in convocation. The principal of them were, that several lessons in the Calendar were changed for others more proper for the days; the prayers for particular occasions were disjoined from the Liturgy, and the two prayers to be used in the Ember-week, the prayer for the parliament, that for all conditions of men, and the general Thanksgiving were added; several of the Collects were altered; the Epistles and Gospels were taken out of the last translation of the Bible, being read before according to the old translation; the office for baptism of those of riper years, and the Forms of Prayer to be used at Sea, were added. In a word, the whole Liturgy was then brought to that state in which it now stands; and was unanimously subscribed by both houses of convocation of both provinces on Friday, 20th of December, 1661; and being brought to the House of Lords the March following, both Houses passed an act for its establishment; and the earl of Clarendon, then lord chancellor, was ordered to return the thanks of the lords to the bishops and clergy of both provinces for the great care and industry shown in the review of it.

(Wheatly's *Illustr. of the Book of Common Prayer*, 8vo., Oxford, 1794, p. 20-25; Shepherd's *Critical and Practical Elucidation of the Morn. and Even. Prayer of the Ch. of Engl.*, 8vo., Lond., 1798, Introd., p. xxxv.-lxxviii.; Gough's *Brit. Top.*, ii. 319-361, &c.)

Among what are called the Additional Manuscripts in the British Museum is 'An Apparatus of Materials,' in forty-five volumes, being a collection of notes and observations on the Liturgy, and various other subjects connected with the offices of the church, by a clergyman of the Church of England, who directed them to be deposited in that institution, but that his name should remain unknown. These volumes were deposited in the British Museum in 1791.

LITUUS, a name given to a spiral thus described:— Let a variable circular sector always have its centre at one fixed point, and one of its terminal radii in a given direction. Let the area of the sector always remain the same: then the extremity of the other terminal radius describes the lituus. The polar equation of this spiral is $r^2\theta = a$.

LITUUS, a crooked staff resembling a crozier, used by the augurs among the antient Romans in making their observations on the heavens, hence called the *Augural lituus*. Dr. E. D. Clarke asserts that there was an older lituus, called the *Regal or Quirinal lituus*, which the antient kings of Italy bore as a sceptre in their hands long before the time of Romulus or the institution of the Augurate, particularly mentioned by Donatus and Servius in their Commentaries upon Virgil. The etymology of the name is uncertain.

(Pitisci *Lexicon*, in voce; Clarke's 'Observations on the Lituus of the Antient Romans,' in the *Archæologia*, vol. xix, p. 386-404.)

LIUTPRANDUS, or **LUITPRANDUS**, was a deacon at Pavia in the year 946, when Berengarius, marquis of Ivrea and regent of the kingdom of Italy, sent him as his ambassador to Constantinople, where he learned the Greek language. After his return he was made bishop of Cremona. Otho I., emperor and king of Italy, sent him in 963 on a mission to Pope John XII.; and in the following year Luitprand accompanied Otho to the council held at Rome, which deposed John and chose Leo VIII. in his place. On that occasion Luitprand spoke to the council in the name of the emperor, who did not understand Latin, as he says in his Chronicle. In 965 Otho sent him as ambassador to Nicephorus Phocas, emperor or usurper of Constantinople, who treated him very scurvily, and kept him as a kind of prisoner. After four months' residence in that capital Luitprand left Constantinople in the month of October to return to Italy. He died not long after at Cremona, but the precise year of his death is not ascertained.

He was a man of considerable learning for his age, and his works are valuable for the historical information which they contain. They consist, 1, of a general history of Europe from the year 862 to the year 964, 'Rerum Gestarum ab Europæ Imperatoribus et Regibus, libri vi.' Luitprand gives among other things an account of the court of Constantinople at the time of his first mission, and of Basilius and his son Leo the philosopher. The work concludes with the council of Rome and the trial and deposition of John XII. 2. 'Legatio Luitprandi Cremonensis Episcopi ad Nicephorum Phocam.' This is a narrative of his second embassy to Constantinople, in which he describes Phocas in no very flattering colours. The work is very curious. Another work has been attributed to Luitprand, namely, 'De Pontificum Romanorum Vitis,' but his authorship of it is very doubtful. The best edition of the works of Luitprand is that of Antwerp, 1640, 'Luitprandi Opera quæ extant,' with very copious notes, by Jerome de la Higuera and L. Ramirez de Prado, with a dissertation at the end on the Diptychon Toletanum.

LIVA'DIA. [Bœotia.]

LIVE STOCK. The animals necessary for the stocking and cultivation of a farm, and those which are kept on it for profit, or for the sake of their dung, are called the live stock of the farm, in contradistinction to the dead stock, which consists of the implements of husbandry and the produce stored up for use.

The live stock on a farm must vary according to circumstances. The number of horses or oxen kept for the cultivation of the land and other farming operations should be exactly proportioned to the work to be done. If they are too few, none of the operations will be performed in their proper time, and the crops will suffer in consequence. If there are too many, the surplus beyond what is strictly required is maintained out of the profits of the farm. To have the exact number of animals which will give the greatest profit is one of the most important problems which a farmer has to solve: what may be very profitable in one case may be the reverse in another; and, as a general maxim, it may be laid down, that the fewer mouths he has to feed, unless they produce an evident profit, the less loss he is likely to incur. But this rule admits of many exceptions. It is of great importance, in taking a farm, to calculate the extent of the arable land, so that it can be properly cultivated by a certain number of pairs of horses or oxen. It is an old measure of land to divide it into so many ploughs, that is, so many portions which can be tilled with one plough each. When there are several of these, it is useful to have an odd horse over the usual number required for two or three ploughs, to relieve the others occasionally. The work is thus done more regularly and with greater ease. Where there are two ploughs with two horses each, a fifth horse should be kept, and so in proportion for a greater number. The odd horse will always be found extremely useful, if not indispensable, and the expense of his keep will be amply repaid by the regularity and ease with which the whole work of the farm will be done, and the relief which occasional rest will give to the other horses.

The other part of the live stock kept on a farm must depend on various circumstances. Where there is good grazing land, the profit on the improvement of the live stock, or their produce, is evident and easily ascertained. But where animals are kept upon artificial food or fatted in stalls, it is often a difficult question to answer, whether there is a profit on their keep or not. In most cases the manure which their dung and litter afford is the chief object for which they are kept. If manure could be obtained in sufficient quantities to recruit the land, at a reasonable price.

it might often be more advantageous to sell off all the hay and straw of a farm, and to keep only the cattle necessary to till the ground or supply the farmer's family. But this can only be the case in the immediate neighbourhood of large towns. In the country at a greater distance no manure can be purchased; it must consequently be produced on the farm; and for this purpose live stock must be kept, even at a loss. The management and feeding of live stock is therefore an important part of husbandry. The object of the farmer is principally to obtain manure for his land, and if he can do this, and at the same time gain something on the stock by which it is obtained, he greatly increases his profits. Hence much more skill has been displayed in the selection of profitable stock than in the improvement of tillage. Some men have made great profits by improving the breed of cattle and sheep, by selecting the animals which will fatten most readily, and by feeding them economically. It requires much experience and nice calculations to ascertain what stock is most profitable on different kinds of land and in various situations. Unless very minute accounts be kept, the result can never be exactly known. It is not always the beast which brings most money in the market that has been most profitable; and many an animal which has been praised and admired has caused a heavy loss to the feeder. Unless a man breeds the animals which are to be fatted, he must frequently buy and sell; and an accurate knowledge of the qualities of live stock and their value, both lean and fat, is indispensable. However honest may be the salesman he may employ, he cannot expect him to feel the same interest in a purchase or sale, for which he is paid his commission, as the person whose profit or loss depends on a judicious selection and a good bargain. Every farmer therefore should endeavour to acquire a thorough knowledge of stock, and carefully attend all markets within his reach to watch the fluctuation in the prices. It will generally be found that the principal profit in feeding stock is the manure, and to this the greatest attention should be directed. A little management will often greatly increase both the quantity and quality of this indispensable substance, and make all the difference between a loss and a profit in the keeping of stock. [MANURE.]

LIVER. The liver is the secreting organ or gland by which the bile is formed. Its existence has been traced very low in the scale of animals; and parts supposed to have an analogous function have been found in insects, but their nature is at present a disputed question. The differences in regard to size, form, and colour, which the liver presents in the higher animals (mammalia, birds, reptiles, amphibia, and fishes), are of no great importance.

In man the liver is a large solid viscus, of a reddish brown or mottled red and yellow colour, situated immediately beneath the diaphragm, in the right hypochondriac and partly in the epigastric region of the abdomen. [ABDOMEN.] When enlarged, it can be felt by the hand applied below the ribs on the right side. It is flattened in the vertical direction, is thinner at its anterior than at its posterior border, and its outline, when viewed from above, is irregularly ovoid. The upper surface, which is convex, is applied to the diaphragm; the lower, which is irregularly concave, lies above and in contact with the stomach, large intestine, and right kidney, has attached to it the gall-bladder, and presents two deep furrows, which divide it into several compartments, termed by anatomists lobes. Of the furrows, one running from before backwards (the longitudinal fissure) transmitted, during uterine life, the vessel which conveyed the blood from the placenta to the heart of the fœtus; it afterwards contains merely the cord-like remains of that vessel, now impervious in the greater part of its extent. The second furrow, in the under surface of the liver, is called the transverse fissure, since it crosses the former at right angles, lying however chiefly to its right side; it serves to allow the entrance of blood-vessels and nerves to the liver and the exit of the bile-ducts. Like other viscera of the abdomen, the liver receives an investment from the lining membrane of that cavity, the peritoneum, which, being reflected from it at different points, forms broad bands connecting the liver with surrounding parts.

The substance of glands generally is constituted of minute ramified or convoluted canals, closed at their radicle extremity, and communicating only with the principal duct, by which the secretion is conveyed away, and of a great number of blood-vessels which surround the above-mentioned canals in their whole extent, and afford the component matters of the secretion; these matters find their way into the interior of the glandular canals, not by distinct openings from the blood-vessels, but by transudation through their walls. In the human subject all other glands than the liver receive one kind of blood only, namely, arterial blood, from which the components of the secretion are derived, and the organ at the same time nourished, and the only veins are those which convey away the same blood after it is rendered venous by the changes it undergoes in the gland. But the liver, like the lungs in man and the kidneys also in some animals, receives two kinds of blood—arterial blood in small quantity, destined principally for the nourishment of the gland, and venous blood in much larger quantity, from which the bile is principally formed. The vessel which brings the arterial blood, the hepatic artery, is small, and comes off the aorta [AORTA], together with the arteries supplying the stomach, spleen, duodenum, and omentum. The venous blood is brought by the portal vein, a large vessel resulting from the union of all the veins returning the blood from the spleen, omentum, pancreas, and gall-bladder, and from the viscera directly engaged in the function of digestion, namely, the stomach and intestines. The hepatic artery and portal vein enter the liver at the transverse fissure or furrow of its inferior surface, where the bile-duct issues, and ramify together with the branches of that duct through the substance of the organ. After the materials for the nutrition of the liver itself, and for the secretion of the bile, have been derived from the blood of the two sets of vessels already mentioned, it is returned to the general circulation by a third set, the hepatic veins, which issue from the liver at its posterior border, and immediately enter the inferior vena cava near the heart.

The ultimate arrangement of these different blood-vessels in the liver is very peculiar: it was discovered a few years since by Mr. Kiernan. When the substance of the liver is torn, it is seen to be composed of innumerable granules of about the size of a pin's head; each of these contains the elements of a liver. They are connected most intimately with the branches of the hepatic vein, a small twig of which is contained in the interior of each, while on their exterior surface and in their interstices run branches of the portal vein, hepatic artery, and bile-duct. The mass of each granule or lobule is constituted in great part of a close net-work of capillary blood-vessels, which communicate on the exterior with the small branches of the portal, and on the interior with the twig of the hepatic vein. The blood brought by the portal vein therefore is poured into the capillary net-work of each granule or lobule of the liver, and after yielding in it the constituents of the bile, is received into the branches of the hepatic vein, whence it is transmitted to the general vascular system. The branches of the hepatic artery soon become very minute on the exterior of the lobules, and few can be traced into their interior; it is probable that, after having nourished the coats of the vessels and ducts, and other tissues of the liver, the blood of the hepatic artery is poured into the minute net-work formed by the ultimate division of the portal vein, and contributes with the blood of that vein to yield the constituents of the bile.

The form and disposition, in the liver, of the primitive radicles of the secreting canals or bile-ducts, have not been determined. In all other known glands the radicles of the ducts commence by isolated closed extremities; but this has not been demonstrated in the case of the liver, and some anatomists have imagined that the ducts arise by a net-work or reticular plexus in the interior of each hepatic lobule or granule: however this may be, we must suppose that they penetrate into the interior of the lobules, so as to be brought into contact with the delicate reticular terminations of the portal vein, in order to receive the components of the bile; and the yellow colour of these lobules, when not much congested with blood, is most probably owing to the presence of minute biliary canals filled with their secretion.

The biliary canals reduced in number by successive reunion to two tubes, one from the right, the other from the left lobe of the liver, issue at the transverse fissure of its under surface, there soon unite, and form one main trunk, the hepatic duct. After running a short distance together with the portal vein, hepatic artery, and nerves, in a quantity of dense cellular tissue enclosed within the fold of the peritoneum that connects the liver with the stomach, the lesser omentum [PERITONEUM], the hepatic duct meets and unites with the duct of the gall-bladder, or cystic duct. The tube resulting from the junction of the hepatic with the cystic duct is called the ductus communis choledochus: it is about three and a half inches in length, and terminates by opening, together with the duct of the pancreas, into the portion of the intestine named duodenum, at the distance of a few inches from the stomach.

The gall-bladder is a pyriform membranous sac, lodged in a shallow depression at the inferior surface of the liver, which communicates, as we have stated, with the excretory duct of the liver, by means of a tube called the cystic duct. At times, when a supply of bile is not required in the intestinal canal—for instance, during fasting—the bile flowing from the liver is impeded in its progress through the ductus communis choledochus into the intestine, and is consequently obliged to regurgitate through the cystic duct into the gall-bladder, which serves as a temporary reservoir for the secretion, discharging it again when the presence of bile is required in the intestine to aid the digestive process. At the neck of the gall-bladder, close to its termination in the cystic duct, the lining membrane forms a spiral fold, which seems destined to retard the flow of the bile from the reservoir. The gall-bladder is not constantly present; the animals in which it does not exist are for the most part, though not universally, herbivorous, and such in which digestion is constantly going on, and a reservoir for bile consequently not required. But many herbivorous animals have a gall-bladder; and sometimes where it is absent the bile-duct presents a considerable dilatation of its cavity near the intestine: such is the case, for example, in the horse and elephant.

The *function of the liver* is manifold and important. The analysis of the fluid which it secretes shows that it frees the blood from an excess of matters composed of carbon and hydrogen; and by this means, and probably also by effecting some change in the matters which have been added to the blood during its circulation through the viscera of the abdomen, the liver assists in preparing that fluid for the nutrition of the body. The bile seems also to have a direct influence in the formation of the chyle, the nutritive fluid derived from the food; and some of its ingredients, serve as a natural stimulus of the peristaltic action of the intestines. [BILE.]

Development of the Liver. The liver, like other glands, is developed in the embryo as a diverticulum, or small sac protruded from the intestinal canal. The walls of this diverticulum become thickened, and in them are formed the secreting canals and other component parts of the organ, while its neck becomes narrowed and lengthened, and forms the excretory duct. Subsequently the gall-bladder is in its turn developed as a diverticulum from this duct.

LIVER, DISEASES OF. The liver is subject to all those general morbid changes which, depending on disordered actions of the blood-vessels, modification of the nutritive process, or alterations in the blood itself, may affect most organized parts of the body; such are inflammation (hepatitis), acute and chronic; hypertrophy and atrophy; induration and softening; and the different kind of tumours or transformations of tissue, carcinoma, or cancer, medullary sarcoma, fungus hæmatodes, melanosis, and scrofulous tubercle. It is occasionally infested by parasitic animals (hydatids), which may likewise affect other parts of the body.

But the liver is also liable to other diseases which appertain to it specially, and are connected with its function—secretion. The chemical changes which give rise to the formation of bile in the liver may be so deranged, that one or all of the ingredients of that fluid are increased or diminished in quantity, or vitiated in quality, and such disorder of the secreting process may manifest itself in several ways: the imperfectly formed fluid passing into the intestines may cause irritation there, and consequently diarrhœa; or being absorbed into the blood may produce jaundice and its concomitant symptoms; or some of the ingredients of the bile may concrete into solid masses in the ducts of the liver or the gall-bladder, forming gallstones. The diseased state of the liver in which it becomes impregnated with an unnatural quantity of fatty matter may also be reckoned among the diseases appertaining to the special function of the organ, for the bile naturally contains a large proportion of fatty matter (cholesterine); though the chemical composition of this substance, and that of the oil or fat with which the liver is impregnated in disease, appears to be different.

Acute hepatitis, when it exists in a severe degree, is indicated pretty distinctly not only by the general signs of inflammation and symptomatic fever, such as thirst, heat, and dryness of the skin, increased rapidity of the pulse, &c., but also by local symptoms, which point more especially to the seat of the disease, namely, pain and tenderness on pressure beneath the ribs on the right side, difficult breathing from the liver being pressed upon by the diaphragm when air is drawn into the lungs, and a short dry cough, dependent either on the extension of the inflammation to the diaphragm, or a sympathetic affection of the parts engaged in respiration. The pain in hepatitis so frequently extends to the right shoulder, that pain in that situation has been considered characteristic of disease of the liver. Vomiting is a common attendant on hepatitis, as on inflammation of most of the abdominal viscera. Another symptom is jaundice, which in this case is a consequence of the inflammatory action having disturbed the process by which the components of the bile are formed and separated from the blood.

Inflammation of the liver may terminate in suppuration, and the formation of one or more abscesses, which sometimes attain a very large size in this organ, protrude externally, and even burst and discharge their contents through an opening in the skin.

Acute inflammation may be produced in the liver by any of the influences which give rise to it in other organs: but while the lungs are more subject to this affection in cold climates, the liver is especially liable to it in hot countries. The cause of this difference is not at present known; the mere heat of the atmosphere however, or some circumstances connected with it, seem to be influential, since even in our own climate hepatitis, and the disorders of the secreting action of the liver, which give rise to diarrhœa, are particularly frequent in the hot season of the year.

Chronic hepatitis is indicated by the presence, in a less violent degree, of many of the symptoms which attend the acute disease. Thus, a dull pain or sense of weight in the right side, with some degree of tenderness in the same situation, pain in the right shoulder, slight jaundice or sallowness of the skin, and disorder of the stomach and digestive organs generally, are the most constant signs. It is frequently difficult to distinguish mere chronic inflammation of the liver without enlargement from some disordered states of the stomach and bowels, which sympathize so much with it, and hence has arisen the popular error of designating any chronic disorder of the digestive organs 'a liver complaint.' We cannot be surprised at this sympathy between the liver, stomach, and bowels, and other viscera of the abdomen in disease, since we know that they are all engaged in one great function—digestion; and are in the healthy state associated together in their action by a natural sympathy for the purpose of co-operation in that function.

The liver is very apt to become enlarged by chronic inflammation, and then can be felt externally. Or such changes may be produced in it by hypertrophy or atrophy of one or more of the tissues composing it, or by the formation of a new tissue, that the passage of the blood through it is impeded, and dropsy of the abdomen (ascites) is the result; this effect however is sometimes a consequence of the chronic inflammation of the liver having extended to the whole lining membrane of the abdominal cavity.

Of the structural diseases, not inflammatory in their nature, some, as scrofulous tubercles, are rarely met with the liver, others, as carcinoma, are more frequent in it than in most other internal organs, except the intestinal canal. There are no certain means of ascertaining the presence of these diseases in the liver, until the tumours which they form attain such a size as to be felt externally; though it should be suspected, when the general states of the body marking the carcinomatous and tubercular diathesis exist, and still more when these diseases are known to be present in other parts, if at the same time there are marks of irritation and disturbed action of the liver.

The 'fatty liver' is a frequent attendant on pulmonary phthisis: it cannot be recognised by any signs during life. The liver in man, as in many animals, particularly the sheep;

is, as we have said, subject to become the seat of parasitic living creatures—hydatids. These are generally contained in great numbers in a firm general cyst, which not uncommonly protrudes externally, and bursts, or is opened by a lancet, when numerous pellucid bladder-like bodies of different sizes, floating in a transparent fluid, escape.

The nature of the changes to which the secreting action of the liver is prone is but little understood; a further consideration of these changes would be misplaced here.

The *treatment* of diseases of the liver is regulated by the general principles according to which the cure of disease in other parts is attempted, and will of course vary with the nature of the particular affection requiring it.

LIVERPOOL, a municipal and parliamentary borough and seaport of Lancashire, stands on the right or east side of the estuary of the Mersey, in 53° 24′ N. lat. and 2° 58′ W. long. The etymology of the name Liverpool is, according to the popular belief, derived from the name of a bird called a liver or lever, which was said to frequent the site of the town, great part of which was formerly a marshy pool, which was filled and emptied with the flowing and ebbing of the tide. In conformity with this popular tradition, the corporate seal of the town bears the figure of a bird, which however, as there represented, is of a species wholly unknown at the present day, if indeed, as is much doubted, such a bird ever existed. The name of the town has also been derived, and with at least an equal appearance of probability, from the Welsh words Llër pwll, signifying 'place on the pool,' and it is certain that anciently the whole of the estuary of the Mersey, as far up as Runcorn, was called Lyrpul, Lyrpoole, or Litherpool. In confirmation of this etymology, it may be observed that the name of Liverpool is pronounced 'Lerpool' by many of the country people who live in the neighbourhood.

No mention is made of Liverpool in Domesday-book, though it contains the names of several places in the vicinity, and also the grant of all the parts between the Ribble and the Mersey to Roger of Poictiers, by whom it is said the castle of Liverpool was built. This was probably the origin of an English town and port which are now second in commercial importance to London only. An act was passed in 1659 for demolishing the castle of Liverpool, on the site of which St. George's church now stands.

In 1173 the town received its first charter from Henry II., a mark of royal favour occasioned by the importance of the place as a means of communication with Ireland. A second charter was received from John in 1207; and a third, constituting it a free borough for ever, was obtained from Henry III. in 1227. The town flourished under the privileges thus granted. During the civil war it held out for twenty-four days against the army under Prince Rupert; at the expiration of that term the place was taken, and many of the garrison and inhabitants were put to the sword. Until the close of the seventeenth century Liverpool was a chapelry attached to the parish of Walton, but at that time it was made a separate parish, the population of which was about 5000 souls. In 1639 it is said there were only fifteen ships belonging to the port. Towards the middle of the next century three docks were constructed for the convenience of the shipping employed in the African and West Indian trades. The chief exports were then, as at present, furnished by the manufacturers of Yorkshire and Manchester, and consisted of hardwares, cutlery, and woollen goods. These were shipped in slave-ships to the coast of Africa, where they were bartered for negroes, who were conveyed to the West India plantations; the ships returning thence loaded with sugar and rum. In 1764 more than half the African slave-trade was carried on by the merchants of Liverpool. That trade has happily ceased since 1806, and this town has obtained an ample compensation for the loss in the rapid extension of the cotton manufacture, which having its principal seat in Lancashire and the adjoining county of Cheshire, Liverpool has become the port where the great bulk of the raw material of the manufacture is received, and whence the exports of manufactured goods are chiefly made to all parts of the world. Still more recently, and especially since the employment of steam-vessels for the conveyance of merchandise, this port has enjoyed a very large proportion of the trade between England and Ireland, for the prosecution of which it is peculiarly well situated. This intercourse having been placed upon the footing of a coasting-trade, and no entries of the goods conveyed being required by the custom-house, it is not possible to give any accurate account of its extent. Some idea of its importance may however be formed from the following statement of the quantity and value of animals and agricultural produce brought into Liverpool from Ireland in the years 1831, 1832, and 1837, compiled by the managers of the steam-vessels engaged in that trade:—

	1831.		1832.		1837.

No considerable town in England has received greater improvement during the past half century than Liverpool. Before that time the streets were narrow and inconvenient, and the buildings were wholly devoid of architectural beauty, but successive alterations have given to the town an amount of commodiousness and elegance not to be met with in any other commercial port in this country. This altered condition has been produced by the exertions of the corporation, in whom is vested the property of a great proportion of the houses. As the leases of these have progressively fallen in, they have been renewed only on the condition of expending the sums necessary for the required embellishment. The value of the corporation estates is estimated at three millions of money, and the annual income derived from rents and dock-dues has of late increased to upwards of 320,000*l.* A great proportion of this income has been devoted to the improvement of the town, including the building of churches, hospitals, and other charitable and public edifices. The sum expended in these objects, including the cost of widening streets, between 1786 and 1838, is stated to have amounted to 1,668,500*l.* The disbursements of the corporation have so far exceeded its income that it has incurred a considerable debt, and in October 1832, when a Report was made on the subject, the amount of its outstanding bonds was 792,000*l.*

The most important public buildings are the town-hall, the Exchange buildings, and the custom-house. The building of the town-hall was begun in 1749, but was not completed in its present form and extent until near the end of the last century. The interior was accidentally burnt in 1795, and restored, with many improvements, at an expense of 110,000*l.* The ground-floor of this building contains the council-room, several committee rooms, the mayor's, town-clerk's, treasurer's, and town-surveyor's offices. The principal story is approached by a very handsome staircase, and contains a very fine suite of rooms, which are magnificently furnished. The saloon is 30 feet 6 inches long and 26 feet 6 inches wide. The two drawing-rooms are respectively 32½ feet and 30 feet long, and 27 feet wide. The large ball-room is 89 feet long, 41½ feet wide, and 40 feet high; the second ball-room is 61 feet by 28, and 26 feet high; and the banquet-room, in which the mayor receives his guests, is 50 feet by 30, and 25 feet high. The whole of these rooms communicate with each other. The staircase is lighted by means of a dome with lateral windows: the height from the floor of the building to the centre of the dome is 106 feet. The staircase is ornamented by a colossal statue of Canning, by Chantrey, and surmounting the dome is a colossal figure of Britannia.

The Exchange buildings form with the town-hall three sides of a quadrangular area, which is used by the merchants of Liverpool as an Exchange. This quadrangle is 197 feet long from north to south, and 178 feet wide; it therefore contains 35,066 square feet, which is more than twice the size of the recently destroyed Royal Exchange of London. The buildings which form the west side of the area are occupied as offices by merchants; while the east side comprises a news-room, 94 feet by 52 feet, which is frequented by the merchants and brokers; and an underwriters' room above, of somewhat smaller dimensions. The architecture of the two wings harmonises with that of the town-hall. In the centre of the area is a bronze monument, erected in honour of Lord Nelson. This monument, which is executed in bronze, consists of a marble basement and a circular pedestal, supporting figures emblematical of Nelson's principal victories. The statue of the dying admiral rests one foot on a prostrate enemy, and the other on a cannon; and he is receiving upon his sword a naval crown from Victory.

The custom-house, in which are also contained the dock offices, the excise-office, and where it is intended shortly to place the post-office and the office for the distribution of stamps, is situated on the site, now filled up for that purpose, of the old dock. The land on which it stands, valued at 90,000*l.*, was given by the corporation, which also undertook to expend 175,000*l.* in the erection of the building, under an agreement with the government, by which, in consideration of 150,000*l.*, to be paid by annual instalments of 25,000*l.* each to the corporation, the latter was bound to make over the property to the government at the end of twenty years. The extreme length, measuring from east to west, is 466 feet 8 inches. The principal front faces the north, and in the centre there is an octostyle Ionic portico, with columns of five feet diameter; and at each end are projecting wings, each of which is 94 feet wide. The basement is used for storing bonded goods; the west wing is occupied by different offices of the custom-house; and the centre contains the 'long-room' of that establishment and the approaches to other parts of the building. The east wing contains the excise-office and the dock offices, and will also afford accommodation for the post-office and the stamp-office. The long-room is 146 feet in length, 70 feet wide, and 45 feet high, and is surmounted by a dome 50 feet high: the passages and staircases of the wings are lighted by means of two smaller domes. The height of the rooms in the principal story is 20 feet, in the second story 21 feet 6 inches, and in the attics 14 feet 8 inches.

Liverpool contains 28 churches, some of which are handsome modern buildings; besides numerous chapels and meeting-houses, belonging to the Roman Catholics and various denominations of Protestant Dissenters. The church dedicated to Saint Nicholas, the tutelar saint of mariners, according to the Romish calendar, is the oldest place of worship in Liverpool, having existed as a chapel-of-ease under Walton parish before the town became a separate parish; it stands near the river, at a short distance from the town-hall. The body of the church was rebuilt in 1774; and the tower, which fell down in 1810, has since been rebuilt in a gothic style: it has a peal of twelve bells. Many of the churches were built with the funds of the corporation, but others have been erected at the cost of private individuals under private acts of parliament. The town contains many buildings devoted to charitable purposes. The workhouse, which is one of the best managed in the kingdom, is almost like a little town: it will accommodate about 1800 people; a fever hospital belongs to it. The infirmary, originally opened in 1749, was rebuilt on a better site in 1824 at the cost of 27,800*l.* It contains 234 beds for male and female patients. The lunatic asylum, which is capable of accommodating sixty patients, is a neat and commodious building, with spacious cells and day rooms, and furnished with warm baths. The foundation stone of this asylum was laid in January, 1829, and the building was erected at the cost of about 11,000*l.* A building previously used for the same purpose is now used as a barrack. Besides these there are two smaller hospitals, two dispensaries, and an ophthalmic infirmary. The Blue-coat School, established in 1709, has accommodation for 250 boys and 100 girls, who are educated, boarded, and clothed gratis. There are also charity schools for the blind, and for the deaf and dumb, the corporation free-schools, and numerous other schools supported by different denominations of Christians. The Mechanics' Institution in Mount Street is built on ground given by the corporation, and cost 11,000*l.* The theatre or lecture-room, will contain 1200 persons; it was publicly opened during the visit of the British Association at Liverpool in 1837. Attached to this institution are schools in which, for very moderate charges, boys receive a good education according to the station which they are intended to occupy. There is no town in the kingdom which, in proportion to its size and population, is better provided than Liverpool with scientific and literary institutions. The Royal Institution, formed in 1814 by Mr. Roscoe, by shares or subscriptions of 100*l.* each, was opened in 1817, and in 1822 the subscribers were incorporated by royal charter. The building has a frontage of 146 feet, and contains numerous spacious apartments, among which is a lecture-room, capable of accommodating 500 persons. The second and third stories of the building are occupied by the Museum of Natural History, which is the largest and most valuable in that part of the kingdom. The institution likewise possesses many valuable paintings; casts of the Ægina Marbles and the Phigaleian Frieze, and an extensive collection of philosophical apparatus. Courses of lectures are given on literature, on the various branches of physical science, and on the different branches of medical knowledge. There is also a grammar-school attached to the institution. The Literary, Scientific, and Commercial Institution was set on foot in 1835 by a number of young men engaged in commercial pursuits, and already contains a library of 2200 volumes. It is supported by an annual subscription of 2*l.* from the members, for which they have the advantage of a news-room, lectures on various literary and philosophical subjects, and classes for the acquisition of languages and other branches of learning. The Medical Institution, recently built at the cost of about 3000*l.*, contributed chiefly by members of the medical profession, contains a museum and library, and comprises various halls and committee-rooms, and a theatre capable of holding 500 persons.

The borough gaol is a large building, on the plan recommended by Howard; it has been principally used for the confinement of debtors. The County House of Correction at Kirkdale stands within the limits of the borough; it contains more than 400 cells, and is calculated for the reception of 500 prisoners. This establishment was formerly situated at Preston, and was removed to Liverpool because the large proportion of the prisoners being furnished from its population, a considerable expense in their conveyance would by that means be saved to the county.

The market-places in Liverpool are upon an extensive scale: Saint John's Market, which stands in the centre of the town, covers a space of 1¾ acres, being 550 feet long and 135 feet wide, the whole under one roof, supported by 116 pillars. Meat, poultry, fruit, and garden vegetables, are daily sold in this market, but the principal market-days are Wednesday and Saturday. The fish-market is on the opposite side of the street in which Saint John's Market stands. There are several smaller market-places in different parts of the town.

The principal places of public amusement are:—the Theatre, on the east side of Williamson Square; the Royal Amphitheatre, in Great Charlotte Street; the Liver Theatre, at the top of Church Street; the Wellington Assembly-Rooms, in Mount Pleasant; and the Rotunda, in Bold Street. There are also a large and well-stocked botanic garden at Edge Hill and a zoological garden in Derby Road.

Several cemeteries on a large scale have lately been made in or near Liverpool: that of St. James, which is formed out of an old stone-quarry, contains the statue of Mr. Huskisson, who is interred there.

The town is plentifully supplied with water by a company connected with the corporation, formed in January, 1800, and incorporated by act of parliament, and by a second company, which brings its water from the village of Bootle, about three miles from the town to the north. The streets and shops are well lighted with coal-gas, supplied by two companies, which make handsome returns to the proprietors.

The growth of the town will be seen from the following statement of its population at different times, from the end of the seventeenth century:—

Years.	Population.	Years.	Population.
1700	5,714	1770	35,600
1710	8,168	1777	34,107
1720	11,833	1790	55,732
1730	12,074	1801	77,708
1742	18,000	1811	94,376
1756	18,500	1821	118,972
1760	25,787	1831	165,221

By the Municipal Corporation Act (5 & 6 Wm. IV., c. 176), the council consists of a mayor, 16 aldermen (one for each of the sixteen wards into which the town is divided), and 48 councillors, one-third of whom are elected every year, those who vacate their office being eligible for re-election. The mayor is a justice of the peace during his year of office, and for one year after. The aldermen serve for six years: one-half are elected every three years. The council thus constituted has the right, under a private act of parliament passed in 1835, of nominating persons to fill corporate offices, and is empowered to make laws for regulating the police of the town, of the docks, and of the port generally, for lighting and watching the town, and for the suppression of disorderly and immoral practices. General sessions of the peace are held four times in the year, in which the recorder, who is appointed by the crown, presides as judge. The assizes for the hundreds of Salford and West Derby, forming the southern division of the county, are held in the town. Liverpool is a parliamentary borough, sending two members to the House of Commons. The right of voting rests in the householders occupying premises of the annual value of 10*l.* and upwards, and in all free burgesses not receiving alms. The number of persons registered as electors in these two classes, in 1836 and 1837, respectively was:—

	1836.	1837.
Householders paying rates	10,252	10,715
Freemen	3,197	3,175
	13,449	13,890

The number of actual electors is not so great as is indicated by the registers, because some names are entered in both capacities. The number who gave their votes at the general election in 1837 was 9091, of whom 6670 were householders, and 2421 were freemen.

The living is a rectory, divided into 'two *medieties*—the new church of St. Peter, and the parochial chapelry of St. Nicholas.'

The progress of Liverpool as a commercial port may be traced from the receipt of customs duties during the last 100 years, which has been as follows:—

Years.	Customs Receipt.	Years.	Customs Receipt.	Years.	Customs Receipt.
1733	£92,466	1800	1,058,578	1829	3,315,041
1750	215,961	1805	1,766,370	1830	3,562,114
1755	202,367	1810	2,675,766	1831	3,509,206
1760	248,312	1815	2,360,967	1832	3,925,062
1765	269,435	1820	1,488,072	1833	3,733,132
1770	231,994	1824	1,984,522	1834	3,846,306
1775	274,655	1826	3,087,651	1835	4,272,847
1780	188,830	1827	3,308,804	1836	4,450,426
1785	680,928	1828	3,180,503	1837	4,351,496
1795	469,438				

The growth of the trade of Liverpool has been further shown by the number of vessels unloaded in the docks, and the amount of dues collected on the same. [DOCK.] The number of ships unloaded and amount of dues collected in each of the years ending 24th of June, 1837 and 1838, were,—

	Ships.	Dock Dues.
1837	15,038	£191,330
1838	14,820	161,843

The course of the trade of the port is shown by the following statement:—

Number and Tonnage of Vessels Entered Inwards and Cleared from the Port of Liverpool during the year 1837, *under each of the different Heads below stated.*

	INWARDS.				OUTWARDS.

It will be seen from this statement that very nearly two-fifths of the tonnage inwards and outwards are engaged in the trade with the United States of America, and that of the shipping so engaged nearly four-fifths are under a foreign flag. It will be further observed, that the intercourse with Ireland is about equal in amount to that kept up with every port in Great Britain.

Liverpool has benefited more than any port in the kingdom (London alone excepted) from the application of steam-power to navigation. Steam-ships of the first class proceed to and arrive from Dublin daily. With Drogheda the intercourse is kept up four times a-week; with Belfast three times a-week; with Waterford, Newry, and Londonderry, twice every week; with Glasgow daily; with the Isle of Man, Beaumaris, Bangor, Menai Bridge, and Carnarvon, as frequently; and throughout every day the Mersey is enlivened by steam-vessels, conveying passengers to and from the towns and villages on the opposite side of the river.

The inland trade of Liverpool is much assisted by means of canals, the most important of which in extent is the Leeds and Liverpool canal, 128 miles long. The Mersey and Irwell navigation served until the opening of the Liverpool and Manchester railroad for the conveyance of bulky and heavy goods to and from Manchester. The Duke of Bridgewater's canal connects the Mersey with Birmingham and Staffordshire, and, joining the Grand Trunk canal, thus perfects the communication with London. The trade with North Wales, through the western part of Cheshire, is carried on by means of the Ellesmere canal; and the river Weaver navigation connects Liverpool with the salt district and the heart of Cheshire. [CANALS.] The modern adaptation of iron railways for the rapid conveyance of goods and passengers was first brought into practical operation by the Liverpool and Manchester railway, which was opened for use in September, 1830. The traffic upon this line from that time to Midsummer, 1836, since which date such particulars have not been made public, was as follows:

	Merchandise. Tons.	Coal. Tons.	Passengers. Number.
From 16 Sept. to 31 Dec., 1830	1,433	2,630	71,951
" 1 Jan. to 30 June, 1831	43,070	2,899	188,726
" 1 July to 31 Dec.	65,483	8,396	256,321
" 1 Jan. to 30 June, 1832	72,601	29,456	174,122
" 1 July to 31 Dec.	86,842	39,940	182,823
" 1 Jan. to 30 June, 1833	96,457	41,375	171,421
" 1 July to 31 Dec.	98,247	40,134	215,071
" 1 Jan. to 30 June, 1834	104,356	46,039	200,676
" 1 July to 31 Dec.	106,380	53,298	235,961
" 1 Jan. to 30 June, 1835	113,647	55,444	205,741
" 1 July to 31 Dec.	116,982	60,802	268,106
" 1 Jan. to 30 June, 1836	117,617	68,893	222,848
	1,023,120	449,296	2,393,767

From these figures, which do not include great numbers of cattle, sheep, and swine conveyed from Liverpool towards the interior of the country, it appears that in less than six years there were conveyed upon this railway nearly two millions and a half of passengers, and but little short of a million and a half tons of merchandise and coals. Exactly one century before the opening of this line, the town of Liverpool contained only one carriage, and no stage-coach came nearer to the town than Warrington, the traffic being then principally carried on by means of pack-horses. In 1760 there was only one stage-coach between Liverpool and London, and the journey required four days: the first mail-coach to London began to run on the 25th July, 1785. Now that the time required for the performance of this journey has been reduced, by means of the Grand Junction and Birmingham railways, to a ride of ten or eleven hours, the number of passengers must be reckoned by hundreds of thousands in the year, an alteration which adds another and an effective element towards the continued growth and prosperity of Liverpool.

It appeared from the annual bills of mortality printed at Easter, 1838, that the number of baptisms in the town and vicinity during the year was 10,145, the number of marriages 3017, and of burials 9979. Of the births and baptisms, there were belonging to the

LIVIA. [AUGUSTUS.]

LI'VIUS, with his full name, LU'CIUS LI'VIU ANDRONI'CUS, was the first person who introduc regular drama upon the Roman stage. (Liv., vii. 2.) H is said to have been the slave and afterwards the freedm of M. Livius Salinator. The time and place of his b are uncertain; but his first play was probably exhibited B.C., in the year before Ennius was born. (Cic., *Brut.*, c. 1 *Senect.*, c. 14; *Tuscul.*, i. 1; Gell., *Noct. Attic*, xvii. 21.) W learn from Livy the historian, that he acted in his pieces, and that after his voice failed him, in consequence the audience frequently demanding a repetition of th favourite passages, he introduced a boy to repeat the wo while he himself gave the proper gesticulations. (Liv., 2.) The fragments of his works, which have come dow us, are too few to enable us to form any opinion respecti them: Cicero says that they were not worth being read a cond time. (*Brut.*, c. 18.) They were however very pop at the time they were performed, and continued to be re in schools till a much later period. (Hor., *Epist.* ii., i. 69- The hymns of Livius were sung on public occasions, in or to avert the threatened anger of the gods. (Liv., xxvii. 3 Festus informs us (under *Scribas*) that the Romans p distinguished honour to Livius, in consequence of the cess which attended their arms in the second Punic W after the public recitation of a hymn which he had posed. Livius wrote both tragedies and comedies: t appear, if we may judge from their names, to have chiefly taken from the Greek writers. The titles, which been preserved, are—Achilles, Adonis, Ægisthus, Ajax, dromeda, Antiopa, Centauri, Equus Trojanus, Helena, H mione, Ino, Lydius, Protesilaodamia, Serenus, Ter Teucer, Virgo.

LI'VIUS, TITUS, the Roman historian, was bor Patavium (Padua), B.C. 59. We possess very few par lars respecting his life. He appears to have lived at R and to have been on intimate terms with Augustus, used, according to Tacitus (*Ann.*, iv. 34), to call him a P peian, on account of the praises which he bestowed upon P pey's party. He also appears to have superintende studies of Claudius, who was afterwards emperor. (S *Claud.*, c. 41.) He died A.D. 17, in his 76th year.

Livy's great work, which was originally published in books, gave an account of the history of Rome, from earliest period to the death of Drusus, B.C. 9. Of books only 35 are now extant, namely, the first ten, w contain the history of the city to B.C. 293; and from twenty-first to the forty-fifth inclusive, which comm with the second Punic War, B.C. 218, and continue th tory to the conquest of Macedon, B.C. 167. There als brief epitomes of the lost books, as well as of those w have come down to us, which have been frequently posed, though without sufficient reason, to have been piled by Florus. We have however only epitomes of books; but it has been satisfactorily shown by Sigoniu Drakenborch, on Livy, *Ep.* 136, that the epitomes of 136th and 137th books have been lost, and that the epi of the 136th book, as it is called, is in reality the epit the 138th. Many hopes have been entertained at va periods of recovering the lost books of Livy's original w but they now appear to be irrevocably lost. Erpenius others stated that there was a translation of the Arabic; but such a translation has never been discover The fragments of the lost books, which have been pres by grammarians and other writers, are given in Drak borch's edition That portion of Roman history which w contained in the lost books, has been written in Latin by Freinshemius with considerable diligence, and has been published in the Delphin and Bipont editions, together with the extant books.

We have no means for ascertaining at what time the whole of the history was completed, though there are indications of the time in which some particular portions were written. In i. 19, Livy mentions the first shutting of the temple of Janus by Augustus after the battle of Actium, B.C. 29; whence we may conclude that the first book was written between this year and B.C. 25, when it was closed a second time. He must also have been engaged on the 59th book after B.C. 18, since the law of Augustus, 'De maritandis ordinibus,' passed in that year, is referred to in the epitome of the 59th book.

The fame of Livy appears to have been widely extended even during his life, if we may believe a story related by Pliny (*Ep.*, ii. 3), and repeated by Jerome, that a native of Cadiz came to Rome with the sole object of seeing the great historian. Tacitus (*Ann.*, iv. 34) and Seneca (*Suasor.*, vi.), among the later Roman writers, speak in the highest terms of the beauty of his style and the fidelity of his history—praises which have been constantly repeated by modern writers. But while most will be ready to admit that his style is eloquent, his narrative clear, and his powers of description great and striking, it can scarcely be denied that he was deficient in the first and most important requisites of a faithful historian, a love of truth, diligence and care in consulting authorities, and a patient and pains-taking examination of conflicting testimonies. The chief merits and defects as an historian have been ably drawn by Professor Malden in his 'History of Rome' published by the Society for the Diffusion of Useful Knowledge (pp. 37-41), from which we extract the following remarks:—

'Livy made very little use even of such inscriptions and public documents as were within his reach. He appeals indeed to the treaty of Spurius Cassius with the Latins, engraven on a column of brass (ii. 33); but in the notable instance of the inscription on the Spolia Opima of Cornelius Cossus, preserved in the temple of Jupiter Feretrius, which was at variance with the received fasti (or register of magistrates) and the common accounts of historians, he does not appear to have had the curiosity to examine the monument himself, but is content with repeating the report of Augustus Cæsar (iv. 20). This is one of the few passages in which he descends to a critical comparison of evidence and authorities; and it will serve as a proof how little expert he was in that art of an historian, and how little he valued its results; for though in the digression he professes to believe in the superior authority of the inscription, in the main course of his narrative he follows the beaten track of the writers who had gone before him. He makes no mention of other monuments which we know to have existed; the brazen column in the temple of the Aventine Diana, on which was engraven the treaty of Servius Tullius with the Latins, with the names of the tribes who were members of the league (Dion., iv. 26); the treaty of Tarquinius Superbus with Gabii, written on a bull's hide, and preserved in the temple of Dius Fidius (Dion., iv. 58); a treaty with the Sabines, of the time of the kings (Hor., *Epist.*, ii. 1, 25); the treaty with Carthage in the first year of the republic (Polyb., iii. 22) (and here his negligence is without excuse; for, even though the document itself might have perished before his time, he could have found the translation of it in Polybius, if he had consulted him before he began to narrate the Punic wars); and finally, the treaty with Porsenna, which was known to Pliny (*H. N.*, xxxiv. 14). He does not therefore found his narrative upon contemporary records, but avowedly draws his materials from the works of previous annalists, Fabius Pictor, Calpurnius Piso, Valerius Antias, Licinius Macer, Ælius Tubero, and reposes upon their authority. As long as his guides agree in the main points of their story, he follows them without fear or doubt. When they openly contradict each other, especially on questions of names or dates, then he sometimes honestly confesses the difficulty, and acknowledges in general terms the uncertainty of the history of the first centuries of the city. But very many discrepancies less flagrant, and even some as important as those which he has specified, he passes over without notice; and yet we know with certainty that they existed, because they appear in the narrative of Dionysius, who drew from the same authorities as Livy. But though the current of his narration is sometimes checked by the conflict of external testimony, he is never induced to pause in doubt by any internal difficulty, any inconsistency or contradiction, or perplexity in the received story. Nothing less than a miracle is too strange for his acquiescence. It is evident that he has bestowed no labour upon examining the probability of the events which he relates, or investigating their connection as causes and effects.

'There are also sufficient proofs that he wrote hastily, and even carelessly. He sometimes mentions incidentally in a subsequent part of his history, circumstances which he has omitted in their proper place. Thus it is only by his remarks on the proposal for communicating the dignities of pontiff and augur to the plebeians (x. 6) that we learn from him that Ramnes, Titienses, and Luceres, were names of the antient tribes. He sometimes repeats (xxxv., 21 and 40), sometimes contradicts himself (xxx. 22, and xxxiv. 44). It is an instance and proof both of his carelessness and his want of familiarity with the antiquities of his country, that though he expressly informs us that, till a very short time before the capture of the city, the Roman way of fighting was in close phalanx with long spears, yet in no description of a battle does he allude to such tactics, and constantly uses of the older times the terms which relate to the more modern structure of the army. We cannot therefore feel assured that he always represented accurately the statements of the older annalists from whom he takes his materials.

'Any errors however which might arise from these causes would be single and detached, would bear but a very small ratio to the bulk of the history, and would not affect its general spirit. But the very tone and manner of Livy's work, however great may be his power of description, however lucid his style of narration, however much he may dazzle the imagination or interest the feelings of his readers, is a warning against implicit belief. He excelled in narration and in the eloquent expression of exalted feelings, and he obviously delighted in the exercise of his genius. In reporting the traditions of the early ages of Rome, he seems less desirous to ascertain the truth than to array the popular story in the most attractive garb. He is not so much an historian as a poet. As the history advances, and the truth of facts is better ascertained, he is of course compelled to record them with greater fidelity; but still his whole work is a triumphal celebration of the heroic spirit and military glory of Rome. Here then is a disturbing force which has borne him away from the strict line of historical truth. To this desire of exalting the glory of his country (and no doubt to a similar impulse actuating those from whom he copied) we must ascribe the singular phenomena which appear on the face of the history—that in perpetual wars with the surrounding states, the Romans were never defeated in the open field (ix. 19); that when they were distressed, it was always by pestilence, or famine, or sedition; and that at such seasons their enemies abstained from attacking them; that they gained victory after victory without subduing their opponents; that taken cities re-appear in the power of their original possessors; that consuls and dictators triumph in succession over nations that are still able to supply subjects for new triumphs to new consuls and dictators; that slaughters, which must have exhausted any state of antient Italy, diminished not the number of their perpetually renovated adversaries. To this passion for extolling the military reputation of Rome we owe the comparative neglect of the less popular and less ostentatious subjects of domestic history. Every war and triumph, of which any memorial, true or false, existed, is scrupulously registered; but the original constitution of the state, the divisions of its citizens, their several rights, the contests between the orders, the constitution of the general or partial assemblies of the people, the powers of the magistrates, the laws, the jurisprudence, their progressive melioration; these are subjects on which our information is vague and scanty and ill-connected. It is evident that in the mind of Livy they possessed comparatively little interest; and that on these matters, to say the least, he did not exert himself to correct the errors or supply the defects of the writers who preceded him. He was satisfied, if from a popular commotion he could extract the materials of an eloquent speech. It is a sufficient proof that on this most important portion of Roman history he was really ignorant, that with all his powers of language he does not convey clear and vivid ideas to the minds of his readers. Who has risen from the perusal of the early books of Livy with the distinct notion of a client or of an agrarian law?'

In addition to the history of Rome Livy wrote several [illegible] which [illegible] the [illegible] and [illegible] Quintilian (*Inst. Orat.* x. [illegible]) a letter to his son, recommending the study of Demosthenes and Cicero.

The best editions of Livy are those by Crevier, 173[illegible]; Drakenborch, [illegible]; Ernesti, [illegible]; Ruperti, [illegible] and Kreyssig, 182[illegible]-182[illegible]. His Roman history has been translated into most European languages, but we are not aware of any one which gives a [illegible] representation of the original work: the most esteemed are the translations in German by Wagner (17[illegible]) and [illegible] in Italian by Nardi, [illegible]; in English by Baker [illegible] and in French, by Dureau de la Malle and Noël, [illegible] and 1824.

LIVONIA, in German Liefland, is one of the Baltic provinces of European Russia, situated between [illegible] and [illegible] N. lat., and 21° [illegible] and 27° 30′ E. long. It is bounded on the north by Esthonia, [illegible] the government of [illegible], on the north-east by Lake Peipus, on the east by Pskow, on the south-east by Vitepsk, on the south by Courland, and on the west by the Baltic, which forms the great island of Oesel and some smaller [illegible] belonging to this province. The area, according to [illegible], is [illegible] square miles, but other writers make it [illegible] square miles. The province [illegible] name from [illegible] the *Liven*. Livonia [illegible] *Liven*, [illegible] and the Lettish *Letti*[illegible]. The surface [illegible] and gently undulating, [illegible] There are no mountains properly so called: the highest [illegible] is the Munaberg. [illegible] Livonia [illegible] forests, lakes, rivers, marshes, [illegible] The soil [illegible] the sea-coast [illegible] is very [illegible] in the interior, sand, clay, loam, and [illegible] mould, but there are also many very fertile tracts. In the east the appearance of the country is not pleasing: the better portions are in the south, especially on the banks of the Düna, where there is some very picturesque scenery. Most of the forests and marshes are in the west. The Baltic forms the great bay of Riga, between the continent and the island of Oesel. Of the lakes, 1[illegible] in number, the most considerable are—the great lake of Peipus, united by a narrow channel with that of Pskow on the north-east; and the lake Werzerwe, [illegible] square miles in extent, in the centre of the province, which is connected by the Great Embach with lake Peipus. The following are smaller, viz.:—lake Burtneek, from which the river Salis issues, and runs into the Bay of Riga; lakes Marienburg, Fellin, Lubahn, Sentsee, and others. The principal river is the Düna, which is the boundary between Livonia and Courland till it reaches Kreutzburg, where it changes its direction, and empties itself at Dünamünde, below Riga, into the bay of Riga. It receives on the right side the Ewest and the Oger, and on the left the Bolderaa, which runs from Courland along the Bay of Riga and falls into the Düna near its mouth. Other smaller rivers are—the Aa, which rises in the circle of Wenden; the Salis; the Pernau, which empties itself at Pernau into the Bay of Riga; the Little Embach, which flows into lake Werzerwe which it leaves as a navigable stream under the name of the Great Embach, and runs into lake Peipus. The smaller rivers and streams are near 300 in number.

The climate is disagreeable, being cold and raw till the end of May, but very hot in the three summer months, with frequent thunder-storms. September has often some fine days, though occasionally with night frosts. On the whole the weather is very changeable and unsettled.

The chief occupation of the inhabitants is agriculture. The country produces corn, chiefly rye and barley, flax, hemp, and linseed. The fruit, such as apples, plums, and cherries, is very indifferent. There are some good horses on the estates of the nobles, but those of the peasantry are small and of little value. The horned cattle are small; sheep of the German breed are kept by the nobles; the peasants have an inferior breed, the coarse black wool of which is manufactured into cloth. Goats, swine, and domestic poultry are kept chiefly by the nobles, citizens, and clergy. There is abundance of game, white and grey hares, and especially feathered game: of beasts of prey there are bears, wolves (in large numbers), lynxes, and foxes: and of animals hunted for their fur, beavers, [illegible], martens, badgers, and squirrels. On the islands and [illegible] coast seals are taken, and fish of various kinds are [illegible], especially in lake Peipus. There are no metals. P[illegible] clay and limestone are obtained in some parts. There [illegible] no manufactures, properly speaking, except in Riga. The country people spin yarn and thread, and make coarse [illegible] linen, and woollen wares. The brandy-distilleries are numerous. The exports are corn, hemp, flax, and lin[illegible]; the imports salt, iron, lead, animal produce, wine, manufactured goods, and articles of luxury.

The population, according to the latest accounts we [illegible] procure, is [illegible], consisting of—1st, 33[illegible],000 L[illegible] the circles of Riga and Wenden, who probably settled here at the beginning of the twelfth century, and expelled the *Liven* or proper Livonians. They are a well-[illegible] pretty industrious, and cleanly race, of Slavonian origin, speaking a peculiar Slavonian dialect, and on the [illegible] more civilised in their manners than the Esthonians. [illegible] are mostly peasants. 2nd. *Liven*, or Livonians, now [illegible] found with the other inhabitants, but of whom there [illegible] be found in some villages in Wenden, who speak their [illegible] language, a dialect of the Finnish. 3rd. Esthonians, [illegible] the circles of Dorpat, Pernau, and Arensburg, wh[illegible] resembling their brethren in Esthonia, about 370,000. [illegible] Germans and Swedes, formerly the masters of the country, and now forming the nobility, clergy, and burghers in [illegible] towns; about [illegible]. 5th. Russians, [illegible]00, and a very [illegible] Jews. Almost the whole, except the Russians, who [illegible] the Greek church, profess the Lutheran religion. [illegible] are about [illegible] Roman Catholics and [illegible]0 Calvinists. [illegible] peasants were formerly serfs, but vassalage was abolished [illegible] and they are now nearly in the same condition as [illegible] German peasantry.

The provinces of Livonia, Esthonia, Courland, Semigallen belonged in the earliest times to the Russian state, to which however they only paid tribute, and [illegible] their own government. The Russians did not even [illegible] the enterprises of foreign conquerors: thus it happened [illegible] during the distracted state of Russia they made them[illegible] wholly independent of it, and could not be reduced to sub[illegible]jection till Peter the Great was able to assert his right [illegible] these provinces. Livonia was almost unknown to the [illegible] of Europe till 1158, when some traders from Bremen, [illegible] search of a new commercial intercourse with the [illegible] were driven on their voyage to Wisby in Gothland [illegible] the coast of Livonia. The people of Bremen now [illegible] the country more and more frequently for the purp[illegible] trade, and even formed settlements in it. In 11[illegible] [illegible]hard, an Augustine monk, with other Germans, settled [illegible] Livonia and having converted the natives to Christianity became the first bishop. But Albrecht, the third bishop, who came with a new company of adherents to the [illegible], was the first who was able to establish his spiritual authority on a secure foundation. He built in the year 120[illegible] the [illegible] of Riga, and fixed his see there.

Towards the end of the century Canute VI., king of Denmark, made himself master of these provinces, which W[illegible]mar III., one of his successors, ceded for a sum of m[illegible] the Teutonic order, which was united with the Order [illegible] Knights Sword-bearers, founded in 1201 by bishop A[illegible] so that the Teutonic Knights remained in possession [illegible] four provinces. At length the weakness of the Order [illegible] was unable to resist the czar Ivan II., Wasiljewi[illegible] sought to recover those provinces that had been de[illegible] from the Russian empire, caused the entire dissolution [illegible] whole state. Esthonia placed itself under the protec[illegible] Sweden; Livonia was united with Poland; Courl[illegible] Semgallen became a duchy under Poland, which G[illegible] Kettler, the last grand-master of the Teutonic order, [illegible] as a fief under that crown. From that time Livonia [illegible] the apple of discord for which Sweden, Russia, and P[illegible] disputed for a century (1561 to 1660). By th[illegible] of Oliva, in 1660, Poland ceded those provinces to S[illegible] and they were united with Esthonia. By the tr[illegible] Nystadt, in 1721, both were annexed to the Russian [illegible]

Livonia is divided into five circles, those of Riga, D[illegible] Arensberg, Pernau, and Wenden.

(De Bray, *Essai sur l'Histoire de la Livonie*, 3 vols., D[illegible]pat, 1817; Hassel, *Erdbeschreibung*, &c.)

LIVO'NECA. [ISOPODA, vol. xiii., p. 52.]

LIVORNO, called by corruption Leghorn by the English, and Livourne by the French, is a seaport town on the west coast of Italy, in the grand-duchy of Tuscany. It stands at the southern extremity of a low and partly marshy plain, which extends from the left bank of the Arno to the hills of Montenero, which are a projection of the ridge which runs by Volterra, and divides the basin of the Arno from that of the Ombrone or Maremma of Siena. The hills of Montenero end abruptly on the sea about three miles south of Livorno: they are naturally stony and barren, but the slope towards Livorno is covered with country-houses and gardens, which are the resort of the merchants and their families during the summer, and have a fine sea-view, which embraces the coast and the Apennines to the north towards the Gulf of La Spezia, the islands of Gorgona, Capraia, and Elba, and the mountains of Capo Corso, or the northern extremity of the island of Corsica. Livorno is 14 miles south by west of Pisa, and 45 west by south of Florence, in 43° 33′ N. lat. and 10° 19′ E. long.

The town is neatly and regularly built; the streets are wide and mostly straight, and there is a fine square in the middle of the town. The western district, called la Nova Venezia, is intersected with canals, by which the goods are carried in boats from the shipping in the harbour and landed before the warehouses of the merchants. Many of the private houses are handsome, uniting Italian outward architecture with interior comfort. The shops are well supplied with goods, and fitted up in good taste. Of all the towns in the Mediterranean perhaps Livorno most resembles an English town; the inhabitants are, by long intercourse, familiar with the English, and well disposed towards them, and the English language is spoken, or at least understood, by many of the natives. The people are active, steady, and peaceably inclined. A greater tolerance exists here than in any other part of Italy: the English and Lutherans have chapels and burying-grounds, the Greeks a church, and the Jews a very handsome synagogue. The English burying-ground, situated on the ramparts, is adorned with numerous marble monuments—among others that of Smollett, who died here. The town itself is little more than two miles in circumference; but two large suburbs, one beyond the north or Pisa gate, and the other to the south, called Borgo Cappuccini, have gradually increased to the size of towns, and have been lately included within the boundaries of the Porto Franco, wherein goods can be landed and warehoused, and exported again without paying duty. The outer mole, which is more than a mile in length, and joins the lighthouse, affords a pleasant walk. The harbour is tolerably large, but not sufficiently deep for large vessels, which lie in the roads, where the anchorage is safe and good. The Darsena, or interior harbour or dock, is only fit for smaller vessels. Near the Darsena is a fine colossal statue of Ferdinand I., the benefactor of Livorno. The lazzarettos, of which there are three, outside of the town and on the seashore, are remarkable for their excellent distribution and perfect security, being surrounded by wet ditches, and furnished with extensive warehouses and convenient lodgings.

Livorno is entirely a commercial place: it has however a casino, or assembly-house, a theatre, very good inns and coffee-houses, and the vicinity of Pisa affords the opportunity for a pleasant drive and an interesting excursion. Elementary schools and infant schools have been of late years established at Livorno; and the Jews, who are about 15,000 in number, and many of whom are descended from Spanish and Portuguese Jews expelled from the Peninsula two centuries since, vie with the Christians in promoting popular education. The population of Leghorn is now reckoned at 75,000, among whom are individuals of every nation in Europe, besides Turks, Moors, Armenians, and Jews from Africa and Asia.

Livorno has no claim to classical antiquity; it is first mentioned as a village, parish, and fort, adjacent to Porto Pisano, or the harbour of Pisa, in the eleventh century. It was ravaged in the wars between Genoa and Pisa, was taken possession of by the Visconti of Milan, and afterwards by the French General Boucicault, who sold it in 1407 to the Genoese for 26,000 golden ducats. Pisa and its port had fallen at that time into the hands of the Florentines, who not long after effected the purchase of Livorno from the Republic of Genoa, in 1421, for 100,000 golden florins. The Florentines established docks at Livorno, where they built their vessels, and surrounded the place with walls. As the neighbouring Porto Pisano became gradually filled up by the simultaneous effects of the alluvial deposits of the Arno and other streams, and by the sand thrown up by the western storms, the importance of Livorno as a port increased in proportion, until at last it entirely obliterated the former. But the great increase of Livorno took place in the following century, under the dynasty of the Medici. The grand-duke Cosmo I. granted to all new settlers privileges and immunities from taxes, and security from pursuit in consequence of debts contracted or penalties incurred in other countries. He also built a mole and light-house, and made it the station of the galleys of the military order of St. Stefano, whose avocation, like that of the order of St. John of Jerusalem, was to cruise against the Mussulmans. His successor Ferdinand I. greatly extended the improvements begun by Cosmo; he raised regular fortifications round the town, built warehouses, a fortress, a lazzaretto, and numerous other buildings, and excavated a navigable canal communicating with the Arno. He not only confirmed the privileges and immunities to new settlers granted by Cosmo, but he published an indulto in forty-eight articles, dated the 10th of June, 1593, by which merchants of all nations and of every religion, Greeks, Armenians, Turks, Jews, Moors, and others, were invited to come and settle at Livorno, without fear of being molested on account of their religion, and with full security for their persons and property. It happened that about this time the fanatical intolerance of the Spaniards was driving away the Jews and Moors from the Peninsula, and several thousand Jews availed themselves of the asylum thus offered to them by Ferdinand. A number of Corsicans, dissatisfied with their Genoese rulers, and of Provençals, scared away by the civil wars which desolated France, came also to settle at Livorno. Cosmo II. continued to favour Livorno, and gave it municipal statutes, built new ships of war, and when the edict of Valencia, in September, 1609, by Philip III., banished all the remaining Moors from Spain, Cosmo invited 3000 of those exiles to settle as colonists in the territory round Livorno. But the insubordination and fierceness of those strangers obliged the grand-duke some time after to embark them for the coast of Africa. Livorno has continued ever since to prosper through the enlightened protection of the successive grand-dukes and the tranquillity which Tuscany has in general enjoyed. During the first years of the war of the French Revolution, the neutrality adopted by the grand-duke Ferdinand, whilst all the rest of Europe was at war, favoured greatly the commerce of Leghorn. When Bonaparte however invaded Italy in 1796, he did not respect the neutrality of Tuscany, but sent a body of troops to seize upon all English, Portuguese, Neapolitan, and Austrian property at Leghorn, and even insisted that the merchants of Leghorn should deliver the balances and deposits which they had in their hands belonging to individuals of the above nations, an act of bad faith which the merchants honourably avoided by subscribing a round sum, which they paid to the French. After the rupture of the peace of Amiens, Livorno enjoyed a kind of neutrality under Maria Louisa of Spain till 1808, when Napoleon occupied Tuscany and annexed it to the French empire. Upon this, the trade of Livorno was annihilated, its counting-houses gradually became deserted, a ship seldom entered the harbour, many of the merchants wound up their accounts, and retired to Pisa and other places. Livorno was one of the ports which suffered most from the Continental system, and in which the dominion of Napoleon was most disliked. With the peace of 1814 the prosperity of Livorno returned, and it has made rapid strides ever since. Population and buildings have rapidly increased. The immunities of the Porto Franco have been extended to the suburbs, an aqueduct has been constructed, and other improvements have been effected. A railroad is now in progress between Livorno and Florence. A capital of thirty millions of Tuscan livres (one million sterling) has been raised by shares of 1000 livres each for the purpose. The length of the road will be about 50 miles.

The imports into Livorno are either for consumption or for deposit. In the first place, Livorno supplies with foreign goods Tuscany, Lucca, part of the Roman States, and partly also Modena and Parma. In the last century it used to supply Lombardy also, but Trieste has now supplanted Livorno in this branch of trade. The deposit trade of Livorno was also in the last century more extensive than it is now. The English, Dutch, American, and other ships from the Atlantic carried thither manufactures and colonial goods and exchanged them for cotton, silk, and other produce of the Levant, which were brought to Livorno by Italian and

Greek vessels. The facilities afforded by the lazzarettos and warehouses, the perfect freedom of trade, and the security enjoyed there, made Livorno a most convenient place of exchange between the Levant and the nations of western Europe. This relation of things is now materially altered. Commerce is become more direct: the English, American, and other vessels from the west proceed straight to the Levant and the Black Sea to exchange their cargoes, and the improvements that have taken place in Turkey of late years, and the security afforded to navigation by the state of general peace, all tend to favour the direct intercourse between consumer and producer, and to diminish the importance of ports of deposit, such as Livorno, Malta, Lisbon, &c. Still the transit trade of Livorno is considerable; its warehouses are always well supplied, and it is a convenient place especially for the smaller vessels from the coasts of Italy and its islands to take in their cargoes.

The principal articles of produce of the country exported from Livorno are: silk, either in thread or manufactured, to the amount of about three millions of francs annually; oil, two millions; straw hats, three or four millions—formerly this article amounted to seven millions of francs; iron from Elba, paper, potash, alabaster, coarse woollen cloths for the Levant, coral gathered on the coasts of Barbary and Sardinia, and manufactured at Livorno; and anchovies, which are fished off the island of Gorgona, opposite Livorno. The chief imports are: corn from the Black Sea, French woollens, English cotton goods, hardware, salt fish, and colonial articles. In 1832 the imports amounted to sixty-eight millions of francs, and the exports about fifty millions. In the same year there entered the port of Livorno 199 English vessels, 126 Austrian, 75 Russian chiefly from the Black Sea, 61 American, 30 Swedish, 9 Danish, 4 Dutch, 61 Greek, besides more than 2000 coasting vessels from the coasts of Italy, France, and Spain.

(Serristori, *Saggio Statistico;* Magri e Santelli, *Stato antico e moderno di Livorno*, 3 vols. 1772.)

LIVRE, antiently a money of account in France, afterwards a coin. The word is derived from the Roman *libra*, or pound, the standard by which the French money was regulated, twenty sous being made equal to the livre, or libra. Kelly, in his 'Complete Cambist,' vol. i., p. 141, says, 'Accounts are kept in France in francs of ten decimes, or a hundred centimes. Before the year 1795 they were kept in livres of 20 sous or 240 deniers. The livre and franc were formerly of the same value, but the franc is now 1¼ per cent. better; thus 80 francs equal 81 livres, and by this proportion the antient monies have been generally converted into modern. By a decree of 1810 the following proportion was established: pieces of 48 livres, at 47 fr. 20 centimes; pieces of 24 livres, at 23 fr. 55 centimes; of 6 livres, at 5 fr. 80 centimes; of 3 livres, at 2 fr. 75 centimes.

The livre was formerly of two kinds, Tournois and Parisis. The *Livre Tournois* contained 20 sous Tournois, and each sol or sous 12 deniers Tournois. The *Livre Parisis* was of 20 sous Parisis, each sous worth 12 deniers Parisis, or 15 deniers Tournois; so that a livre Parisis was equivalent to 25 sous Tournois; the word Parisis being used in opposition to Tournois on account of the rate of money, which was one-fourth higher at Paris than at Tours.

In the money of the Mauritius, or Isle of France, colonial livres are used, two of which equal a franc.

Kelly, *ut supra*, vol. i., p. 269, says, under 'Neufchatel in Switzerland,' there are different modes of keeping accounts here. The most antient method is in *Livres foibles*, of 12 gros or 144 deniers, which is partially retained, particularly in rents and inferior departments of business. The second way of keeping accounts is in livres Tournois of Neufchatel, divided into 12 sous or 240 deniers, one livre of which equals 2½ livres foibles, and is worth 13¾*d.* sterling money. Another mode was introduced in 1798, which is in franken of 10 batzen, or 100 rappen.

The *Lira Italiana* is the Italian livre; equal to the French franc, with its divisions and multiples in proportion. There is also the lira of Modena, and the lira of Reggio; the former worth 3¾*d.* sterling, the latter worth only two-thirds of the lira of Modena.

Accounts are likewise kept in several parts of Canada in livres according to the antient system of France. (Kelly, vol. i., p. 59; ii., 293.) This is called old currency.

LIXI'VIUM, a term which is synonymous with *ley*. It was used by the older chemists to signify a solution of an alkali in water; and what is now usually called an alkaline solution, or a solution of an alkali, was termed indifferently an alkaline ley or alkaline lixivium.

LIZARD POINT. [CORNWALL.]

LJUNGAN-ELF. [ANGERMANLAND.]

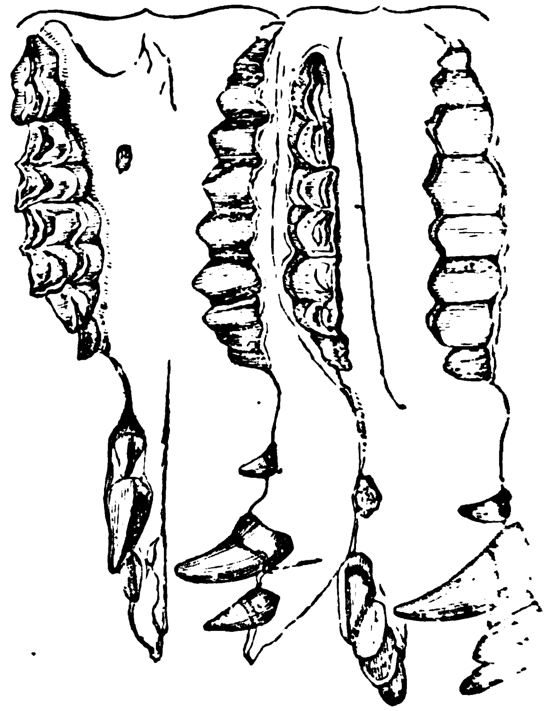
LJUSNAN-ELF. [SWEDEN.]

LLAMA (*Auchenia* of Illiger; *Lama* of Cuvier and others), the generic name for that form of the *Camelidæ* which is confined to the New World.

ORGANIZATION.

Dentition:—Incisors $\frac{2}{6}$, Canine $\frac{1-1}{1-1}$, Molars $\frac{5-5}{4-4}$ = 3

The difference between the dentition of the two sub-families of *Camelidæ*, *Camelus* and *Auchenia*, appears to consist mainly in the absence of the two small pointed teeth, which are found in the interval or 'bar' between the canines and the molars in the *Camels*, from the jaws of the *Llamas*. Thus the *Llamas* have four false molars, as they may be termed, less than the *Camels*. In other respects the dentition of the one is, as nearly as may be, the dentition of the other. The following cut exhibits the dental arrangement of the *Dromedary*, and will convey a sufficiently accurate idea of the same parts in the Llamas, if the spectator will suppose the absence of the four teeth already mentioned. The difference was considered by M. F. Cuvier to be of such small importance, that he has not considered it necessary to give a figure of the dentition of *Auchenia*.



Teeth of Dromedary. (F. Cuvier.)

Baron Cuvier observes, that the *Camels* and *Llamas* in many points from the horned ruminants. Considered as a whole, the head of the former presents a narrower more lengthened muzzle (un museau plus aminci), a nium larger in proportion, orbits placed more forward the edges of those orbits more prominent, in consequence of the temples being more sunk.

In the *Llama* the bones of the nose are short, and extremity notched; their base is slightly enlarged: lacrymal bone is but little advanced upon the cheek, leaves a wide space between its anterior angle and upper external angle of the nasal bone. It does not the orbitary part of the maxillary bone, but stops at the suborbital internal hole; nothing of the vomer is seen above the spheno-palatine hole, and a small portion the pterygoïd internal apophysis scarcely shows itself. The parietal bones are soon united into a single bone wider than it is long; the posterior suture of which remains nevertheless, before the occipital crest. The temporal wing of the posterior sphenoid bone has a descending minence, and its pterygoid wing terminates in a point, which projects more than that of the pterygoid physis. The tympanic bones are compressed, but project very much: the occipital crest is well marked.

The true *Camels*, according to the same author, have the occipital crest still more marked and the temples still more sunken than they are in the *Llamas*, and almost as much as they are in the *Carnassiers*. The occipito-temporal suture is very much in front of this crest. The bones of the nose are of much less width at their bases, and there is a great space between the small membranous portion which exists at their angle and the lacrymal bone, which is extremely small on the cheek; it does not reach in the wild even to the edge of the anteorbital internal hole. There is, as in the *Llama*, a small membranous space between the lacrymal, frontal, and palatine bones, which advances to that spot by a small tongue-shaped portion. The wing of the vomer shows a small portion above the analogous hole of the spheno-palatine bones. The internal pterygoid apophysis as does not exist except towards the point of the wing; it does not rise till it reaches the body of the sphenoid bone, and there is no space between the wing of that bone and the wing of the palatine bone.

In all other respects, as regards the head, the *Camels* and *Llamas* offer a singular resemblance. The sockets of the incisors are smaller than in other ruminants, and the canal analogous to the pterygo-palatine terminates in the palate by more numerous holes. The oval hole is smaller. Internally the floor (plancher) of the cerebral cavity is much more united than it is in the *Deer* and the *Sheep*; the clinoid posterior apophyses form together only one small plate; and the region where the optic nerves are lodged is nearly on a level with that of the pituitary gland.

The anterior teeth of the *Camels* exhibit a considerable difference from those of the other ruminants; they have, in the first place, both above and below, the first molar, or rather false molar, detached from the others, and situated forwards, as we have seen above; and which, from its isolated position and pointed form, puts on the appearance of a canine tooth. They have moreover a true canine tooth implanted at the anterior border of the maxillary bone. This tooth becomes in aged subjects developed like the canine of one of the great *Carnassiers*. Lastly they have a true upper incisive tooth implanted in the intermaxillary bone, and this also puts on the form of a canine tooth: thus the *Camels* seem to have in the upper jaw three canines on each side. In the lower jaw they have only the eight ordinary incisors; but besides that the detached molar performs the office of a canine tooth, the external incisor has a pointed form and rises to interlock (s'engrener) between the upper canine and incisor: this then again represents a canine tooth, and in the old camel it has the entire appearance of a strong canine of a *Carnassier*.

'In the *Llamas*,' continues Cuvier, 'whilst they have, like the *Camels*, only five molars in a series, and often even only four below, I do not find the detached anterior molar, or at least I must think that it falls very early; but the upper canine and incisor, and the external incisor below, are disposed as in the Camels, and are only more compressed and more bent at their edges. In both these subgenera the lower incisors are large, strong, a little unequal, and directed forwards.'

The metatarsal and metacarpal bones of the *Camels* and *Llamas* are easily recognised, because they are divided higher than in the other ruminants and well above the articular pulleys. In the *Camels* the scaphoid and cuboid bones of the tarsus are not soldered, and always remain distinct. The two edges of the rotatory pulley (poulie rotatienne) of the *femur* are in the *Camel* nearly equal, as in the *Hog*. In the ruminants generally the ulna is scarcely more than an appendage to the radius, but the distinction generally remains marked throughout the length of the bones, though they become soldered by age, as in the *Ox*, *Deer*, *Sheep*, and *Gazelles*: in other cases the ulna disappears soon after passing the olecranon, as in the *Giraffe*, and still more in the *Camel*. In the *Camels* and the *Llamas* the tuberosities of the upper head of the humerus are not elevated as in the other ruminants. With regard to the pelvis, the *Camel* has the external angle of the ischium pointed and without truncation, and the spinal angle large and rounded; but this last is as much and more advanced than the other. The posterior front of the pelvis is enlarged, and its posterior border much more like that of the horse; and so it is in the *Llama*. (*Ossemens Fossiles*.)

Professor Owen has detected an osteological character, not noticed by Cuvier, which peculiarly marks the *Camelidæ*, viz. the absence of the perforations in the transverse processes of the cervical vertebræ for the transmission of the vertebral arteries.

In the structure of the stomach, the *Camelidæ* exhibit a marked difference from other ruminants. This part of the organization in the true Camels is explained in the article CAMEL; and though doubts have been thrown on the fact, the stomach of the *Llama* is formed upon the same peculiar principle as that which governs the development of this viscus in the *Camel*. Sir Everard Home maintains that, though a portion of the stomach of the *Llama* is, as it were, intended to resemble the reservoirs for water in the *Camel*, these have no depth, are only superficial cells, and have no muscular apparatus to close their mouths and allow the solid food to pass into the fourth cavity, or truly digesting stomach, without going into these cells. Mr. Knox, on the contrary, has shown that the real differences between the stomachs of the *Llama* and *Camel* are much less than had been imagined. The truth is, that in making observations on parts of this description, a great deal depends upon the care taken to keep the body of the subject in a fixed position. Thus we find Mr. Spooner, on the occasion of his reading his notes on the *post mortem* examination of a *Dromedary* that died in the Garden of the Zoological Society, observing that though he found nothing to add to the accounts already given by Daubenton and Sir E. Home, the cells of the first cavity in the subject on which he was reading contained food; and he was therefore induced to suggest that doubts might be entertained of the correctness of the generally received opinion that these sacs are destined to act as reservoirs for fluids.

Upon this, Mr. Owen stated that he also had found in the cells of the stomachs of *Llamas* which he had dissected more or less of food; but he suggested the probability that this might have been forced into them by moving the animal about after death, when, muscular power being abolished, resistance to the admission of the food into the cells would have ceased. He added, that in the instance of the *Camel* which was killed some years since at the Royal College of Surgeons (the particulars of the examination of which have been published by Sir E. Home), the cells of the second and first cavities of the stomach were found to be filled with water only: in that case the animal had been kept without drink for three days, was then allowed to drink freely, was killed three hours afterwards, and was opened without being moved from its erect position. Mr. Cox, on the same occasion, suggested that the existence of food in the cells in the instances referred to might perhaps be accounted for by the fact that the animals in question had been kept for many years in this country, where they were at all times provided with water: under these circumstances a receptacle for the preservation of fluid would not be called into use; and the cells having therefore ceased to be applied to that purpose, the muscular power of their apertures would have been consequently diminished. Colonel Sykes added, that on examining, in India, the stomach of a *Camel*, he had found the cells devoid of food. (*Zool. Proc.*, 1832.) Professor Owen informs us that the *Camel* killed at the College of Surgeons had been a long time in England; but the function of the water-cells was not altered, as the experiment clearly proved.

The student, if he be disposed to doubt at all, will have his doubts on this point cleared up by an examination of the parts in the Museum of the Royal College of Surgeons, prepared by Professor Owen; and, as this part of the subject is peculiarly interesting, we proceed to give a description from the pen of that gentleman of the preparations there preserved. No. 566 B (Physiological Series), is the stomach of a fœtal Llama (*Auchenia Glama*, Desmarest). This singular form of ruminating stomach, observes Mr. Owen, is peculiar to the Camel tribe; it is in some respects simpler than that of the horned ruminants, and in others more complicated. Like the stomach of the small species of Moschus (No. 534), the psalterium is less distinctly separated from the abomasus, and at this early period of existence it exhibits in the Llama a similar deficiency of the characteristic laminæ. The reticulum however is much more complex, each of the larger alveolæ being developed into many smaller ones, a structure partially indicated in the reticulum of the Goat (No. 554), and more strongly marked in that of the Ox (No. 464 A). There are moreover two groups of cells developed from the rumen, which differ from those of the reticulum in being shallower, and being visible from without, giving a sacculated character to those parts of the paunch. The several compartments of the stomach have been laid open in this preparation to show their communications with each other and the character of their inner surface. The rumen is lined with cuticle, but is wholly destitute of the villi which characterize it in the horned ruminants. It is partially divided into two compartments by a strong fasciculus of muscular fibres, which, commencing on the left side of the cardiac orifice, traverses the paunch longitudinally. On the right side of this ridge, about fourteen smaller muscular fasciculi pass off at right angles, and these ridges are connected by still smaller fasciculi, running transversely between them at different distances from each other: the quadrangular spaces which result from the above arrangement of fasciculi are partly closed by a production of the lining membrane, leaving a circular aperture in the centre of each square for the passage of liquids into the cells beneath. The compartment of the paunch to the left of the great longitudinal ridge terminates in two sacculi, at what may be considered the cardiac extremity. The sacculus nearest the œsophagus is simple: the one farthest from it is developed into a series of cells of a smaller size but of precisely similar construction to those on the opposite side of the paunch—a series of smaller muscular bands passing off at right angles from the larger one, which separates the two sacculi, and these lesser bands being connected by transverse fasciculi, in the intervals of which the cells are developed. The reticulum, or water-bag, is laid open, showing that the cells are situated between a series of parallel muscular fasciculi, as in the rumen: but their further subdivision is carried to a greater extent, and their orifices are not guarded by membranous productions. The external muscular coat of this cavity is so disposed that its exterior is smooth and uniform and the cells are scarcely visible from without. The œsophagus is laid open, so as to show the muscular ridge which traverses it longitudinally, and winds round the upper part of the reticulum to terminate at the orifice of the psalterium. 'It is obvious,' continues Mr. Owen, '[illegible] the contraction of this fasciculus, all communication between the first two cavities and the œsophagus would be cut off, and the remasticated food would be conducted, as in the true ruminants, into the third cavity. A slighter [illegible] would cut off the communication with [illegible] passage of fluids direct into the reticulum, [illegible] probably takes place when the [illegible]. A free communication however [illegible] water-bag and paunch. A porcupine's [illegible] the oblique canal leading to the [illegible] in the Camel is a small sacculus, [illegible] between the reticulum and [illegible] in the Llama; but on a [illegible] membrane nearest the orifice [illegible] to be produced into ridges, [illegible] or alveolar form; and as [illegible] distinctly observable in the [illegible] by Daubenton as the true [illegible] and the water-bag as a peculiar [illegible]. The remainder of the stomach in the fœtal [illegible] one elongated continuous cavity, [illegible] third without rugæ or laminæ, [illegible] developed at the cardiac half of [illegible] is a small transverse aperture [illegible] protuberance. The duodenum is [illegible] commencement. No. 566 C ex- [illegible] stomach of an adult Llama, [illegible] the upper part of the [illegible] food from the œso- [illegible]. The muscular fibres of the [illegible] of this canal, are [illegible] the aperture of [illegible] pass into the lesser [illegible] Mr. Owen, which, [illegible] of the third [illegible] the communication [illegible]. The commence- [illegible] third or supernu- [illegible] distended by a bristle. [illegible] of cells from [illegible]. The cuticle which lines [illegible] membrane [illegible] larger fasciculi. [illegible] bands, which are [illegible] to close the orifices of the cells.' Mr. Owen further observes that, after death, when these contractile parts have ceased to act, the smaller matters contained in the paunch, such as grains of oats, &c., may pass into these cells; but their contents are always found to be chiefly fluid. No. 566 E is the reticulum, second cavity, or true water-bag of the Llama. This cavity, Mr. Owen remarks, is not lined with cuticle, as in the horned ruminants; the other differences are pointed out in the description of the following preparation.[*] The muscular fibres of two of the larger ridges have been dissected; they form by no means such powerful fasciculi as in the corresponding ridges of the paunch-cells. The middle fibres in each ridge become tendinous; but the lateral fibres continue muscular, and pass off to the different connecting ridges, from which they spread over the entire circumference of the cells, and constitute the second or external muscular tunic of this part of the stomach. On the opposite side of the preparation a portion of the external layer of fibres is exhibited. (*Catalogue*, vol. i.)

We here see that the structure in this very essential part of the organization is similar in both the forms of the *Camelidæ*, and that the Llamas of the New World, as well as the Camels of the Old World, are provided with the means of preserving fluids in cells appropriated to that office. Such a provision is consistent with the localities and habits of both; for if the parched deserts wherein the lot of the Camel is cast require such a modification of the stomach, the Llama, whose stronghold is the mountain-chain that traverses the southern parts of America, and which is found high up on the Andes, often out of the reach of lakes, requires little less.

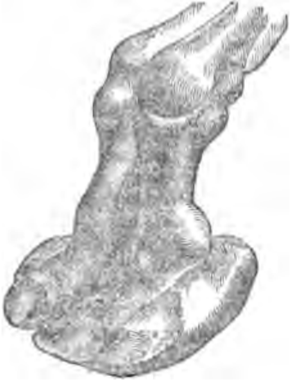
Mr. Owen, in his interesting paper 'On the Anatomy of the Nubian Giraffe,' states that the action of the abdominal parietes in rumination is much stronger in the Camel than in the Giraffe; and he observes that it is a singular fact, and one which has not hitherto been noticed, that the *Cameline Ruminants* differ from the *true Ruminants* in the mode in which the cud is chewed. In the *Camel* it is ground alternately in opposite directions from side to side: in the *Oxen*, *Sheep*, *Antelopes*, and *Deer*, the lower jaw is ground against the upper in the same direction, by a rotatory motion. The movements may be successively from right to left, or from left to right, but they are never alternate throughout the masticatory process, as in the *Camels*: and here again, he remarks, in the rotatory motion of the jaws of the *Giraffe*, while masticating the cud, we have evidence of its affinity to the horned ruminants. (*Zool. Trans.*, vol. ii. Communicated Jan. 18[illegible]

With regard to external characters, we have, both in the Llamas and the Camels, the long neck and comparatively small head, and the prolonged moveable upper lip, deeply fissured vertically; we miss, in both, the naked muzzle, and find the apertures of the nostrils mere fissures capable of being shut at pleasure. The differences in the dentition have been already noticed; and though we look in vain for the humps of the true Camels on the backs of the Llamas, yet there is, according to Molina, a conformation in the latter resembling that excrescence, and consisting of an excess of nutritious matter, in the shape of a thick coat of fat under the skin, which is absorbed as a compensation for occasional want of food. The most marked difference appears to exist in the structure of the feet; and this difference is, as we shall presently see, demanded by the several localities and habits of the two groups. No structure can be imagined more admirably contrived for the support and passage of an animal over arid sands than the elastic pad which forms the sole of the Camel's foot, and on which the conjoined toes rest.

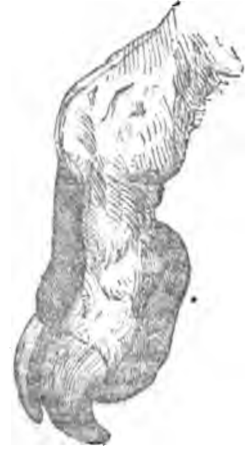
But the problem to be solved was the adaptation, in an animal of generally similar structure, of a foot to the exigencies of the case. The pad which connects the toes of the *Camel* beneath would have afforded no very sure footing to an animal destined to climb the precipices of the Andes; and we accordingly find, in the *Llama*, toes with strong and curved nails, completely separated from each other, and each defended by its own pad or cushion, so as to present the most perfect modification of the parts with a view to firm progression, either in ascent or descent, whilst there nothing in the structure calculated to impede great rapidity upon comparatively plain ground.

---

[*] No. 567, a portion of the reticulum, or water-bag, of a Camel, in [illegible] showing more distinctly the nature of its lining membrane, and that the surface of this cavity is a secreting and absorbing surface. The membrane has been removed from one of the greater and from some of the lesser [illegible] showing the muscularity of these parts, and that none of the fibres become tendinous, as in the Llama, in the larger bands. (*Cat.*) See, further, [illegible] vol. vi., p. 169.



Camel's Foot; skin removed.



Foot of Llama; with the skin on.

NATURAL HISTORY.

Considerable doubt is still entertained as to the number of species belonging to the genus *Auchenia*, and we shall endeavour to trace some of the accounts given, beginning with some of the earlier historians and zoologists, and continuing the inquiry down to the present time.

The Spaniards, when they conquered South America, found the Llama, which seems to have been the only beast of burthen possessed by the natives, to whom it likewise gave food and raiment; for the flesh was eaten by them, and the hair or wool was woven into cloth. We cannot be surprised that so useful an animal should have been called by the conquerors a sheep, especially when we recollect the qualities of its flesh and of its wool; and accordingly we find the Llamas described as sheep by the earlier Spanish writers. Thus, Augustin de Zarate, treasurer-general in Peru in 1544, in his account of the conquest, speaks of the Llama, as it was observed in the mountains of Chili, as a sheep of burthen. He says that in situations where there is no snow, the natives, to supply the want of water, fill the skins of sheep with that fluid, and make other living sheep carry the skins; for he remarks that these Peruvian sheep are large enough to serve as beasts of burthen. De Zarate evidently had the eye of a zoologist, for he says that these sheep resemble the camel in shape, though they have no hump. He states that they can carry about a hundred pounds or more, that the Spaniards used to ride them, and that their rate of travelling was four or five leagues a-day. His description appears to be that of an eye-witness, and bears upon it the impress of truth. When they are tired, says De Zarate, they lie down, and the load must be taken off, for neither beating nor help will make them get up. Their weariness is manifested in a very disagreeable way when a man is on one of them; for our author says that if the beast is pressed on under such circumstances, it turns its head and discharges its saliva, which has a bad odour, into its rider's face. He speaks of them as of great utility and profit to their masters, praises their good and fine wool, particularly that of the species named *pacas*, which have very long fleeces, and shows that their keep costs little or nothing, either in money or trouble; for they are satisfied with a handful of maize, and are able to go for four or five days without water. He declares that their flesh is as well-flavoured as that of a fat Castilian sheep, and notices the public shambles for the sale of it in all parts of Peru then frequented by these animals. But, he remarks, this was not the case on the first arrival of the Spaniards; for when an Indian killed a sheep at that time, his neighbours came for what they wanted, and then another Indian would kill a sheep in his turn.

The Llama soon found its way to Europe; for we find, in the 'Icones Animalium' (Gesner, &c.), a figure of one with a collar round his neck, led by a man, apparently his keeper. This figure is by no means badly executed, and is given as the *Allocamelus* of Scaliger, who speaks of it as an animal 'in terra Gigantum' (Patagonia probably), with the head, the ears, and the neck of a mule, the body of a camel, and the tail of a horse: 'Quamobrem ex Camelo et aliis compositum 'Αλλοκάμηλον appellavimus.' The figure, it appears, was taken from a print, with the following account:—'In the year of our Lord 1558, on the 19th day of June, this wonderful animal was brought to Middleburgh (Mittelburgum Selandiæ), having never before been seen by the princes of Germany, nor recorded by Pliny nor other antient writers. They said it was an Indian Sheep from Piro (perhaps Peru), a region nearly six thousand miles distant from Antwerp.' Then follows the description, from which it may be gathered that the animal was either a brown Llama or a pied one. The neck is stated to have been very white, 'cygneo colore candidissimum,' and the body rufous, 'rufum aut puniceum.'

John de Laet (fol., Leyden, 1633) appears to have collected most of the Spanish authorities up to his time. He quotes Garcilaso as saying that the domestic animals of the Peruvians are of two kinds, the greater and the less; which the Peruvians, as a common name, call *Llama*, that is, cattle or sheep (pecudes); thus the shepherds say *Llama michec.* They call the greater cattle (majus pecus) *Huanacu-llama*, on account of its similitude to the wild animal which is named *Huanacu*, and from which it differs in colour only; for the domestic Llamas (domesticum pecus) are found of various colours, like the horse; but the wild Llama is only of one colour, like chestnut. The greater kind have a great resemblance to a camel, except that they want the hump, and are not so large. The small kind (minus pecus) they call *Pacq-llama*, and this is only fed for its flesh and its wool, which is the best and longest, as it is unequal to the carrying of burthens.

De Laet then turns to Acosta. 'Peru,' says the latter, 'has nothing better or more useful than its cattle, which our countrymen call Peruvian sheep, but which the Peruvians, in their tongue, name *Llama;* for they bring large profit, and are kept for next to nothing (vilissimo alitur). These cattle furnish the natives with wool for their vestments, like our sheep, and are used by them as beasts of burthen. There is no necessity for shoeing them, guiding them by a rein, or feeding them with oats; for these animals serve their master gratuitously, being content with the wild herbs which they meet with everywhere. There are two kinds (species)—one which is woolly and called *Paco* by the natives, the other covered with a slight fleece (villis levibus) only, and nearly naked, whence it is more fitted for carrying burthens, called *Guanaco.* They are rather larger than sheep, but less than heifers, with a long neck like the camels, lofty legs, and a compact body: the colour is various, for some are white, some black, some brown, and some piebald (versicolores), which they call *Moromori.* Their flesh is good, although rather gross (spissior), but that of the lambs is much the best and the most delicate; but they are rarely killed, because they are of by far greater use as beasts of burthen, and their wool serves for making cloth. This wool the barbarians clean, spin, and weave into garments; but it is of two sorts, one coarser and more common, which they call *Havasca*, the other finer and more loose (absolutior), which they call *Cumbi* (according to Garcilaso, *Compi*): from this last they weave various curtains and hangings (aulea et peristromata) of most elegant workmanship, which last a long time, and in splendour do not yield to silk; nay, what is wonderful for barbarians, they are so neat in their weaving that the elegance is nearly equal throughout, nor is the web or woof ever apparent. The antient Peruvian monarchs kept up many works for weaving *Cumbi*, the principal artificers in which lived at Capachica, on the banks of the lake Titicaca. These wools they dyed with the juice of various herbs, according as the nature of the work required. But most of the Peruvian barbarians are cunning in this weaving, and have in their huts instruments adapted for the art; and from these sheep they draw most of the necessaries of human life. By far the greatest use of these animals however is in carrying burthens; for sometimes 300, sometimes a drove of 1000, carry various articles of merchandise, skins of wine, chocolate (cocam), maize, *Chunno*, and quicksilver to Potosi and the other mines and towns.' Acosta then speaks of their employment in conveying silver from Potosi, &c., and observes that he has often wondered how droves of these animals, sometimes consisting of 1000, sometimes of two only, and not unfrequently laden with 3000 bars or plates (laminæ) of silver, worth 3000 ducats, should make their way, accompanied by a few barbarians only, who direct them, and load and unload their burthens, and hardly attended by one or two Spaniards, passing the night in the open air and without a guard,—and that so safely that a bar is scarcely ever missed, such is the security of travelling in Peru. 'The burthen of each beast,' continues Acosta, 'amounts to 100 and sometimes 150 lbs., which they carry three, or at the most four, leagues a-day, according to the length of the journey. But their leaders know their stations, where food and water for their cattle abound: here they pitch their tents, and unload their beasts. When however they have only one day's journey to make, the Llamas are able to bear a load of even 200 lbs., or to move forward as many as eight or ten leagues. These animals rejoice rather in a cool than in a fervid temperature, and therefore they are propagated immensely in the mountains, whilst they fail in the plains, on account of the too great heat. The bald sheep (calvum pecus), or Guanacoes, are of a fawning (vernile) and gentle aspect: often, as they walk along, they stop and regard the passers-by without any expression of fear or pleasure, so attentively with erected neck, that it is difficult to abstain from laughter; sometimes they are so suddenly terrified, that they run off to the mountain precipices with the greatest swiftness, so that it is necessary to shoot them to save their loads. The Pacoes also become so enraged sometimes, or are so wearied with their burthens, that they lie down with their burthens, and cannot be made to rise either by threats or blows; whence a proverb has arisen, and stubborn or obstinate men are said to be *Impacatos*. For this there is no better remedy than for the conductor to stop and sit down by the animal, until by his blandishments he prevails on the animal to rise spontaneously.'

It further appears that the Llamas are subject to scab, called by the 'barbarians' *carachen*, which is deadly not only to the animal which has taken it, but spreads by contagion among the flock, so that almost the only remedy is immediately to bury the diseased animal. Garcilaso however mentions other remedies: the most powerful is stated to be a very simple one, namely, anointing the affected parts with lard (adipe suilla). The price of a Llama varies in different provinces; but the 'barbarian' who possesses two or three is considered sufficiently rich. Garcilaso adds that the Peruvians, before the arrival of the Spaniards, did not milk their flocks, which give that secretion very sparingly, and only in sufficient quantity for their young; neither did they make cheeses of their milk.

De Laet then proceeds to state, that besides these domestic herds, Peru produces certain wild animals which are not easily to be seen in other parts of the New World, except in the neighbouring country of Chili. Some of these are called *Guanaco* or *Huanacu*, from a similitude to which the domestic kinds obtained the same name. The flesh of these is good, according to Garcilaso, but not so good as that of the domestic *Huanacu Llamas*. The males keep a look-out on the highest hills, whilst the females are feeding in the valleys; and when the former observe the approach of men from afar, they neigh almost like a horse, to warn the females. If the men come nearer, they flee, driving the females before them. The wool of these is short and rough, but it is notwithstanding used by the 'barbarians' for making cloth. These animals are taken in snares and nooses. Others again are called *Vicuñas*: these are not very unlike goats, except that they have no horns, and are larger, and are of a leonine colour or more ruddy; these live in the highest mountains and groves, and love the colder regions, but especially the solitudes which the Peruvians designate by the common name of *Punas*; neither are they annoyed by snow or frost, but are rather recreated thereby. They go in flocks, and run most swiftly. Such is their timidity, that at the sight of men or wild beasts they hurry instantly into inaccessible or hidden fastnesses. There were formerly a great number of these animals here, but they are now become much more rare on account of the promiscuous licence in hunting. Their wool is very fine, and like silk, or rather like the wool of the Beaver, and the natives deservedly estimate it highly; for besides other properties it is also said to resist the heat and impart coolness, whence it is especially used for caps. Next to these come the *Tarugas* or *Tarucas*, which are larger and more swift than the Vicuñas, and of a more burnt colour, with pendulous and light ears: they rarely collect in herds, and generally wander about the precipices singly. Garcilaso says that these are a species of deer, but less than those of Europe. They were innumerable in the time of the Yncas, so that they entered the very towns; nor was there any deficiency of their fawns and does. Thus far De Laet, who says that all these animals produce bezoar stones, of which those of the *Pacoes* and *Guanacoes* are the smallest and lowest in estimation, whilst those from the *Vicuñas* are rather larger and better, and those of the *Tarugas* the best of all.

We now turn to Hernandez. We find in the Roman edition (fol. 1651) a figure of the '*Pelon Ichiatl Oquitli* Ovis Peruviana,' with a description. Both figure and description leave no doubt that the brown Llama is the animal represented. There is a very long commentary, well worth the attention of the curious reader. Of this '*Aries* sive *Ovis Peruviana*,' two kinds are mentioned: the first like the animal represented; the other small and stunted (parvæ et pygmææ), with short legs, but strong and able to carry domestic burthens, such as water, corn, &c. Another kind, the *Pacos*, are stated not to be so corpulent. In the catalogue of Hernandez the *Pelon Ichiatl Oquitli* is called *Peruichatl*.

Marcgrave gives a figure of the long-wooled and large *Llama*, under the name of *Ovi-camelus*. In some parts it is not bad; in others, the muzzle and fore-feet for instance, it is monstrous. He says that the larger kind of *Ovi-camelus* is called *Paco*. His description is worth consulting: he says, among other statements, that they bore the ears of these 'sheep,' and run ropes through them, by which their masters manage them and lead them where they please. He then gives another figure, much better executed than the other, of a second species, which is nearly naked with regard to fleece, and is only covered by a light and short one (calvum pecus of De Laet?); and says that it partly resembles a camel and partly a deer, so that it might be well called in Greek ἐλαφοκάμηλος—Elaphocamelus.

We gather then from these and other early writers, that there were three kinds of these animals, *Guanacoes* or *Huanacoes*, *Pacoes*, and *Vicuñas*, the term *Llama* being applicable to each of them, and merely signifying cattle or sheep; but these kinds are by no means clearly defined. 'In the last half century,' says Mr. Bennett, 'the great majority of naturalists, including Ray, Klein, Brisson, and Linnæus, concurred in reducing them to two species, the *Llama* or *Guanaco*, commonly used as a beast of burthen, and the *Paco* or *Vicugna*, cultivated for its flesh and its wool. Of this opinion was Buffon when he wrote the history of the Llama and the Paco; but the observation of living specimens of the Llama and the Vicugna, and the communications of the Abbé Béliardy on the subject, induced him afterwards to admit the latter animal as a third species distinct from the preceding. In this he was followed by Molina, who, in his 'Natural History of Chili,' separated also the Guanaco, and added a fifth species, the Hueque or Chilian sheep of the older authors. Gmelin, Shaw, and almost every subsequent compiler, have adopted these five species without examination, giving to them such synonyms as they could pick up almost indiscriminately from the writers on the natural history of America, and thus creating a mass of confusion which it would be both vain and useless to attempt to unravel.' (*Gardens and Menagerie of the Zoological Society.*)

Pennant gives as species the *Llama*, the *Vicuña*, the *Paco*, the *Guanaco*, and the *Chilihueque*, but gives figures of the first two only.

M. F. Cuvier makes the number of species three—the Llama, the Paco, and the Vicuña; M. Lesson gives the same; Dr. Fischer records the same three and a fourth, *Auchenia Arucana* (Chilihueque) as doubtful. In his denda et emendanda he notices *L. Huanaca* (Auche

Huanaca, Hamilt. Smith; *Cervocamelus* of Jonston) with a query if it is not a mere variety of *L. Peruana*. As a synonym to *Lama Puco* he adds *Auchenia Puco* (Hamilt. Smith), *Camelus Guanaco* (Traill). To *Lama Vicuña* he adds *Auchenia Vicugna* (Hamilt. Smith), less than the former; and to *Lama Arucana*, *Auchenia Arucana* (Hamilt. Smith).

Mr. Bennett observes that it seems to be the general opinion among the leading writers of the present day that the subdivision of the genus has been carried to too great an extent. He thinks that M. F. Cuvier is fully justified by the imperfect accounts of Molina in rejecting as species the *Guanaco* and the *Hueque* of that writer. Mr. Bennett states that he should have little hesitation in proceeding still further, for he is strongly inclined to agree with Baron Cuvier in regarding the *Paco* as a mere variety of the *Llama* with the wool more amply developed; and in considering the *Vicuña* as the only animal of the group that deserves to be specifically distinguished from the latter. Skeletons of both the Llama and Vicuña are preserved in the Museum of the College of Surgeons, London.

Geographical Distribution.—The Cordillera of the Andes, below the line of perpetual snow. Peru (but not in Mexico) and Chili principally, though now much reduced in numbers; in Columbia and Paraguay they are more rare. Most of the navigators to the Straits of Magalhaens and south-western coasts of America mention Guanacoes from early times down to the expeditions under Captain King and Captain Fitzroy inclusive, and the flesh of these animals has afforded a salutary refreshment to the crews.

Habits, Food, Reproduction, &c.—The habits of the Llamas may be in great measure gathered from the descriptions of the Spanish writers above given. In a wild state they keep together in herds, sometimes of one or two hundred, feeding on a sort of rushy grass or reed called *yaho*, which grows on the mountains, and, it is said, never drinking when they have sufficient green herbage. They resort to a particular spot to drop their dung, which a good deal resembles that of a goat, sheep, or giraffe, a habit which is often fatal to them from betraying their haunts. Modern observers have noticed the careful look-out that they keep, and the rapidity with which they flee, then turn to gaze, and again swiftly gallop off. Molina says that the Guanacoes leave the mountains, where they passed the summer, at the beginning of winter, when they descend to the plains. Here they are hunted down, at least the young and inactive, with dogs by the Chilians. During the chace they are said frequently to turn upon their pursuers, neigh loudly, and then take to their heels again. Another mode of capturing them by the Indians is for many hunters to join and drive them into a narrow pass, across which cords have been drawn about four feet from the ground, with bits of cloth or wool tied to them at small distances, somewhat in the way adopted by gardeners to keep small birds from the seeds. This apparatus with its pendent trumpery frightens the animals, and they get together, when the hunters kill them with stones tied to the end of leathern thongs. If there are any Guanacoes among them, they leap the cords and are followed by the Vicuñas. Those that we have seen in captivity have been tolerably mild and tame, but very capricious, accepting biscuits and such delicacies from visitors, but ejecting a copious shower of saliva in their faces at the least real or fancied affront. This shower, though sufficiently unpleasant, has not, as far as our experience goes, the acrid and blistering properties ascribed to it by some authors. Genitale masculum tenue est, et recurvum. Est autem luxuriosum valde, et turpius in exercendo venereo actu, quam ullum mundi animal. Fæmina enim vulvam habet nimis parvam, quæ in terra jacens ita se componit, ut mas illi supervenire queat, qui tunc temporis gemitus specie maximè vociferatur, nec aliud tunc quasi fit, quam quod unum alterum conspuat, et non raro diem integrum consumant, ante quam actum ipsum venereum incipiant et absolvant. To the general truth of this account of the commentator on Hernandez we can bear testimony. The female, which has only two teats, is said to go six months with young.

Utility to Man.—We need not here repeat those uses to which these animals have been applied by man. Cords and sacks, as well as stuffs for ponchos, &c., are fabricated from the wool[*], and the bones are converted into instruments for weaving the same. Nor is even the dung neglected, for it is used as fuel. In short, these animals seem to have been to the aborigines what the reindeer (with the exception of the milk) is to the Laplander. Surrounded by herds of such animals which required almost no care, and by the spontaneous productions of the soil, the Indian had no incentive to improvement. Humboldt has an eloquent passage on this subject. 'When we attentively examine this wild part of America, we seem to be carried back to the first ages when the earth was peopled step by step; we appear to assist at the birth of human societies. In the Old World, we behold the pastoral life prepare a people of huntsmen for the agricultural life. In the New World, we

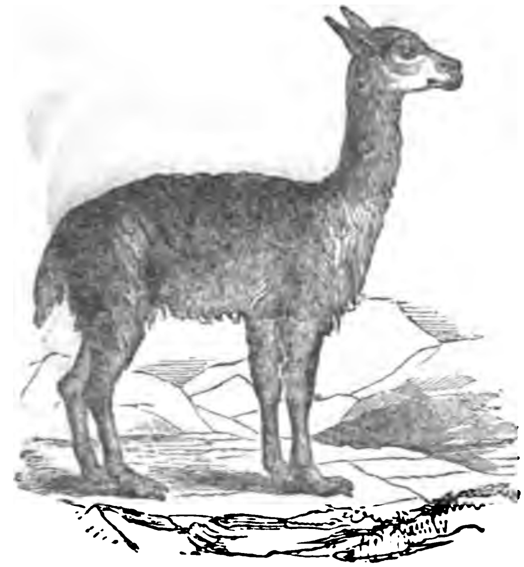
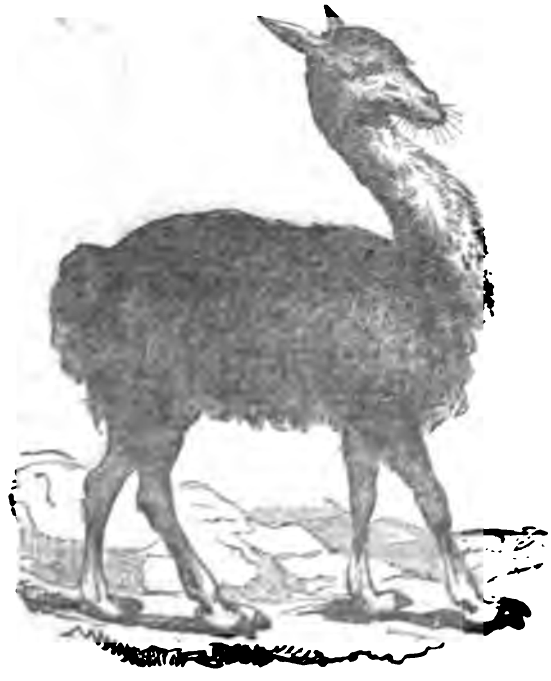
[*] In reference to the wool we may here state, that a herd of 36, including the kinds called Llamas, Alpocas, and Vicunas or Vigonias, were sent from Lima (Peru) and Concepcion (Chili) to Buenos Ayres by journeys of two or three leagues. To those who may be inclined to import these animals it may be necessary to state that they were fed during the journey with potatoes, maize, and hay: as soon however as the potatoes were exhausted, constipation came on so obstinately that medical relief was required. They were shipped as a present from Godoy, the Prince of the Peace, to the Empress Josephine, but only eleven arrived at Cadiz in 1808, just as Godoy fell into disgrace. Here two died, and indeed the rest were near being thrown into the sea by the infuriated rabble, in their detestation of the late minister and minion. The poor Llamas were however saved from the tender mercies of the populace by the governor of Cadiz, and were consigned to Don Francisco de Theran of Andalusia, who had a fine menagerie at San Lucar de Barrameda. When the French occupied the province, Marshal Soult protected them, and M. Bory St. Vincent, who was with the army, studied their habits and executed drawings of them, which were lost at the battle of Vittoria. M. Bory paid great attention to their wool, and some from each of the kinds was sent to the Academy of Sciences at Paris. From the report of the French naturalist and the philosophical Spaniard, it would appear that the fleece of the Alpa-vigonia (produced by a cross between a Vigonia and an Alpaca) has much greater length than that of any other variety and is six times heavier.

See 'The Menageries,' vol. i., published by the Society for the Diffusion of Useful Knowledge, where much interesting information is collected.

look in vain for these progressive developments of civilization, these moments of repose, these resting-places in the life of a people. . . . Those species of ruminating animals which constitute the riches of the people of the Old World are wanting in the New. The bison and the musk-ox have not yet been reduced to the domestic state; the enormous multiplication of the Llama and the Guanaco have not produced in the natives the habits of the pastoral life.' These multitudes are already lessened, and the form itself will probably ere long be extinct. Civilization has brought with it the animals of the Old Continent. The horse and the mule have almost entirely superseded the Llamas as beasts of burthen, and the sheep and the goat, in great measure, as contributors to the food and raiment of man.



Vicuna. (Buffon.)



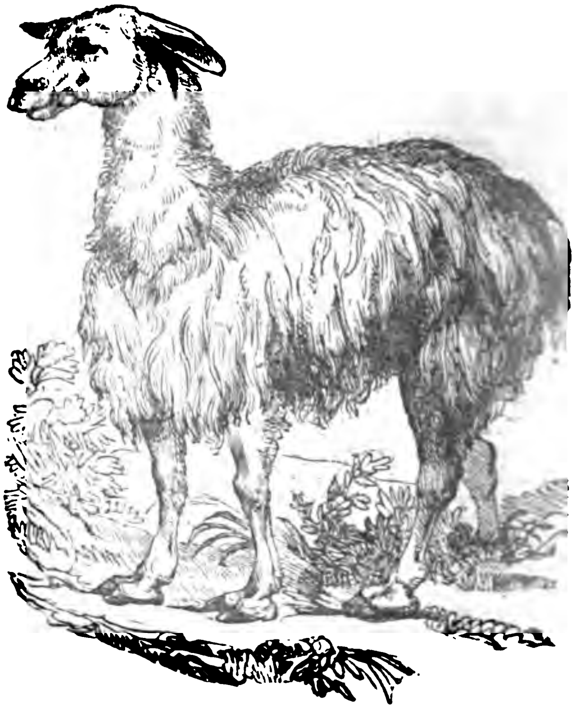
Brown Llama, exhibited in England.

The white Llama, according to Feuillée, is said to have been the presiding deity of the natives of [illegible], before that province was annexed to the empire of the Yncas.

ARRANGEMENT.

The similarity to the Camel appears to have struck every ter who has treated of the Llama.

nnæus places the genus *Camelus* at the head of his



White Llama, exhibited in England.

Pecora, and makes *Glama* and *Pacos* species of that genus *Camelus* is followed by *Moschus*.

Pennant also arranges the *Llama* and *Pacos*, &c., un his genus *Camel*, which is placed between the *Musk* a the *Hog*.

Gmelin retains the Linnean arrangement, adding th (so called) species to those recorded by Linnæus.

Cuvier places the great genus *Camelus* at the head the *Ruminants*, and makes it consist of the Camels prop so called and the *Llamas* (Auchenia). *Camelus* is foll by *Moschus*.

Mr. Gray makes his subfamily *Camelina*, the third family *Bovidæ*, consist of *Camelus* and *Auchenia*.

M. Lesson arranges the Llamas as the third genus of *Camelées*, the two first being *Camelus* and *Mericother* This third and last genus is immediately succeeded by *Moschinées*.

Dr. Fischer, following Linnæus, places *Camelus* at head of the *Pecora*; that genus is followed by *Lama*; a *Lama* by *Moschus*.

Mr. Swainson (1835) makes the '*Solipedes*, single-h quadrupeds,' his fifth tribe of *Ungulata*, consist of genera *Camelus*, *Auchenia*, and *Equus*.

Mr. Ogilby (1836) gives the *Camelidæ* as the first f of the order *Ruminantia*, with the following characters:—

Fam. 1. Camelidæ.

Feet subbisculcate, callous beneath, toes distinct at tip from the sole; no spurious hoofs, no horns; in- *teeth*, two above, six below.

2. Genera.

1. *Camelus*, whose characters are—
   Toes conjoined, immoveable.
   Muzzle furnished with a *chiloma*,* the upper (labrum) divided.
   Lachrymal Sinuses, none.
   Interdigital Pits, none.
   Inguinal Follicles, none.
   Teats, four.
2. Auchenia.
   Toes disjoined, moveable.
   Muzzle furnished with a *chiloma*, the upper divided.
   Lachrymal Sinuses, none.
   Interdigital Pits, none.
   Inguinal Follicles, none.
   Teats, two.

Mr. Ogilby goes on to state that the Camelidæ f what Mr. MacLeay would call an aberrant group;

---

* Tumid upper lip continuous with the nose or muzzle.

differ essentially, observes the former, from other Ruminants in the structure both of the organs of locomotion and of mastication, and their generic distinctions consequently depend upon characters which have no application to the remaining groups of the order. On the other hand, the principles of generic distribution which subsist among the rest of the *Ruminantia* appear, in Mr. Ogilby's opinion, to furnish negative characters only when applied to the *Camelidæ*; but though necessarily expressed negatively, the absence of lachrymal, inguinal, and interdigital sinuses forms, in reality, positive and substantial characters, and as such, should be introduced into the definition of these, as well as of other genera, in which they unavoidably appear in a negative form. The *Camelidæ*, in Mr. Ogilby's arrangement, are immediately followed by the *Cervidæ*. (*Zool. Proc.*, 1836.)

⁂ No fossil species of *Auchenia* has yet been discovered; but Mr. Darwin brought home from South America the remains of a most interesting animal nearly allied to the *Llamas*, which Mr. Owen has characterized under the name of *Macrauchenia*. [MACRAUCHENIA.] The cervical vertebræ in this form present the same character in the absence of the holes for the vertebral arteries in the transverse processes as in the Llamas and Camels. (Owen.)

LLANGOLLEN. [DENBIGHSHIRE.]

LLANOS. [PLAINS.]

LLANRWST. [DENBIGHSHIRE.]

LÔ, ST., a town in France, capital of the department of Manche, 152 miles west by north of Paris in a straight line, or 171 miles by the road through Evreux, Lisieux, and Caen. The origin of this town is doubtful. It stands on the river Vire, and is irregularly built: it has a fine 'place,' or open space. There are four parish churches, of which that of Notre Dame is the principal. The church of Ste. Croix is in the Norman style, of which it is considered to be the best preserved specimen in France. The prefect's office, lately erected, the town-hall, the courts of law, and the prison, are the chief public buildings. The population, in 1831, was 8154 for the town, or 8421 for the whole commune; in 1836 it was 9065 for the commune, showing an increase in five years of 644, or about seven and a half per cent. The chief manufactures are of fine woollen cloths, serges, druggets, and woollen shawls; bed-ticks, calico, lace, and tape; woollen and cotton yarn; leather, common cutlery, and iron goods. There are slate-quarries in the neighbourhood. The chief trade is in the above manufactures; iron, salt butter, cider, honey, corn, cattle, horses, and poultry. There are eight well-frequented fairs in the year. There are a Society of Agriculture and Commerce, a high school, a public library of 5000 volumes, an hospital, a theatre, public baths, and several government offices.

The arrondissement comprehends 436 square miles, and had, in 1831, a population of 99,250; in 1836, of 100,717. It is subdivided into nine cantons and 120 communes.

LOACH. [COBITIS.]

LOADSTONE. [IRON—*Ores*.]

LOAM, a soil compounded of various earths, of which the chief are siliceous sand, clay, and carbonate of lime, or chalk. The other substances which are occasionally found in loams, such as iron, magnesia, and various salts, are seldom in such proportions as materially to alter their nature. Decayed vegetable and animal matter, in the form of humus, is often found in loams in considerable quantities, and the soil is fertile in proportion.

According as the loams are composed, so they vary in quality. Those which consist of a great portion of loose sand, with little humus, and with an impregnation of iron, are very unproductive; and those which contain too much clay, and are on an impervious subsoil, are very difficult to cultivate. But between these extremes there are soils which cannot be surpassed in fertility as wheat-land. What renders loams so much more fertile than either clays or sands is, that the pure earths are in themselves almost entirely barren: sand lets the moisture run through it and evaporate rapidly; clay retains it, but locks it up in its own substance, and does not allow the tender young roots of plants to push through it; chalk has the same mechanical quality, besides containing very little organic and soluble matter, from which plants derive their chief increase. Sand and clay alone, without a considerable portion of humus, will not make a rich soil; but when a portion of calcareous earth is joined to both, the humus is more readily rendered soluble, and the clay and sand are prevented from forming a mortar, which would harden excessively, and prevent the influence of the air from reaching the roots. Good loams allow of that circulation of moisture which acts so prominent a part in the process of vegetation. It is almost universally admitted that the most fertile soils always contain a proportion of calcareous matter; and by adding chalk to those soils in which it does not abound, whether sandy or argillaceous, a manifest improvement is always produced.

It has been asserted that in the climate of France, in the neighbourhood of Paris, the best soil for the growth of wheat is composed of equal portions of fine sand, clay, and chalk. Upon what ground this is assumed, does not appear very clear. The greater the natural moisture of any climate, the greater proportion of sand is required to make a fertile loam; and the greater the proportion of humus, the less sand will be required to temper the clay. The analysis of soils known to be extremely fertile gives a very great difference in the proportions of the different earths.

In the climate of England the soil which is generally preferred for cultivation is a loam, rather light than heavy; at least half of which is siliceous sand, one-third clay, and the rest chalk. Such a soil is called a good loam; it is land which will produce almost every thing which is usually cultivated on sands or clays; it is not too stiff for carrots and turnips, and not too loose for wheat and beans. It is of most easy cultivation at all times of the year, provided the subsoil be sound, and not too retentive of water. It requires only to be occasionally recruited with manure, to restore to it the humus which vegetation has consumed, and to be kept free from the weeds which naturally spring up in all fertile soils. All attempts to improve the nature of a soil should have for their object the bringing it to a state of loam, by the addition of those substances which are deficient. If there is too much clay, chalk and sand may be added, or a portion of the clay may be calcined by burning, in order to destroy its attraction for water, and thus act the part of sand in forming the loam. Limestone or calcareous sand and gravel are still more efficacious for this purpose: they not only correct too great porosity, or too great tenacity, but also act chemically on the organic matter in the soil, rendering the humus soluble, and fit to be taken up by the roots of plants. If there is too much sand, marl composed of clay and chalk is the remedy. Good loams require much less tillage than stiffer soils, and will bear more stirring to clean them than sands. Hence they are cultivated more economically, and more easily kept free from useless weeds; while the produce is more certain and abundant. They can be impregnated to a higher degree with enriching manures, without danger of root-fallen crops, or of too great an abundance of straw at the expense of the grain. For artificial meadows they are eminently proper; all the grasses grow well in good loams, when they are on a dry or well-drained subsoil, which is an indispensable condition in all good land. Sheep and cattle can be depastured on them during the whole year, except when there is snow on the ground. If there should be means of irrigation, no soil is better suited to it than a light loam on a bed of gravel; or even if the subsoil is clay, provided sufficient under-draining prevent the water from stagnating between the soil and subsoil, which, as practical men very properly express it, would poison any land.

A loamy soil requires less dung to keep it in heart than either clay or sand; for while it is favourable to the process by which organic matter buried deep in the soil is converted into insoluble humus, it also permits that part of it which is nearer to the surface to attract oxygen from the air, and that it is converted into a soluble extract, which is to the roots of plants what the milk of animals is to their young—a ready-prepared food easily converted into vegetable juices.

The analysis and classification of soils is of the greatest importance to all those who take farms; for the rent of land is very seldom proportioned to its intrinsic value: one farm may be worth double the rent of another, where the apparent difference in the soil is very trifling. Those who have had long experience of the expense of cultivation, and the average produce of certain lands, can nearly guess what rent it may be safe to offer; but a stranger has no criterion to judge by. Hence it is notorious that a stranger coming to take a farm from a distant district is almost invariably deceived. Why should not the value of a soil be ascertained as readily as that of any article of commerce? If there were certain points of comparison, it would be so; but in this the theory of agriculture is wofully deficient. A man guesses at the qualities of land by the colour, the feeling, and other uncertain signs: it seldom or never occurs to a farmer to examine the component parts of a soil, by merely diffusing a portion in water, and testing the deposits—much less to compound artificial soils, and compare them with those found in the fields. Yet every gardener can prepare soils suited to different plants, and make loams of all degrees of richness or consistence. In all these it will be found that sand, clay, chalk, and decayed vegetable substances, in various proportions, are the chief ingredients. If therefore these are found in a natural loam, we may safely conclude that it will be equally productive, and the deficiency of any one ingredient may be supplied artificially. This would be going rationally and scientifically to work; and the result would be a more certain and satisfactory practice of husbandry.

It might be an interesting and highly useful inquiry to ascertain the effect of the contact of various kinds of earth, moistened with water, in exciting galvanic action, which no doubt greatly influences the chemical affinities of the elements from which the plants derive their increase. It is a subject which has scarcely ever been noticed, and we would strongly recommend scientific experiments in this branch of vegetable physiology.

LOANGO, on the west coast of Africa, is the most northern of the four countries or districts which are said to have antiently constituted the kingdom of Congo, as explained in the articles CONGO, ANGOLA, and BENGUELA. In the first-mentioned of these articles there is an enumeration of the chief authorities from which we derive our information respecting all these countries.

Loango extends along the coast from Cape Lopez Gonsalvo in 0° 44′ S. lat. to the river Congo or Zaire, which separates it from Congo in about 6° S. lat. To the north it is said to be bounded by Gabon, or Pongo, and to the east by the country called Mokoko, or Anziko. Pigafetta, on the information of Duarte Lopez, extends its limits into the interior about 200 miles from the coast.

According to Olferd Dapper, Loango, or Loangego, as he writes the name, was antiently only one of the divisions of the territory properly so called, others being Mayomba, or Majumba, Kilongo, Piri, and Wansi. Other early accounts describe the principal provinces of the kingdom of Loango as being Loangiri, Loangomongo, Kilongo, and Piri. To these others add Sette, Gobbi, and other districts.

Loango, the capital town, called by the natives Banza Loangiri, is in the province of the same name, which occupies the south-western angle of the country. It stands in a large plain, at the distance of three miles from the sea. It is described both by Battel and Dapper, and the latter also gives an engraved representation of it. Here, among other buildings is or was attached to the royal palace the dwelling of the king's wives, stated to be five hundred in number. The reigning king in Battel's time (1589—1607) had four hundred children.

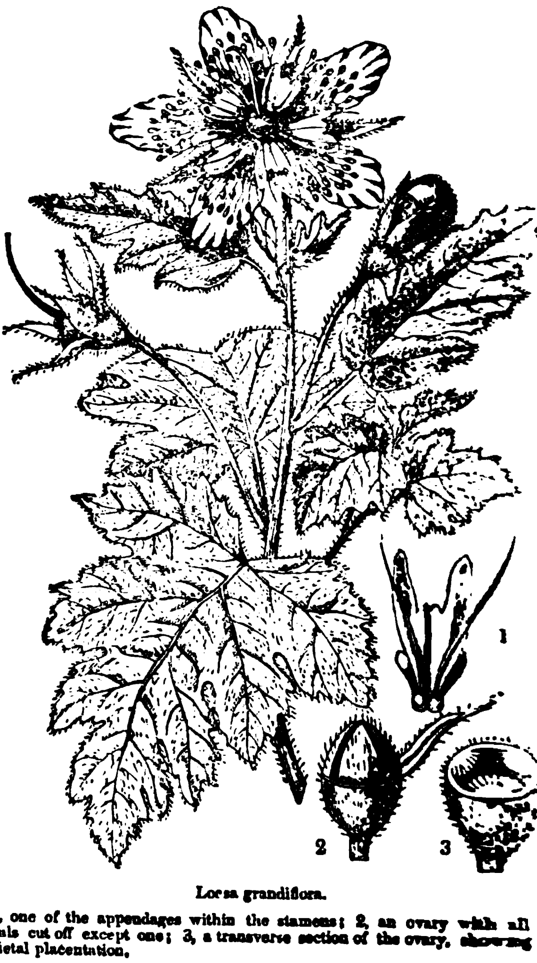
Another account gives the king seven thousand wives, one of whom occupies a very extraordinary position, having, it is affirmed, the right of directing the entire public conduct of the king, and of taking his life if he refuse to obey her commands. Nay, although married to the king, she may choose any other man she pleases for her lover, and all the children she produces are still accounted of the blood royal. At the same time it is death for her gallant to be surprised in the embraces of another woman. This highly privileged lady is nominated by the king himself to the post she fills, and is known by the name of the Makonda.

The government, like that generally prevalent among the barbarous tribes of this part of Africa, is the most absolute species of despotism. Battel states that the kings of Loango are believed by their subjects to be divinities, and that the titles by which they are known, Samba and Pango, have that signification in the language of the country. In particular, they are held to have the power of bringing down rain from the sky; and this useful prerogative they exercise every year, on the petition of their subjects, with great ceremony. On one occasion when Battel was present, an abundant shower fell on the afternoon of the same day on which the king, seated on his throne, and surrounded by the admiring multitude, had issued the usual command to the heavens by hurling a spear into the air; a circumstance which excited the sentiment of the national superstition to a wonderful pitch of enthusiasm. The successor to the throne is the king's next eldest brother, or, if he have no brother, the eldest son of his eldest sister. Although the king however is independent of the nobles, the latter in their own sphere appear to exercise unlimited tyranny over the common people. The religion of the country is an idolatry of the most superstitious character.

A great part of the country is covered with thick woods, and it is only mountainous in the interior towards the south. In the north it possesses some lakes of considerable extent, from which, and from the mountains, many rivers descend to the sea. Among these however there are none of much magnitude, with the exception of the Banna, at the mouth of which stands the town of Mayomba, about six miles south from Cape Negro, or nearly in 3° 30′ S. lat.

The sea contains fish in abundance, which form a great part of the sustenance of the people; the produce of the soil, which is said to yield three harvests in the year, with very little cultivation, consists of various kinds of grain, such as are raised in the adjacent regions. Among the trees are some dyeing woods. The only mineral found in the country seems to be iron. The principal animals that are mentioned are elephants and apes, both of which were formerly very numerous.

LOASA'CEÆ, a small natural order of polypetalous Exogens, consists of herbaceous and frequently annual plants covered over with stiff hairs or stings, which produce considerable pain by the wounds they inflict. They have alternate lobed leaves without stipules, large yellow, red, or white flowers, numerous polyadelphous stamens, within which are stationed singular lobed petaloid appendages, and an inferior ovary with parietal placentæ. The fruit is a dry or fleshy capsule, with the valves sometimes twisted spirally. The order is nearly allied to Cucurbitaceæ; all the known species are American, and the greater part from Chili and Peru. The genera in gardens are Loasa, Mentzelia, and Blumenbachia.



Loasa grandiflora.

1, one of the appendages within the stamens; 2, an ovary with all the sepals cut off except one; 3, a transverse section of the ovary, showing the parietal placentation.

LOBA'RIA. [BULLÆA, vol. vi., p. 11.]

LOBEI'RA, VASCO. [AMADIS DE GAULA.]

L'OBEL, or LOBEL, MATTHEW, one of the founders of the science of systematic botany, was born in Flanders, in the year 1538, travelled in various parts of the middle and south of Europe, and finally settled in England, where he became physician to James I. He is chiefly known now as the author of botanical works illustrated by great numbers of figures, of which there are above 2000 in his 'Plantarum Historia,' a folio work published at Antwerp, in 1576, and still referred to by critical writers on systematic botany. But his name deserves mention more particularly as that of the first naturalist who devised the present method of arranging plants in their natural orders, rudely indeed, but with sufficient distinctness. In his 'Stirpium nova adversaria,' published in London in 1570, and dedicated to Queen Elizabeth, he expressly mentions Gramineæ, Acori, under which Irideæ and Zingiberaceæ are included, Asphodeleæ, Satyria or Orchideæ, Atriplices or Chenopodiaceæ, Brassicæ or Cruciferæ, Glaucia or Papaveraceæ, Labiatæ, Asperifoliæ, Leguminosæ, and some others. Lobel died at Highgate, near London, in 1616. The genus Lobelia was dedicated to him by Linnæus.

LOBE'LIA INFLA'TA, or Indian tobacco, an annual plant, growing in most districts of North America, of which the oval-oblong leaves are used in medicine. They have an undulated and irregularly toothed margin, rough surface and slightly pilose below, possessing a taste which gradually becomes acrid and pungent. The inflated capsules possess the same virtues.

The action on the human system is nearly the same as that of tobacco when chewed, producing a copious flow of saliva, and if swallowed in considerable dose causing great relaxation of all muscular structures, including the heart and arteries, accompanied with debility and cold perspirations, and also paleness of the surface. In large doses it proves decidedly poisonous. It frequently acts as an emetic and expectorant when given in small and regulated doses.

It has been found eminently useful in warding off or cutting short a paroxysm of asthma, either taken internally in substance, or in the form of an ethereal tincture, or inhaled as smoke along with aromatic herbs. It has been found beneficial as an expectorant and relaxant in hooping-cough, but neither in it nor asthma does it prove more than a palliative, or afford more than temporary relief; as such however it is very serviceable in some nervous affections with irregular action of the heart.

LOBELIA'CEÆ, an important natural order of monopetalous *Exogens*, differing from Campanulaceæ in having irregular flowers and syngenesious stamens, but otherwise resembling them very nearly; of these two characters the last is the most absolute, Isotoma, a Lobeliaceous genus, being so called because its flowers are regular. The species principally inhabit the warmer parts of the world; in Europe they are rare, in North America much more common, especially in the southern states, and they are abundant in the hotter countries of South America. Many are found at the Cape of Good Hope, and in the north of India; their favourite haunts being damp woods or situations freely supplied with moisture. They abound in a milky juice, which in all is acrid, and in some so intensely so as to produce dangerous or even fatal consequences when applied to the surface of the body or taken internally. Among the most virulent is the Hippobroma longiflorum, a West Indian species, and the Lobelia Tupa, a Chilian plant now common in gardens. Nevertheless certain species have proved, in skilful hands, valuable curative agents, especially the *Lobelia inflata*, or Indian tobacco. Many of the plants of this order are cultivated in gardens for the sake of their brilliant blue or scarlet flowers: white and yellow are rare in the order.

LOBIPES, Cuvier's name for a genus of Wading Birds (family *Longirostres*, Cuv.), the type of which is *Tringa hyperborea*, Linn. The genus is identical with *Phalaropus* of Vieillot.

LOBO, JEROME, a native of Lisbon, entered the order of the Jesuits, and became professor in their college at Coimbra, whence he was ordered to the missions in India. He arrived at Goa in 1622, and after remaining there about a twelvemonth he volunteered for the mission to Abyssinia. The sovereign of that country, whom Lobo calls Sultan Segued, had turned Catholic through the instrumentality of Father Paez, who had gone to Abyssinia in 1603. The connexion between Abyssinia and Portugal had begun nearly a century before, when the Negus, or emperor David, having asked the assistance of the Portuguese against the Moors of Adel, Don Christopher de Gama, one of the sons of the discoverer Vasco de Gama, was sent from India with 400 men to Abyssinia. [ALVAREZ, FRANCISCO.]

Lobo sailed from Goa in 1624, and landed at Paté, on the coast of Mombaza, thinking of reaching Abyssinia by land. The empire of Abyssinia then extended much farther south than it does at present; and this route was considered by the Portuguese in India as preferable to that by the Red Sea, the coasts of which were in the hands of the Turks. Lobo proceeded some distance from Paté to the northward among the Gallas, of whom he gives an account, but finding it impracticable to penetrate into Abyssinia by that way, he retraced his steps to the coast and embarked for India.

In the following year (1625) he sailed again with Mendez, the newly appointed patriarch of Ethiopia, and other missionaries. This time they sailed up the Red Sea and landed at Beilur, or Belul Bay, 13° 14′ N. lat., on the Danakil coast, whose sheik was tributary to Abyssinia, and thence crossing the salt plain he entered Tigré by a mountain-pass and arrived at Fremona near Duan, where the missionary settlement was. Here Lobo remained the remainder of that year, after which the patriarch proceeded to the emperor's court, but Lobo remained in Tigré, where he spent several years as superintendent of the missions in that kingdom. A revolt of the viceroy of Tigré, Tecla Georgis, put Lobo in great danger, for the rebels were joined by the Abyssinian priests, who hated the Catholic missionaries, and indeed represented the protection given to them by the emperor Segued as the greatest cause of complaint against him. The viceroy however was defeated, arrested and hanged, and Lobo, having repaired to the emperor's court, was afterwards sent by his superiors to the kingdom of Damot. He here introduces in his narrative an account of the Nile and its sources, 'partly,' he says, 'from what he had himself seen, and partly from what he had heard from the natives.' His account coincides in the main with the subsequent observations of Bruce and others. From Damot Lobo after some time returned again to Tigré, where the persecution raised by the son and successor of Segued overtook him. All the Portuguese, to the number of 400, with the patriarch, a bishop, and eighteen Jesuits, were compelled to leave the country in 1634. They put themselves under the protection of the Bahrnegash, by whom however they were given up to the Turks at Massowah, who demanded a ransom. Lobo was sent to India for the purpose, and he endeavoured strongly to persuade the Portuguese viceroy to send a squadron with troops to take possession of Massowah, but the viceroy had not the spirit nor perhaps the means to follow his advice, and referred him to Lisbon. Lobo sailed for Europe, but, as he himself says at the end of his narrative, 'never had any man a voyage so troublesome as mine, or interrupted by such a variety of unhappy accidents. I was shipwrecked on the coast of Natal, was taken by the Hollanders, and it is not easy to mention the dangers which I was exposed to both by land and sea before I arrived in Portugal.' Portugal was then under the king of Spain, and Lobo was sent to Madrid, where he found still more indifference with regard to Abyssinian affairs than he had experienced at Goa. Still engrossed by his favourite idea, that of reclaiming Abyssinia to the Catholic faith by means of Portuguese influence and arms, Lobo set off for Rome, but there also he found little encouragement.

In 1640 he returned to India, and became rector and afterwards provincial of the Jesuits at Goa. In 1656 he returned to Lisbon; and in 1659 he published the narrative of his journey to Abyssinia, under the title of 'History of Ethiopia,' which was afterwards translated into French by the Abbé Legrand, who added a continuation of the history of the Catholic missions in Abyssinia after Lobo's departure, and also an account of the expedition of Poncet, a French surgeon, who reached that country from Egypt, and a subsequent attempt made by Du Roule, who bore a sort of diplomatic character from the French court, but was murdered on his way, at Sennaar, in 1705. This is followed by several dissertations on the history, religion, government, &c., of Abyssinia. The whole was translated into English by Dr. Johnson in 1735. There had already appeared in

1675 a little work published by the Royal Society of London, said to be translated from a Portuguese MS., styled 'A Short Relation of the River Nile,' which is also found in Thévénot's collection, and the original of which is Lobo's. Many of the particulars coincide with those in the larger narrative. Lobo died at Lisbon in 1678. He was a man of abilities, enterprise, and perseverance, and altogether well qualified for the mission which he undertook.

LOBOPHY'LLIA. A portion of the animals included in Lamarck's genus Caryophyllia is thus named by Blainville. [MADREPHYLLIÆA.]

LOBSTER. [ASTACUS; CRUSTACEA; HOMARUS.]

LOBULA'RIA, a group of recent zoophyta, separated from the Linnæan Alcyonia. [ALCYONEÆ.]

LOCARNO. [TICINO.]

LOCHABER, a district of Scotland in the south-west of Inverness-shire, which takes its name from 'Lochaber,' a small lake in the vicinity of Fort William, which, according to Camden, was formerly written 'Loghuaber,' signifying the mouth of the lakes. The north-western boundary of this district is formed by Loch Eil, Loch Lochie, and the Caledonial Canal, while towards the south and south-west it is terminated by the shires of Perth and Argyle, from which it is partly separated by Loch Leven. The north-eastern boundary is formed by the district of Badenoch; but the natural limits in this direction are not distinctly defined, and moreover those given by different authorities are not quite in accordance. In the map of Inverness-shire published in the 'New Statistical Account of Scotland' the north-eastern boundary is nearly a straight line joining the southern extremity of Loch Ericht and the northern extremity of Loch Lochie, according to which the greatest length of the district, from north-west to south-east, does not exceed 32 miles, while its greatest width, between Lochs Lochie and Ericht, is about 20 miles; and as its form, as there given, is nearly triangular, the area must be about 320 square miles. But in the Map of Scotland published by the Society for the Diffusion of Useful Knowledge the district appears to extend as far north-east as Loch Spey; whereby its superficial extent is somewhat augmented.

LOCHES. [INDRE ET LOIRE.]

LOCI. [LOCUS.]

LOCK, MATTHEW, an English composer of great and deserved celebrity, was born in Exeter, and, as a chorister of the cathedral, was instructed in the elements of music by Wake the organist. He completed his studies under Edward Gibbons, a brother of the illustrious Orlando. The continuator of Baker's *Chronicle* tells us that Lock was employed to write the music for the public entry of Charles II.; shortly after which he was appointed composer in ordinary to that king. Assuming that he had reached his 25th year at the period of the Restoration, the date of his birth may be fixed at 1635. His first publication was under the title of *A Little Consort of Three Parts, for Viols or Violins*, consisting of pavans, ayres, sarabands, &c.; the first twenty for two viols and a base. In Playford's *Catch that catch can* are glees, &c., by Lock, and among them that agreeable piece of vocal harmony, *Ne'er trouble thyself about Times or their Turnings*.

Lock was the first English composer for the stage. He set the instrumental music in the *Tempest*, as performed in 1673; and in the same year composed the overture, airs, &c. to Shadwell's *Psyche*, which he published two years after, with a preface betraying strong symptoms of that irascible temper which subsequently displayed itself in very glaring colours; first in a quarrel with the gentlemen of the chapel-royal; and next, in his opposition to a plan proposed for a great improvement in musical notation by the Rev. Thomas Salmon, A.M., of Trinity College, Oxford. The abusive and bitter terms in which he expressed himself in a pamphlet, entitled 'Observations on a late Book called an Essay,' &c., which is an answer to Salmon's proposal, are at once a distinct proof of Lock's uncontrolled violent disposition, and either of his utter incapability of justly estimating a plan which would have proved highly beneficial to the art, or of his selfishness in opposing what he may have thought likely to militate against his personal interests. [CLEF.] His resistance, backed by his prejudiced brethren, was unfortunately successful, and an opportunity was lost of accomplishing with ease that which every year's delay renders more difficult to effect, though ultimately, and at no distant period, the amelioration suggested by the above-named mathematician, or a still more complete and decided one, will be forced on the professors of music.

Lock contributed much to the musical publications of his day. His sacred compositions, some of which appear in the *Harmonia Sacra*, and in Boyce's *Collection of Cathedral Music*, are quaint, though they show that he was a master of harmony. But his *Music in Macbeth* is that on which his fame was built, and which will float his name down the stream of time: 'it is,' says his biographer, in *The Harmonicon*, 'a lasting monument of the author's creative power, and of his judgment. If the age in which it was produced, the infantine state of dramatic music at that period, the paucity and imperfectness of instruments, and the humble condition of what was then called an orchestra, be all duly considered, his work will be described, not as "a spark," as Dr. Burney calls it, but as a blaze of genius, the brightness of which neither years nor comparison have been able to dim, and which, could it have been aided by the enlarged means so plenteously afforded in after-times, would now have shone with a splendour that has rarely been equalled in any age or country.'

Lock died in 1677, having a few years before become a member of the Roman Catholic church. As a consequence of his conversion, he retired from the king's service, and was appointed organist to the consort of Charles, who was of the communion adopted by the composer.

LOCKE, JOHN, was born at Wrington near Bristol, on the 29th August, 1632. By the advice of Colonel Popham, under whom Locke's father had served in the parliamentary wars, Locke was placed at Westminster School, from which he was elected in 1651 to Christ Church, Oxford. He applied himself at that university with great diligence to the study of classical literature; and by the private reading of the works of Bacon and Descartes, he sought to acquire that aliment for his philosophical spirit which he did not find in the Aristotelian scholastic philosophy, as taught in the schools of Oxford. Though the writings of Descartes may have contributed, by their precision and scientific method, to the formation of his philosophical style, yet, if we may judge from the simply controversial notices of them in the 'Essay concerning Human Understanding,' they appear to have exercised a negative influence on the mind of Locke; while the principle of the Baconian method of observation gave to it that taste for experimental studies which forms the basis of his own system, and probably determined his choice of a profession. He adopted that of medicine, which however the weakness of his constitution prevented him from practising.

In 1664 Locke visited Berlin as secretary to Sir W. Swan, envoy to the elector of Brandenburg; but after a year he returned to Oxford, where he accidentally formed the acquaintance of Lord Ashley, afterwards earl of Shaftesbury. Locke accepted the invitation of this nobleman to reside in his house; and from this time he attached himself to his fortunes during life, and after death vindicated his memory and honour. (*Mémoires pour servir à la Vie d'Antoine Ashley, Comte de Shaftesbury, tirées des Papiers de feu M. Locke, et redigées par* Le Clerc, *Biblioth. Choisie*, t. vii., p. 146.) In the house of Shaftesbury Locke became acquainted with some of the most eminent men of the day, and was introduced to the earl of Northumberland, whom, in 1668, he accompanied on a tour into France. Upon the death of the earl, he returned to England, where he again found a home in the house of Lord Ashley, who was then chancellor of the exchequer, and Locke was employed to draw up a constitution for the government of Carolina which province had been granted by Charles II. to Lord Ashley with seven others.

In 1670 Locke commenced his investigations into the nature and extent of the human understanding, but his numerous avocations long protracted the completion of his work. In 1672, when Ashley was created earl of Shaftesbury and made lord chancellor, Locke was appointed secretary of presentations. This situation he held until Shaftesbury resigned the great seal, when he exchanged it for that of secretary to the Board of Trade, of which the earl still retained the post of president.

In 1675 Locke was admitted to the degree of bachelor in medicine, and in the summer of the same year visited France, being apprehensive of consumption. At Montpelier, where he ultimately took up his residence, he formed the acquaintance of the earl of Pembroke, to whom he afterwards dedicated his 'Essay concerning Human Understanding.' In 1679 Locke was recalled to England by the earl of Shaftesbury, who had been restored to favour and appointed president of the council. Six months afterwards however he was again disgraced, and, after a short imprisonment in the Tower, was ultimately compelled to leave England in 1682, to avoid a prosecution for high treason. Locke followed his patron to Holland, where, even after the death of Shaftesbury, he continued to reside; for the hostility of the court was transferred to Locke, and notwithstanding a weak opposition on the part of the dean, his name was erased, by royal mandate of the 16th of November, 1684, from the number of the students of Christ Church. But the raucour of the court-party extended its persecution of Locke even into Holland, and in the following year the English envoy demanded of the States-general the delivery of Mr. Locke, with eighty-three other persons, on the charge of participating in the expedition of the duke of Monmouth. Fortunately Locke found friends to conceal him until either the court was satisfied of his innocence or the fury of persecution had passed away. During his residence in Holland he became acquainted with Limborch, Leclerc, and other learned men attached to the cause of free inquiry, both in religion and politics. Having completed his 'Essay concerning Human Understanding' in 1687, he made an abridgement of it, which was translated into French by Leclerc, who inserted it in one of his Bibliothèques. In that of 1686 he had already published his 'Adversariorum Methodus, or a New Method of a Common-place Book,' which was originally written in French, and was afterwards first published in English among his posthumous works. In the 'Bibliothèque' of 1688 appeared his Letter on Toleration, addressed to Limborch, which was soon translated into Latin, and published the next year at Gouda. On the Revolution of 1688, Locke returned to England in the fleet which conveyed the princess of Orange. In reward for his sufferings in the cause of liberty, Locke now obtained, through the interest of Lord Mordaunt, the situation of commissioner of appeals, with a salary of 200*l.* a-year. In 1690 his reputation as a philosophical writer was established by the publication of his 'Essay concerning Human Understanding,' which met with immense success. Independent of the merits of the work itself as an attempt to apply the Baconian method of observation and experience to establish a theory of human knowledge, many circumstances contributed to its success: among others, the personal celebrity of the author as a friend of civil and religious liberty, and the attempt made at Oxford to prevent its being read in the colleges, a measure which could not fail to have a contrary effect. Numerous editions passed rapidly through the press, and translations having been made of it into Latin and French, the fame of the author was quickly spread throughout Europe. In the same year Locke published a second letter on Toleration, in answer to an attack on his first letter by Jonas Proast, a clergyman of Queen's College, Oxford, as well as two treaties on Government. These essays were intended generally to answer the partisans of the exiled king, who called the existing government a usurpation, but particularly to refute the principles advanced in the 'Patriarcha' of Sir Robert Filmer, who had maintained that men are not naturally free, and therefore could not be at liberty to choose either governors or forms of government, and that all legitimate government is an absolute monarchy. The first essay is devoted to the refutation of the arguments by which Sir Robert supports these principles, and which are ultimately reduced to this, that all government was originally vested by God in Adam as the father of all mankind, and that kings, as the representatives of Adam, are possessed of the same unlimited authority as parents exercise over their children. In the second essay Locke proceeds to establish, what had been the leading dogma of the Puritans and Independents, that the legitimacy of a government depends solely and ultimately on the popular sanction or the consent of men making use of their reason to unite together into a society or societies. The philosophical basis of this treatise formed a model for the 'Contrat Social' of Rousseau.

The air of London disagreeing with Locke, who suffered from a constitutional complaint of asthma, he accepted the offer of apartments in the house of his friend Sir Francis Masham, at Oates in Essex, where he resided for the remainder of his life. In this retirement he wrote his third letter on Toleration, which called forth a reply from Locke's former antagonist on the subject; in answer to whom a fourth letter, in an unfinished state, was published after the death of Locke. In 1693 he first gave to the world his 'Thoughts upon Education,' to which likewise Rousseau is largely indebted for his 'Emile.' Though appointed one of the commissioners of trade and plantations in 1695, Locke still found leisure for writing. The treatise, which was published in this year, 'On the Reasonableness of Christianity,' was intended to facilitate the execution of a design which William III. had adopted to reconcile and unite all sects of professing Christians, and accordingly the object of the tract was to determine what, amid so many conflicting views of religion, were the points of belief common to all. This work being attacked by Dr. Edwards, in his 'Socinianism unmasked,' Locke published in defence of it a first and a second 'Vindication of the Reasonableness of Christianity,' &c. In 1697 Locke was again engaged in the controversy, in consequence of the publication of a 'Defence of the Doctrine of the Trinity,' by Stillingfleet, bishop of Worcester, in which the bishop had censured certain passages in the 'Essay concerning Human Understanding,' as tending to subvert the fundamental doctrines of Christianity. Against this charge Locke ably vindicated his Essay; and the controversy, after having been maintained for some time, was at length terminated by the death of Stillingfleet.

Locke's health had now become so impaired, that he determined to resign his office of commissioner of trade and plantations. He refused to receive a pension which was offered him, and which his services in the public cause had amply merited. From the time of his retirement he resided always at Oates, and devoted the remainder of his life to the study of the Holy Scriptures. Among others of his religious labours at this period, a 'Discourse on Miracles,' and 'Paraphrases, with notes, of the Epistles of St. Paul,' together with an 'Essay for the Understanding of St. Paul's Epistles by consulting St. Paul himself,' were published among his posthumous papers. These contained also the work, 'Of the Conduct of the Understanding,' and an 'Examination of Father Malebranche's opinion of Seeing all things in God.' He died on the 28th October, 1704, in the seventy-third year of his age.

The personal character of Locke was in complete harmony with the opinions which he so zealously and so ably advocated. Truly attached to the cause of liberty, he was also willing to suffer for it. Perfectly disinterested, and without any personal objects at stake in the political views which he adopted, he never deviated from modreation, and the sincerity of his own profession rendered him tolerant of what he believed to be the conscientious sentiments of others.

As a writer Locke has a happy facility in expressing his meaning with perspicuity in the simplest and most familiar language. Clearness indeed is the leading character of his composition, which is a fair specimen of the best prose of the period. His style however is rather diffuse than precise, the same thought being presented under a great variety of aspects, while his reasonings are somewhat prolix, and his elucidations of a principle occasionally unnecessarily prolonged. These are faults however which, though they may materially detract from the merits of his composition as a model of critical correctness, have nevertheless greatly tended to make his 'Essay concerning Human Understanding' a popular work.

A rapid analysis of this Essay is necessary to enable us to form a right estimate of the philosophical merits of Locke.

As all human knowledge ultimately reposes, both in legitimacy and extent, on the range and correctness of the cognitive faculty, which Locke designates by the term 'understanding,' Locke proposes to determine what objects our understanding is and is not fitted to deal with. With this view he proposes in the first place to inquire into the origin of ideas; in the next place, to show the nature of that knowledge which is acquired by those ideas, and its certainty, evidence, and extent; and lastly, to determine the nature and grounds of assent or opinion.

Before entering upon this investigation Locke gets rid of a supposition which, if once admitted, would render all such inquiry useless. The refutation of the theory of innate ideas and principles of knowledge is the subject-matter of the first book of the Essay. Generally, he observes, the common assent of men to certain fundamental principles may be explained otherwise than by the supposition of their being innate; and consequently the hypothesis is unnecessary. But, in particular, he denies that there are any such universal and primary principles as are admitted by all men, and known as soon as developed, for to these two heads he reduces all the arguments usually advanced in support of this hypothesis. Thus of speculative principles he takes the principles of contradiction and identity, and shows, by an inductive appeal to savages, infants, and idiots, that they are not universally acknowledged; and as to their being primary, he appeals to observation of the infant mind, as proving that they are far from being the first ideas of which the human mind is conscious. The principles of morals are next submitted to a similar examination; and lastly, he shows that no ideas are innate: for this purpose he selects the ideas of God and substance, which, by a like appeal to savage nations and children, he proves to be neither universal nor primary, and arrives at the conclusion that neither particular ideas nor general principles of knowledge or morals are antecedent to experience.

The only source of human knowledge is experience, which is two-fold, either internal or external, according as it is employed about sensible objects or the operations of our minds. Hence there are two kinds of ideas, ideas of sensation and ideas of reflection. Reflection might properly be called an internal sense. The latter are subsequent to the former, and are inferior in distinctness to those furnished to the mind through the sensuous impressions of outward objects. Without consciousness it is, according to Locke, impossible to have an idea; for to have an idea and to be conscious of it is the same thing. He accordingly maintains, at great length, against Descartes, that the mind does not always think, and that its essence does not consist in thinking.

Now all ideas, whether of sensation or reflection, correspond to their objects, and there is no knowledge of things possible except as determined by our ideas. These ideas are either simple, and not admitting of further reduction, or complex. The simple rise from the inner or outer sense; and they are ultimately the sole materials of all knowledge, for all complex ideas may be resolved into them. The understanding cannot originate any simple ideas, or change them, but must passively receive them as they are presented to it. Locke here makes the first attempt to give an analysis of the sensuous faculty, to refer to each of the senses the ideas derived from them separately, or from the combined operation of several. Thus light and colour are derived from vision alone, but extension and figure from the joint action of sight and touch. While the outer sense gives the ideas of solidity, space, extension, figure, motion, and rest, and those of thought and will are furnished by the inner sense, or reflection, it is by the combined operation of both that we acquire the ideas of existence, unity, power, and the like. In reference to the agreement of ideas with their objects, Locke draws an important distinction between primary and secondary qualities: the former belong really to objects, and are inseparable from them, and are extension, solidity, figure, and motion; the latter, which are colour, smell, sounds, and tastes, cannot be considered as real qualities of objects, but still, as they are powers in objects themselves to produce various sensations in the mind, their reality must in so far be admitted. Of the operations of the understanding upon its ideas, perception and retention are passive, but discerning is active. By perception Locke understands the consciousness or the faculty of perceiving whatever takes place within the mind; it is the inlet of knowledge, while retention is the general power by which ideas once received are preserved. This faculty acts either by keeping the ideas brought into it for some time actually in view, which is called contemplation or attention, the pleasure or pain by which certain ideas are impressed on the senses contributing to fix them in the mind; or else by repetition, when the mind exerts a power to revive ideas which after being imprinted have disappeared. This is memory, which is, as it were, the storehouse of ideas. The ideas thus often *refreshed*, or repeated, fix themselves most clearly and lastingly in the mind. But in memory the mind is oftentimes more than barely passive, the re-appearance of obliterated pictures or ideas depending on the will. Discerning, by which term he designates the logical activity of the intellect, consists in comparing and compounding certain simple ideas, or in conceiving them apart from certain relations of time and place. This is called abstraction, by means of which particular ideas are advanced to generals. By composition the mind forms a multitude of complex ideas, which are either modes, substances, or relations.

Locke then proceeds to show in detail how certain complex ideas are formed out of simple ones. The idea of space is got by the senses of sight and touch together; certain combinations of relations in space are measures, and the power of adding measure to measure without limits is that which gives the idea of immensity.

Figure is the relation which the parts of the termination of a circumscribed space have within themselves. He then proceeds to refute the Cartesian doctrine, that body and extension are the same; and maintains that while body is full, space is empty, and that all bodies may easily pass into it; and while the latter is not physically divisible, that is, has not moveable parts, the parts of the former are moveable, and itself is physically divisible. What however space is actually, is left undetermined. He asserts the existence of a vacuum beyond the utmost bounds of body, and this is proved by the power of annihilation and the possibility of motion. The idea of succession arises from the perception of a continued series of sensations, and by observing the distance between two parts of the series we gain the idea of duration, which, when determined by a certain measure, suggests that of time; and as we arrive at the idea of immensity by the perception that we can enlarge any given extension without limit, so the unchecked repetition of succession originates that of eternity. That of power is formed partly by a perception that outward objects are produced and destroyed by others, partly by that of the action of objects on the senses, but chiefly from that of the mind's internal operations. The latter suggests the idea of active power, the former of passive. Now the will is the power of producing the presence or absence of a particular idea, or to produce motion or rest, and liberty is the power to think or not, to act or not to act, according as appears good to the mind. The will is determined by the understanding, which itself is influenced by a feeling of the unfitness of a present state, which is called desire.

As to the origin of the idea of substance:—we often find certain ideas connected together; and in consequence of this invariable association, we conceive of them as a single idea, and as the qualities which originate these ideas have no separate subsistence in themselves, we are driven to suppose the existence of a 'somewhat' as a support of these qualities. To this somewhat we give the name of substance, and relatively to it all qualities are called accidents.

Of the ideas of relation, those of cause and effect are got from the observation that several particulars, both qualities and substances, begin to exist, and receive their existence from the due application and operation of some other being. In the same manner the ideas of identity and diversity are derived from experience. When we compare an object with itself at different times and places, and find it to be the same, we arrive at the idea of identity. Whatever has the same beginning in reference to time and place is the same, and a material aggregate which neither decreases nor lessens is the same; but in organical and living creatures identity is determined not merely by the duration of the material mass, but by that of the organical structure and the continuance of consciousness. Lastly, moral good and evil are relations. Good and evil are nothing but that which occasions pleasure and pain; and moral good and evil are the conformity of human actions to some law whereby physical good or evil is produced by the will and power of the law-maker. Law is of three kinds: divine law, which measures sin and duty; civil, which determines crime and innocence; and philosophical, or the law of opinion or reputation, which measures virtue and vice.

Having thus examined the origin and composition of ideas, Locke proceeds to determine their general characters. He divides them accordingly into clear and obscure, distinct and confused, into real and fantastical, adequate and inadequate, and lastly, into true and false. In treating of this last distinction, he observes that all ideas are in themselves true; and they are not capable of being false until some judgment is passed upon them, or, in other words, until something is asserted or denied of them. But there is also that property in ideas, that one suggests another, and this is the so-called association of ideas. There are associations of ideas which are natural and necessary, as well as arbitrary, false and unnatural combinations. The danger of the last is vividly pointed out, which often arise from our having seen objects connected together by chance. Hence the association, which was originally purely accidental, is inevitably cemented in the imagination, which consequently biasses the judgment. Hence too a number of errors, not only of opinion but of sentiment, giving rise to unnatural sympathies and antipathies which not unfrequently closely verge upon madness. This gives occasion to a variety of judicious observations on the right conduct of education, the means of guarding against the formation of such unnatural combinations of ideas, and the method of correcting them when once formed, and of restoring the regular and due associations which have their ground in the very nature of the human mind and its ideas. What however are the leading laws of association Locke has not attempted to determine.

Before passing from this deduction of ideas to the examination of the nature and extent of the knowledge which is acquired by means of them, Locke devotes the third book of his Essay to the investigation of language and signs, which it is not important for our purpose to state.

Locke then proceeds to determine the nature, validity, and limits of the human understanding. All knowledge, strictly defined, is the perception of the agreement or disagreement of ideas, and is consequently limited to them. It extends therefore only so far as we are able to perceive the validity of the combinations and relations of our ideas, that is, so far as we are enabled to discover them by intuition, demonstration, and sensation. Intuition, which Locke calls an immediate perception of relation, does not apply to all ideas; many must be proved by means of some intermediate ideas. This is the province of demonstration, every step of which however is an act of intuition. Demonstration again does not apply to the proof of all ideas, since in the case of many no middle ideas can be found by means of which the comparison may be made. Sensation is still more limited, being confined to what is actually passing in each sense. Generally, all knowledge directs itself to identity or diversity, co-existence, relation, and the real existence of things. Identity and diversity are perceived by intuition, and we cannot have an idea without perceiving at the same time that it is different from all others. With regard to *co-existence* our knowledge is unlimited; for our ideas of substances are mere collections or aggregates of certain single ideas in one subject; and from the nature of these single ideas, it is impossible to see how far they are or not combinable with others. Hence we cannot determine what qualities any object may possess in addition to those already known to us. As to the actual existence of things, we have no intuitive knowledge thereof, except in the case of our existence; that of God is demonstrative, but of all other objects we only sensuously know that they exist, that is, we perceive mediately by sensation their existence or presence.

Locke next passes to an examination of propositions, axioms, and definitions. The utility of axioms is denied on the ground that they are not the only self-evident propositions, and because equal if not greater certainty is contained in all particular identical propositions and limited cases. Moreover they do not serve to facilitate knowledge, for all particular propositions will find a more ready assent; as, for instance, the proposition, twice two are four, will be more easily admitted than that the whole is equal to its parts. Moreover axioms are not useful for the proof of all lower propositions involved in them; they cannot consequently form the basis of any science; for example, no science has ever been raised on the basis of the principle of contradiction. They do not even contribute to the enlargement of knowledge, the false as well as the true may be proved by them, and consequently they serve at best but for endless dispute. Among these barren and unprofitable propositions, Locke reckons not merely those that are identical, but analytical also, or those in which a property contained in a complex idea is predicated of it: *e.g.* Every man is an animal. By such judgments or propositions we learn in fact nothing, and our knowledge is not increased in the least degree. Knowledge can only be extended by such judgments as predicate of a subject some quality or property which is not already involved in the idea of it. Synthetical propositions therefore are alone of value. In the next place he examines *certain* metaphysical problems, and concludes of most of them that they do not admit of any precise solution, while others might easily be set at rest if man would only come to the investigation of them free from all prejudices. Some very valuable remarks are added upon the sources of error, and on enthusiasm and faith, the due limits of which are pointed out, and the important truth repeatedly insisted upon, that reason is the ultimate test of revelation. The work concludes with a division of the object-matter of science or knowledge, which he makes to be threefold. 1. Natural philosophy, or physics, which is the knowledge of things both corporeal and spiritual. The end of this is speculative truth. 2. Ethics, or practice, which is the skill of rightly applying our powers and actions for the attainment of things good and useful, the end of it being not bare speculation, but right, and a conduct suitable to it. 3. The doctrine of signs (σημειωτική), the business of which is to consider the nature of the signs which the mind makes use of for the understanding of things or the conveying of its ideas to others. This is the most general as well as most natural division of the objects of the understanding. For man can employ his thoughts about nothing but either the contemplation of things for the discovery of truth; or about the things in his own power, which are his own actions for the attainment of his ends; or the signs which the mind makes use of in both, and the right ordering of them for its information.

Such is the celebrated Essay which has formed the basis of more than one school of modern philosophy, whose very opposite views may indeed find some support in the occasional variations and self-contradictions of its author. For it must be admitted that it is deficient in that scientific rigour and unity of view which preclude all inconsistency of detail. Nevertheless, rightly to appreciate Locke's philosophical merits, all contradictory passages must be neglected, or interpreted by the general spirit of his system. Attaching our attention then to the common mould and whole bearing of the Essay, we must conclude that the authority of Locke is unduly claimed by the followers of Condillac and the ideologists of France, whose object it was to approximate as closely as possible the rational thought and sensuous perception, and to explain the former as simply a result of the latter. For although Locke took in hand the defence of the sensuous element of knowledge, and, in opposition to Descartes and the idealists, endeavoured to show that in the attainment of science we set out from the sensible as the earlier and the better known, still he was far from denying that the rational thought, which is the perfection of human cognition, is really and truly distinct from the motions of the mind or soul occasioned by sensation. Setting out with the assumption of the permanence of ideas in the mind, Locke proceeds to illustrate the development of the particular into the general; and having then shown their difference from the unreal creations of the fancy, proceeds to determine their degree of verity. This description of the advance from the simple idea to universals and to knowledge, evidently implies an independent and spontaneous activity of the mind, which assents to the sensuous impressions, and confirms them by its conviction. Locke therefore is far from looking upon human science and knowledge as the simple results of the impressions produced by external objects on the senses. Nevertheless there is another aspect of his theory which in some degree justifies the use which has been made of his name, and under which he appears to be proceeding in the direction of thought, of which the ideologists have attained to the height. Knowledge as well as sensation is looked upon as the joint result of the reciprocal action of outward objects and the mental faculties, wherein as much depends on the qualities of the external as on those of the internal. While he admits that assent is entirely subjective, he nevertheless grants that outward objects constrain it; and as a consequence of such a view, he teaches that notwithstanding the idea produced in the mind by an outward object be a passive affection of the mind, it nevertheless reveals to the mind its efficient cause; and that in this manifestation of outward objects by the senses there is invariably attached, as by a necessary consequence, the judgment that those *objects* exist really. It is therefore clear that, according to Locke, we receive from the senses not merely the object-matter of knowledge, but that likewise the forms under which we conceive of objects are furnished to the mind from the same source.

The works of Locke have been collected and frequently published in 3 vols. fol., and a Life of him was written in 1772; but the most complete and best edition is that in 10 vols. 8vo., London, 1801 and 1812. A Life of Locke was published in 1829, by the late Lord King, a lineal descendant of his sister.

LOCKED JAW. [Tetanus.]

LOCKEREN, a town of East Flanders, in 51° 8′ N. lat. and 3° 58′ E. long., distant 6 miles north-west from Dendermond, and 10 miles east-north-east from Ghent, on the high road from that city to Antwerp. On the 1st of January, 1831, the population of the town amounted to 16,069 souls, and the number of houses to 2378. Several of the streets are regular and well built; the market-place is large, and surrounded by excellent houses. There is a large and commodious hospital, built in 1829, with funds chiefly contributed by three private citizens, one of whom gave the ground upon which it stands. Besides the parish church there are three chapels, a handsome town-hall, an orphan asylum, a prison, and seven communial and nine private schools.

Lockeren is a place of considerable trade, and contains many and various manufactories. Among the fabrics which are produced are cotton, linen, and woollen cloths, cotton hosiery and yarn, lace, sail-cloth, hats, and cordage; there are also many breweries, dye-houses, tanneries, and salt-refineries. A market is held every Wednesday, at which considerable quantities of farming produce are sold.

LOCRIS was employed to designate the country of three distinct Grecian tribes, the Locri Epicnemidii, the Locri Opuntii, and the Locri Ozolæ.

The Locri Epicnemidii and Locri Opuntii, who appear to have been more antient than the Locri Ozolæ, since the latter are not mentioned by Homer, inhabited the eastern coast of Phocis, and were separated from the latter country by a mountain range which stretches from Mount Œta to the borders of Bœotia. The northern part of this range, which is much higher than the southern, was called Cnemis, whence the Epi-cnemidii Locri derived their name. The Opuntii Locri derived their name from Opus, their chief town, on the borders of Bœotia.

The Locri Ozolæ were bounded on the west by Ætolia, on the north by Doris, on the east by Phocis, and on the south by the Corinthian Gulf. According to Strabo (ix., p. 427) they were a colony from the Eastern Locri. The origin of their name is uncertain; none of the etymologies given by Pausanias (x. 38) and Strabo (ix. 427) appear to be satisfactory. The inhabitants of the Western Locris are said by Thucydides (i. 5) to have been a wild and barbarous people even in the time of the Peloponnesian war; and in their manners and customs they appear to have resembled their neighbours the Ætolians. The principal towns of western Locris were Amphissa and Naupactus. Amphissa (Salona), an inland town at the head of the Crissæan Gulf, was destroyed by order of the Amphictyons, B.C. 338, for cultivating the sacred ground of Crissa. It was afterwards rebuilt, and in the war with the Romans, B.C. 190, it is mentioned by Livy (xxxvii. 5) as a place of considerable importance. Amphissa is said by Æschines (*Ctes.*, c., 39) to have been 60 stadia from Delphi, and by Pausanias (x., 38, sec. 20) 120 stadia. The real distance, according to Sir W. Gell, is seven miles. Naupactus (Nepakto, or Lepanto), on the sea-coast on the borders of Ætolia, was for a long time in the possession of the Athenians, who established there, in B.C. 455, at the close of the third Messenian war, those Messenians who quitted Ithome. On the termination of the Peloponnesian war it fell into the power of Sparta, and in later times was subject to the Ætolians.

The Leleges appear to have been the earliest population of Eastern Locris (Strabo, vii. 321); but the country was also inhabited in very early times by some tribes of the Hellenic nation, probably by Æolians. The Opuntii pretended that they were the most antient Hellenic people in Greece; and that Cynus, their port, had been inhabited by Deucalion, when he first descended from Parnassus (Strabo, ix. 425).

The Locri Epizephyrii, or Western Locri, who inhabited the south-eastern extremity of Italy, were a colony, according to Ephorus, of the Locri Opuntii, but according to Strabo of the Locri Ozolæ. It would appear from a statement in Pausanias (iii. 3, sec. 1) that the Spartans took a part in the foundation of this colony. An account of the political constitution of the Locri Epizephyrii is given in Müller's *Dorians* (ii., p. 243, English transl.). The time of the foundation of this colony is uncertain; according to some accounts it was founded B.C. 710, and according to others B.C. 683. The Locri Epizephyrii are said to have been the first Greek people who had a written code of laws (Strabo, vi., 397), which was drawn up by Zaleucus about B.C. 664.

Coin of Locris.
British Museum. Actual size. Silver.

LOCUS. This word, or the Greek τόπος, signifying simply *place*, was used by the first geometers to denote a line or surface over which a point may travel, so as always to be in a position which satisfies some given condition. Thus, suppose it required to find the position of a point at which a given line subtends a right angle: the answer is, that the number of such points is infinite; for that any point whatsoever upon the surface of a sphere which has the given line for its diameter is such a point as was required to be found. This would be expressed as follows:—the *locus* of the point at which a given line subtends a right angle, is the sphere described on the given line as a diameter. If however the point were required to be in a given plane, its locus would no longer be the whole sphere, but only that circle which is the common section of the sphere and the given plane.

The following assertions are really nothing more than common propositions of geometry, stated in such a manner as to introduce the term locus. (1.) The locus of the vertex of an isosceles triangle described upon a given base is the straight line which bisects the base at right angles. (2.) The locus of the vertex of a triangle which has a given base and a given area is a pair of straight lines parallel to, but on different sides of, the base. (3.) The locus of the vertex of a triangle which has a given base and a given vertical angle, and which lies on a given side of the base, is an arc of a circle of which the given base is the chord; and so on.

The geometrical analysis of the Greeks depended much upon the investigation of loci, and the method of using them will sufficiently appear by one instance. Suppose, for example, it is required to describe a triangle of given area and given vertical angle upon a given base. Laying down the given base, it is easy to draw the parallel which is the containing line, or locus, of the vertices of all the triangles which have the given area; and also, upon the same side, the arc of the circle which is the locus of the vertices of all the triangles having the given vertical angle. If then the parallel and the arc of the circle intersect, the point or points of intersection are obviously the vertices of triangles which satisfy all the required conditions; if they do not intersect, the problem is impossible. When the locus of all the points satisfying a given condition cannot be ascertained by elementary geometry, and when this locus is therefore taken for granted, we have the species of solution which was called *mechanical*. An instance of this will appear in the article Trisection of the Angle.

It is to be understood that no curve whatever is called the locus of a point, unless any point whatsoever of the curve may be taken as the point in question. Thus, if each of six points should satisfy certain conditions, all lying upon a given circle, and if no other point of the circle should satisfy those conditions, that circle would not be called the locus of the points.

LOCUST. The terms Locust and Grasshopper are applied to various insects of the order Orthoptera, and belonging to a section of that order to which Latreille applies the name *Saltatoria*, on account of the power of leaping which the species possess. The insects belonging to this section are remarkable for the great size of the thighs of the posterior pair of legs, which are generally very long, and adapted for leaping. The males of some of the species make a shrill sound by the friction of the elytræ. The part on which the sound is created is situated on the inner side and near the base of each elytra, is often transparent, and has been compared to a piece of talc. In other species the sound is produced by the friction of the thighs against the elytra.

The section *Saltatoria* contains three families, to which the names *Achetidæ*, *Gryllidæ*, and *Locustidæ* are applied by Dr. Leach. The family *Achetidæ* is thus defined:—Elytra horizontal; wings longitudinally folded, often produced beyond the elytra; tarsi three-jointed. This family contains the genera Gryllotalpa of *Ray, Leach*, and others, of which the mole-cricket (*G. vulgaris*) of this country affords an example, and *Acheta* of Fabricius, which is the Gryllus proper of the 'Règne Animal.' The common cricket in our houses (*Acheta domestica*) belongs to this genus. The genera *Tridactylus* and *Myrmecophila* are also included in the present family. In the family *Gryllidæ* the wings are disposed in an oblique manner when folded, the tarsi are four-jointed, the antennæ are long and setaceous, and the oviduct is exserted in the female, of a long and compressed form, and recurved.

The insects of this family form the genus *Locusta* of the 'Règne Animal.' The *Acrida viridissima* is the largest among the British species of the present group. This insect is not uncommon in some parts of England, and is about two inches in length and of a bright green colour.

The family *Locustidæ* is distinguished by the following characters:—Wings when folded meeting at an angle; tarsi three-jointed; antennæ filiform or ensiform; oviduct not exserted. The Locustidæ of Dr. Leach are comprised in the genus *Acridium* by Latreille. Unfortunately there is much confusion as regards the names of some of the genera and subgenera contained in this as well as the other families above noticed. Names originally applied to large groups are restricted to smaller sections, and as entomologists differ in opinion as to which particular division shall retain the original name, the same names are used to designate different groups; hence the references made in Latreille's portion of the 'Règne Animal.'

The principal genera contained in the family *Locustidæ* are:—

Locusta (Leach), in which the hinder legs are about equal to the whole body in length, and the antennæ filiform or terminated in a club. Upwards of twenty species of this genus are enumerated by Mr. Stephens in his 'Catalogue of British Insects,' and it is to this group that the *Gryllus migratorius* of Linnæus belongs, a large species, which has occasionally been found in Britain, and which in some parts of Europe sometimes multiplies to such a degree as to devastate large districts. Africa at all times appears to have been peculiarly subject to the ravages of these insects: of their extraordinary devastations in this portion of the globe we have records from the earliest authors, and the works of the most recent travellers confirm them. Mr. Barrow, in his 'Travels,' states, 'that in the southern parts of Africa an area of nearly two thousand square miles might be said literally to be covered with them. When driven into the sea by a north-west wind, they formed upon the shore for fifty miles a bank three or four feet high, and when the wind was south-east the stench was so powerful as to be smelt at the distance of 150 miles.' In Messrs. Kirby and Spence's 'Introduction to Entomology' numerous accounts of a similar nature will be found. In some parts of Africa they are cooked and eaten by the natives. The natives of Senegal are said to dry them, and having reduced them to powder, use them as flour.

Genus *Gomphocerus* (Leach). Hinder legs exceeding the body in length; antennæ capitate, having a spoon-shaped club in both sexes; anterior tibiæ simple. This genus contains numerous species, six or seven of which are found in England. They are usually of small size, and, together with the smaller species of the preceding genus, are commonly called grasshoppers.

Genus *Acrydium* (Leach). The species of this genus may be distinguished by the large size of the scutellum, which is produced posteriorly and covers the wings. They are found on hot sandy banks.

The genus *Pneumora* (Thunb.) has been established for the reception of certain African Locustidæ, which have a membranous pellet between the terminal hooks of the tarsi, the antennæ filiform, the posterior legs shorter than the body, and the abdomen vesicular—at least in one of the sexes.

The genus *Proscopia* of Klug contains numerous apterous species peculiar to South America, in which the body is long and cylindrical, the head destitute of ocelli and prolonged anteriorly, the antennæ short and filiform, the posterior legs long, and approximated to the intermediate pair, which are remote from the anterior pair.

LOCUST TREE is the Robinia Pseudacacia of botanists, a North American forest-tree. [ROBINIA.] The same name has also been given to the Ceratonia Siliqua, or Carob or Algaroba tree, which inhabits the Levant, and bears large pods, filled with nutritious pulp.

LOCUSTA (Crustaceology). [PALINURUS.]

LODDON. [BERKSHIRE.]

LODÈVE, a town in France, capital of an arrondissement, in the department of Hérault, on the road from Paris to Narbonne, Perpignan, and Barcelona. This town is noticed by Pliny, who calls the townsmen Lutevani. In the later Roman documents the name appears to have been corrupted to Lotева, whence the name Lodève. It was included in the Roman province of Narbonensis Prima. In the middle ages it was the seat of a viscounty; but in the crusade against the Albigenses the bishops of Lodève became lords of the town, and remained so till the French revolution. The bishopric (now suppressed) was established in the 5th century: the bishop was a suffragan of the archbishop of Narbonne. The town stands in a pleasant valley amid the lower slopes of the Cévennes, on the left bank of the Lergue, a small feeder of the Hérault. It is surrounded by ancient walls; the streets are narrow, and the houses ill built. The population in 1831 was 9974 for the town, or 9919 for the whole commune; in 1836 it had increased to 11,208 for the commune. The chief manufacture is that of coarse woollen cloths; hats, leather, earthenware, and soap are made; olive oil is pressed, and brandy distilled. Quarries of grey and white gypsum are worked in the neighbourhood. There are several judicial or fiscal government offices, an Agricultural Society, and a high school. Cardinal Fleury was born here.

The arrondissement of Lodève has an area of 474 square miles, and is subdivided into 72 communes; the population was 54,911 in 1831; in 1836 it was 57,759.

LODI, PROVINCIA DI LODI E CREMA, one of the provinces of the Lombardo-Venetian kingdom, is bounded on the north by the provinces of Milan and Bergamo, on the west by that of Pavia, on the south by the Po, which divides it from the duchy of Parma and Piacenza, and on the east by Cremona and Brescia. The province is part of the great plain of the Po, and is watered by the Adda, Serio, Lambro, and other affluents of that river. This province was divided into two small ones until the end of the last century, which were separated by the Adda, namely, Crema to the east of that river, which belonged to the republic of Venice, and Lodi west of the Adda, which was part of the duchy of Milan.

The actual province of Lodi and Crema is thirty miles in length from east to west, from the river Oglio near Orzinovi to the river Lambro near Melegnano; and above twenty-seven miles from north to south, from the southern boundaries of the province of Bergamo to the bank of the Po opposite Piacenza. It is divided into eight districts, namely, 1, Lodi, with 22 communes, 1935 houses, and 25,670 inhabitants; 2, Zelobuonpersico, 29 communes, 1920 houses, and 12,325 inhabitants; 3, Sant' Angelo, 17 communes, 1532 houses, and 15,037 inhabitants; 4, Borghetto, 19 communes, 1842 houses, and 19,425 inhabitants; 5, Casal Pusterlengo, 21 communes, 2259 houses, and 26,263 inhabitants; 6, Codogno, 24 communes, 4534 houses, and 39,952 inhabitants; 7, Pandino, 15 communes, 1976 houses, and 10,474 inhabitants; 8, Crema, 50 communes, 5498 houses, and 45,858 inhabitants. The soil is partly sown with corn and pulse, and partly planted with the vine and mulberry-trees; but the best part consists of artificial meadows, irrigated by canals, which feed numerous cows, from the milk of which the rich cheese is made, known in Lombardy by the name of Lodigiano, but which, by an old misnomer, is called in Southern Italy and the rest of Europe by the name of Parmesan. The annual produce is stated at 14,817 cwts. of flax, 1,028,957 cwts. of hay, 6402 cwts. of cheese, 2167 cwts. of butter, 4384 cwts. of silk cocoons, besides corn and wine. The number of cattle is stated at 36,046 heads of large cattle, 10,970 horses, 1135 asses and mules, 1338 sheep, and 15,525 pigs. (*Carta Topografica della Provincia di Lodi e Crema*, published by G. B. Orcesi of Lodi, with *Statistical Tables*, 1833.)

LODI, the capital of the province, situated on the high road from Milan to Southern Italy, is a well-built town on the right bank of the Adda, in a rich country: itis a bishop's see, and a place of considerable trade, and has 15,890 inhabitants, with manufactories of pottery and delft-ware, and silks. Crema, on the right bank of the river Serio, is smaller than Lodi, has 8670 inhabitants, manufactures of linens, and a fine stud for the improvement of the breed of horses in Lombardy. Lodi has a royal lyceum and a gymnasium, besides a clerical seminary, and a house for female education, founded by Mrs. Cosway, the widow of the English artist of that name. There is also a house of industry for paupers, an orphan asylum, two hospitals, and a Monte di Pietà. The sums spent annually by these establishments for the relief of the poor amount to 259,000 Italian livres, or about 10,400*l.* sterling. The savings' bank of Lodi, which was opened in 1823, had, at the close of 1837, a deposit of 300,000 Italian livres, about 12,000*l.* sterling. In every commune there is a school of elementary instruction, as in the rest of Lombardy.

LOFODEN ISLANDS. [TRONDHEIM.]

LOG and LOGLINE. This is the apparatus by which the velocity of a ship's motion through the water is measured. If at any moment a piece of wood, or other light substance, be thrown out of a ship while sailing, as soon as it touches the water it ceases to partake of the ship's motion; the ship goes on, and leaves it behind. If then after a certain interval, say of half a minute, the distance of the vessel from the floating body be accurately measured, the rate of the ship's motion through the water will be ascertained; we do not say the actual rate of the ship's going, but only that of its motion through the water, because in many cases currents exist, and the wood itself is carried along; consequently the true rate cannot thus be known.

This is the principle of the log: in practice the log is a flat piece of wood, sometimes shaped like a fish, but more generally of the figure of a quadrant, loaded with lead at one of its edges to make it float upright; to this is attached a line about 150 fathoms long, divided into equal lengths by little pieces of knotted twine rove into it. These divisions begin about twenty or thirty yards from the log, where a piece of red rag is usually fastened, in order to show the place readily. All the line between the log and the rag is called the stray line, and is of course omitted from the account. When the log is thrown into the sea, which is done from the lee quarter of the vessel, the log-line, by the help of a reel on which it is wound, is immediately veered out, at least as fast as the ship sails; as soon as the red rag leaves the reel, a half-minute glass is turned, and when the sand is all run down, the reel is stopped. Then by measuring the quantity of line run out, the distance sailed by the vessel in half a minute is known, and by calculation its rate of going per hour. There are various ways of dividing the line, the most usual of which is to place the knots at distances of fifty feet from each other; now as 120 times half a minute make an hour, and 120 times fifty feet make almost a geographical mile, so many knots will run from the reel in one experiment as the vessel sails miles in the hour; from this comes the expression of a vessel's sailing so many knots an hour—meaning miles. Fifty-one feet would be more accurately 120th part of a mile than fifty feet; but it is found practically that the ship's way is always a little more than that given by the log, arising from the circumstance that the line is unavoidably pulled in some degree, and the log is consequently not a fixed point; it is moreover safer to have a ship behind the reckoning than before it, which induces many commanders to shorten the distances between the knots to forty-eight and even forty-five feet. Whatever distance be taken, it is found convenient to subdivide it into ten parts for decimals of a mile. Careful commanders remeasure the log-line frequently, to ascertain if it varies from its original length. In case of an alteration they apply a correction to the rate found by a common process in the rule of three—as the length which the commander reckons upon is to the real interval, so is the apparent rate to the true rate. A similar correction is required if the half-minute glass is found to be wrong.

In the best regulated vessels the log is hove every hour; and in calculating the ship's going it is supposed that the rate has not varied between the intervals of heaving; but if the wind has sensibly varied, or more or less sail has been set during the time, then an allowance is made according to the discretion of the person who keeps the account.

About twelve years ago a very curious log was invented by Mr. Hookey, which though ingenious was too complex to come into general use; its object was to afford as great a resistance as possible to the pull of the line, and at the same time to be easily drawn back to the ship when its work was done. This log is shaped like a fish, and the line is in its mouth.

A more practically useful suggestion of Mr. Hookey was to soak the line in a mixture of three parts linseed oil and one part fish oil, which prevented its shrinking; a matter of no small importance when it is considered that a new line without preparation will lose 50 or 60 feet of its length by contraction when wetted.

All histories of mechanical invention will be found to contain suggestions for improving the mode of taking a ship's reckoning, some of which are worth a trial; but, so far as we are aware, the old log is invariably adhered to.

LOG-BOARD and LOG-BOOK. These contain the account of the ship's progress as deduced from observations of the log. The log-board is either a large piece of plank, blackened, ruled, and prepared for writing on with chalk, or else a slate with divisions scratched upon its surface. As soon as the seaman has hove the log, and the rate of motion is ascertained, the number of knots, with the odd tenths, are written on the board, each in its proper ruled column; also the course of the vessel, the direction of the wind, and any remarks made at the moment. This is repeated every time the log is hove, and once in twenty-four hours the whole is copied into a blank book called the log-book, which is ruled for the purpose in the same way as the log-board, and in which also all the transactions relative to navigation are inserted, such as bearings and distance of lands, rocks, and shoals, the direction and velocity of currents, and the state of the weather. It is also usual to set down every day the whole course and distance run, calculated from the results of all the several trials made by the log, with the distance and bearing of some port to which the ship is approaching. The account thus obtained is technically termed dead reckoning, and is never quite correct, being subject to all the errors caused by changing the direction and velocity in the intervals of observing, by the sort of guess usually made at the course and rapidity of currents, and at the amount of the falling off of the vessel from its apparent course, technically called lee-way. The dead reckoning is however necessarily used until an opportunity is afforded of taking observations for latitude and longitude, or until some place whose position is known comes in sight; the true place of the ship is then substituted in the log-book for that obtained by dead reckoning, and from that place subsequent reckonings are made until another observation.

Log-books are commonly sold in seaports, properly ruled for recording the events of a voyage. Although, strictly speaking, the log-book is confined to these objects, it is usual to include under the same appellation the whole of the ship's journal, or diary of occurrences.

LOGARITHMS. The etymology of this word is λόγων ἀριθμός, *the number of the ratios;* and the reason for this appellation will appear in the course of this article. We assume that the reader has the common knowledge of logarithms, and of the method of using them.

We have abandoned the intention of giving a view of the rise and progress of logarithms, for the following reasons. The subject is now one of such wide extent, when its theory and practice are both included, that it would be like writing the history of a complete science to put together all that would be needed in an article professing to show the past and present state of logarithmic algebra, as well as of logarithmic computation. If we were to confine ourselves to the latter only, the view of the subject would be too confined. And since the elements of the subject now usually given are clothed in the most modern algebraical form, it would take considerable space to explain at length the processes of the early writers in terms intelligible to those who are not conversant with their writings. We shall therefore devote the first part this article to such explanations as will enable the student fresh from modern books of algebra, to read the various histories which exist with facility; and we shall then point out how to deduce the principal formulæ connected with logarithms.

The early history of logarithms will be found at length in the preface to Dr. Hutton's Tables; in the 'History of Logarithms' contained in the first volume of Dr. Hutton's

Tracts; in Delambre's 'Histoire de l'Astronomie Moderne,' vol. i., pp. 491-568. See also NAPIER, BRIGGS, GUNTER, KEPLER, MERCATOR, &c.

The idea of logarithms originally arose (in the mind of Napier) from the desire to make addition and subtraction supply the place of multiplication and division. A table, in which are registered 1, a, a^2, a^3, &c., supplies this desideratum to a certain extent; for since a^x multiplied by a^y gives a^{x+y}, we find the product of the two first by adding their exponents, and looking in the table for the $(x+y)$th power. Thus for the set 1, 2, 4, 8, 16, &c., a table of logarithms is easily constructed, a specimen of which is as follows:—

Num.	log.	Num.	log.	Num.	log.
1	0	32	5	1024	10
2	1	64	6	2048	11
4	2	128	7	4096	12
8	3	256	8	8192	13
16	4	512	9	16384	14

Thus, to multiply 64 and 128, that is, to find the product of the sixth and seventh powers of 2, we must take the (6+7)th or 13th power, which, from the table, is 8192.

Such a table would be useless for general purposes, since it omits more numbers than it contains. But if we take a very little greater than unity, the powers will increase but slowly, and every whole number within given limits may be made either a power of a, or very near to a power of a. Suppose for instance that we wish for a table of logarithms which shall contain among its numbers either every whole number under a million or a fraction within h of every number under a million. Extract the square root of one million, the square root of that square root, and so on, until, say the rth root of one million has been extracted, and let this rth root be $1+t$. It is obvious that this extraction may be carried on until t is small as we please. Consequently $(1+t)^r$ is a million, and every lower power of $1+t$ is less than a million, so that (m standing for a million) no two consecutive powers differ by so much as the difference of m and $m\,(1+t)$, or by so much as mt. If then we proceed with the extraction until mt is less than h, we shall have t of the degree of smallness required: that is, since every whole number less than m lies between two powers of $1+t$, having exponents less than r, *à fortiori* every such whole number must be within h of some power of $1+t$.

This is in fact the first view which was taken of the method of constructing tables of logarithms; and it must be remembered that Napier was not in possession of the modern way of expressing the powers of quantities. On the methods of facilitating such enormous computations, and on the details which still remained for the first calculators after they had applied all the analysis which they had, we have not here to speak; but we shall now show how the table may be formed by mere labour, and how the word logarithm arises.

Let us suppose that our system is to be such that 0 being the logarithm of 1, a hundred thousand shall be the logarithm of 10. If the hundred-thousandth root of 10 be extracted and called $1+t$, it would be found that 2 is very nearly the 30103rd power of $(1+t)$, that 3 is very nearly the 47712th power of $1+t$, and so on. If then, beginning with 1, we increase it in the ratio of 1 to $1+t$, giving $1+t$; if we increase this in the ratio of 1 to $1+t$, giving $(1+t)^2$, and so on, it appears that we shall reach 2 (or very near to it, one way or other), when 30103 such ratios have been taken; or if we pass from 1 to 10 by 100,000 steps, increasing each time in the same ratio, we shall come nearest to 2 in 30103 steps, which is therefore the number of times the increase is made in a certain ratio, or the number of the ratios, the λογῶν ἄριθμος, or the logarithm of 2.

In such a table it must of course follow that the logarithm of a product is exactly or very nearly the sum of the logarithms of the factors, since for instance 2 being $(1+t)^{30103}$ and 3 being $(1+t)^{47712}$ very nearly, 6 must be very nearly $(1+t)^{77815}$. Nor is this property altered, if we divide or multiply all the logarithms by the same number. If then we divide every logarithm by 100000, the logarithm of 10 becomes 1, that of 2 becomes ·30103, and that of 3 becomes ·47712, as in the common tables.

The first step of importance which was made in the logarithmic analysis was the following. If t be very small, the lower powers of $1+t$, the square, cube, &c., are $1+2t$, $1+3t$, &c., very nearly; or if m and n be not so great but that mt and nt are still small, the mth and nth powers of $1+t$ are $1+mt$ and $1+nt$ very nearly. But the logarithms of these powers are m and n; that is, if k and l be small, the logarithms of $1+k$ and $1+l$ are very nearly in the proportion of k to l. If then we take two numbers, a and b, and extract a very high root (say the rth) of both, so that the results are very near to unity, say $1+k$ and $1+l$, we have (nearly)

$$\log.\sqrt[r]{a} \;:\; \log.\sqrt[r]{b} \;::\; k \;:\; l.$$

But the two first terms are in the same ratio as log a : log. b, since the multiplication of the former terms by r gives the latter. Consequently, when the logarithm of one number is known, that of any other can be found to any degree of nearness. We shall presently see this in a clearer form; it is sufficient here to show how the theorem was first obtained. If to the preceding methods we add that of INTERPOLATION, which Briggs used with success, we have before us the bases of the original computations of logarithms.

It was evident from the first that the connection between a logarithm and its number must be of the following kind: when the logarithm increases in arithmetical progression, the number must increase in geometrical progression; so that if a and $a+b$ be the logarithms of A and AB, then $a+2b$, $a+3b$, &c., must be the logarithms of AB^2, AB^3, &c. Several mathematicians had formed this conception; but the preliminary difficulty which stopped their progress was their being unable to present the series of natural numbers (or fractions of a high degree of nearness to them), in the shape of terms of a geometrical progression. The great merit of Napier is threefold: first, he distinctly saw that all numbers, within any given limit, may be either terms, or as near as we please to terms, of a geometrical progression; secondly, he had the courage to undertake the enormous labour which was requisite for the purpose; thirdly, he made an anticipation of the differential calculus in developing the primary consequences of the definition.

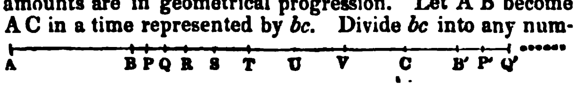
The predecessors of Napier probably did not well understand the notion of a quantity varying in geometrical ratio, while another varied simultaneously, but in an arithmetical ratio. The difficulty is that which a beginner finds in seizing the notion of compound interest carried to its extreme limit, so that every fraction of interest, however small, begins to make interest from the moment it becomes due. We have preferred to omit this consideration in the article INTEREST, where it would have been of no practical use, and to introduce it here, where it may aid in the explanation of the first principles of logarithms.

Let £1 become £$(1+r)$ in a year, and consequently, at the same rate of interest, it becomes £$(1+r)^n$ in n years. Suppose however that interest, instead of being payable yearly, is paid z times in a year, and that interest makes interest from the moment it is paid. Consequently, at the end of the first, second, &c. fractions of a year, the pound first put out becomes

$$1+\frac{r}{z},\quad \left(1+\frac{r}{z}\right)^2,\quad \left(1+\frac{r}{z}\right)^3\ \ldots$$

or $\left(1+\frac{r}{z}\right)^z$ at the end of one year, and $\left(1+\frac{r}{z}\right)^{nz}$ at the end of n years.

If we may make z as great as we please, that is, if we may make payments of interest follow one another as quickly as we please, we may make the increase of the pound approach as nearly as we please to a gradual increase, of which it must be the characteristic that in successive equal times the amounts are in geometrical progression. Let A B become A C in a time represented by bc. Divide bc into any number of equal parts, and in the successive equal times bp, pq, qr, &c., let a point move through B P, P Q, Q R, &c. In the article ACCELERATION is explained the manner in which a succession of impulses, sufficiently small in amount, and often repeated, may be made to give, as nearly as we please,

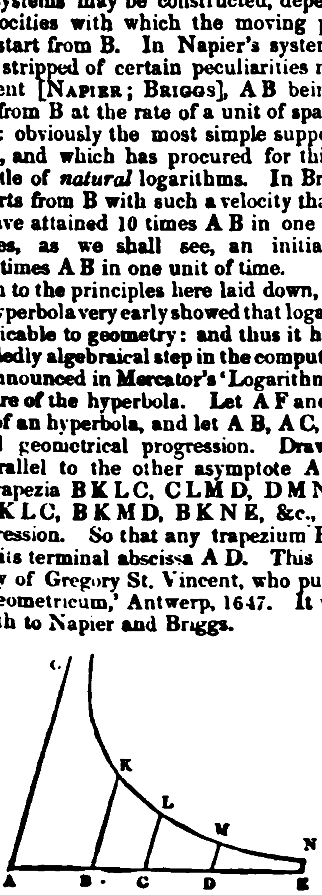


the results of a perfectly gradual motion. At B let a velocity be given sufficient to carry the point to P in the time bp; at P let an impulse be given which would cause P Q to be described in the time pq, and so on. And let A B, A P, A Q, &c. be a continued set of proportionals, namely, A B : A P : : A P : A Q : : A Q : A R, &c. Increase the number of subdivisions of bc without limit, and we approach as a limit to gradual motion of such a kind that the distances of the point from A, at the end of *any* successive equal times, shall be in continued proportion. To show this, suppose we compare the motion from B to C with any other part of the motion described in some subsequent time $b'c'$ (equal to bc), and which carries the moving point from B′ to C′. Divide the time $b'c'$ into as many equal parts, $b'p'$, $p'q'$, &c., as before, and let B′P′, P′Q′, &c. be the lengths described in the second set of subdivisions. Then by the law of the motion A B : A P : : A B′ : A P′, whence B P and B′P′ are in the ratio of A B to A B′; and similarly P Q and P′Q′ are in the ratio of A P to A P′, that is, of A B to A B′; and so on. Consequently, the sum of B P, P Q, &c., or B C is to the sum of B′P′, P′Q′, &c., or B′C′, in the same ratio of A B to A B′; whence also A C is to A C′ as A B to A B′, or A B : A C : : A B′ : A C′. That is, if in any one time the distance from A increases from X to Y, and in any other equal time from X′ to Y′, then X : Y : : X′ : Y′. From which it readily follows that the distances attained at the ends of successive equal times are in continued proportion.

More than this, the velocities of the moving point at B and B′ are as B P to B′ P′ (these being spaces described in equal times): and the ratio of these, however many may be the number of subdivisions, is always that of A B to A′ B′. Hence a gradual motion of the character described is one in which the velocity of the moving point increases in the same proportion as the distance from A.

In the preceding diagram, the time elapsed from B to C is the logarithm of A C, that of A B being 0. An infinite number of systems may be constructed, depending on the different velocities with which the moving point may be supposed to start from B. In Napier's system, at least in that system stripped of certain peculiarities not worth noting at present [Napier; Briggs], A B being a unit, the point starts from B at the rate of a unit of space (A B) in a unit of time: obviously the most simple supposition which can be made, and which has procured for this system the distinctive title of *natural* logarithms. In Briggs's system the point starts from B with such a velocity that (A B being 1) it shall have attained 10 times A B in one unit of time. This requires, as we shall see, an initial velocity of 2·302585 ... times A B in one unit of time.

In addition to the principles here laid down, a known property of the hyperbola very early showed that logarithms would become applicable to geometry: and thus it happened that the first decidedly algebraical step in the computation of logarithms was announced in Mercator's 'Logarithmotechnia,' as the quadrature of the hyperbola. Let A F and A G be the asymptotes of an hyperbola, and let A B, A C, A D, &c., be in continued geometrical progression. Draw B K, C L, D M, &c. parallel to the other asymptote A G, then the hyperbolic trapezia B K L C, C L M D, D M N E, &c., are equal, or B K L C, B K M D, B K N E, &c., are in arithmetical progression. So that any trapezium B K M D is a logarithm to its terminal abscissa A D. This property was the discovery of Gregory St. Vincent, who published it in his 'Opus Geometricum,' Antwerp, 1647. It was therefore unknown both to Napier and Briggs.



We shall now take the question of logarithms, availing ourselves of the power of modern algebra.

Definition.—By the logarithm of a number let any such function of that number be understood as has the following property. When x is to y as x' is to y', the logarithm of x exceeds or falls short of the logarithm of y by as much as the logarithm of x' exceeds or falls short of that of y'. Let ϕx be the function which a number is of its logarithm: so that $x = \phi\ (\log x)$. If then a and $a + b$ be logarithms of x and y, and if c be the logarithm of x', then as $x : y : : x' : y'$, $c + b$ must be the logarithm of y'. And x, y, x' and y' are severally $\phi\, a$, $\phi\,(a + b)$, $\phi\, c$ and $\phi\,(c + b)$. But $x y' = x'y$, or

$$\phi\, a \times \phi\,(c + b) = \phi\, c \times \phi\,(a + b).$$

Let $\phi\, a$ or x be the number which has 0 for its logarithm; then $a = 0$; and calling N the number in question, we have

$$\mathrm{N} \times \phi\,(c + b) = \phi\, c \times \phi\, b,$$

$$\text{or}\quad \frac{\phi\,(c + b)}{\mathrm{N}} = \frac{\phi c}{\mathrm{N}} \times \frac{\phi\, b}{\mathrm{N}}.$$

But by the theorem proved in the article Binomial Theorem (p. 413), this can only be true on the supposition that $\phi\, c \div \mathrm{N}$ is such a function of C as C^c, where C is independent of c. Consequently, the number whose logarithm is c must be $\mathrm{N\,C}^c$. This evidently satisfies the conditions, and the theorem quoted shows it to be the only function which satisfies the conditions.

It is most convenient to assume 1 as the number N, which has 0 for its logarithm. We have then the following equation, connecting a number with its logarithm,

$$\mathrm{C}^{\log x} = x:$$

so that every number has a logarithm for any value of C we may take, only it must be remembered that the same value of C must always be used. The logarithms of all numbers for a given value of C form a *system:* and C is called the *base* of that system.

Given a system of logarithms, we now inquire how to find the logarithms in any other system. Let A and B be the bases of the systems, and a and b the logarithms of any number x in the two bases. Then we have

$$\mathrm{A}^a = x,\quad \mathrm{B}^b = x,\quad \text{or } \mathrm{A}^a = \mathrm{B}^b;$$

$$\text{whence}\quad \mathrm{B} = \mathrm{A}^{\frac{a}{b}},\ \text{or } \log \mathrm{B}\ (\text{base A}) = \frac{a}{b},$$

$$b = \frac{a}{\log \mathrm{B}\ (\text{base A})},\ \text{or } \log x\ (\text{base B}) = \frac{\log x\ (\text{base A})}{\log \mathrm{B}\ (\text{base A})};$$

that is, to turn one system of logarithms into another with any new base, divide every logarithm in the system by the logarithm which there belongs to the new base.

We now proceed to the method of determining logarithms. In the article Limit it is shown, by means of the binomial theorem, that of the two series

$$1 + a + \frac{a^2}{2} + \frac{a^3}{2.3} + \frac{a^4}{2.3.4} + \ldots.;$$

$$1 + ax + \frac{a^2x^2}{2} + \frac{a^3x^3}{2.3} + \frac{a^4x^4}{2.3.4} + \ldots.;$$

the second is the xth power of the first. A remarkably simple case presents itself, which, in fact, leads to Napier's system of logarithms: it is when $a = 1$. In this case the first series becomes

$$1 + 1 + \frac{1}{2} + \frac{1}{2.3} + \frac{1}{2.3.4} + \ldots..,$$

which is very convergent, and is 2·7182818 very nearly. This remarkable series is generally denoted by ϵ (sometimes by e, Laplace always uses c for it), and we have

$$\epsilon^x = 1 + x + \frac{x^2}{2} + \frac{x^3}{2.3} + \ldots..$$

In Napier's system, then (we shall presently show that this is Napier's system), x is the logarithm of $1 + x + \frac{1}{2}x^2 + \ldots.$; or, the logarithm being given, the number can be immediately found.

Since the last equation is universally true, for x write $\log a \times x$, where $\log a$ means $\log a$ (base ϵ) The first side then becomes

$$\epsilon^{\log a \times x},\ \text{or } \left(\epsilon^{\log a}\right)^x,\ \text{or } a^x;$$

$$a^x = 1 + \log a\, x + \frac{(\log a)^2 . x^2}{2} + \ldots...;$$

$$\frac{a^x - 1}{x} = \log a + \frac{(\log a)^2 . x}{2} + \ldots\ldots;$$

if x be diminished without limit, we have then

$$\text{Limit of } \frac{a^x - 1}{x} = \log a \text{ (base } \epsilon);$$

or, for a given (and very small) value of x, the logarithms of different numbers (a) are very nearly in the proportion of the values of $a^x - 1$. This is the theorem to which we have before alluded.

Let $a = 1 + b$, then

$$(1+b)^x = 1 + xb + x\frac{x-1}{2}b^2 + x\frac{x-1}{2}\,\frac{x-2}{3}b^3 + \ldots$$

$$\frac{(1+b)^x - 1}{x} = b + \frac{x-1}{2}b^2 + \frac{x-1}{2}\,\frac{x-2}{3}b^3 + \ldots.:$$

if x diminish without limit, the limit of the first side has been shown to be $\log(1+b)$, the base being ϵ, which is always to be understood when the contrary is not expressed. The limit of the second side is easily found by making $x = 0$, and we thus have

$$\log(1+b) = b - \frac{b^2}{2} + \frac{b^3}{3} - \frac{b^4}{4} + \ldots.,$$

which however is only convergent when b is not greater than unity. Since this last is universally true, we find, by substituting $-b$ for b,

$$\log(1-b) = -b - \frac{b^2}{2} - \frac{b^3}{3} - \frac{b^4}{4} - \ldots.;$$

and subtracting the first from the second, remembering that

$$\log(1+b) - \log(1-b) = \log\frac{1+b}{1-b},$$

we find that

$$\log\frac{1+b}{1-b} = 2\left\{b + \frac{b^3}{3} + \frac{b^5}{5} + \ldots\ldots\right\}$$

Let $\frac{1+b}{1-b} = x$, or $b = \frac{x-1}{x+1}$;

$$\log x = 2\left\{\frac{x-1}{x+1} + \frac{1}{3}\left(\frac{x-1}{x+1}\right)^3 + \ldots.\right\},$$

which is always convergent, but converges very slowly when x is considerable. If however we make

$$x = \frac{z+1}{z}, \text{ or } \frac{x-1}{x+1} = \frac{1}{2z+1};$$

then, remembering that $\log\frac{z+1}{z} = \log(z+1) - \log z$, we have

$$\log(z+1) = \log z + 2\left\{\frac{1}{2z+1} + \frac{1}{3}\,\frac{1}{(2z+1)^3} + \ldots\right\},$$

which is very convergent when z is even so small as 1, and serves to find the logarithm of any number when that of the next lower number is given. The two following series, which may be easily proved from the preceding, will complete the list of those which are most useful in practice:

$$\log(z+a) = \log z + \frac{a}{z} - \frac{1}{2}\,\frac{a^2}{z^2} + \frac{1}{3}\,\frac{a^3}{z^3} - \ldots.$$

$$\log(z+a) = \log z + 2\left\{\frac{a}{2z+a} + \frac{1}{3}\left(\frac{a}{2z+a}\right)^3 + \ldots.\right\}.$$

It only remains to show the identity of this system with that of Napier. If t be the number of seconds elapsed from the beginning of a motion, and if a^t be the length described in that time, then the time is the logarithm of the length described. The *velocity* at the end of t seconds in the differential coefficient of a^t, or $a^t . \log a$, where the logarithm used is that of the preceding algebraical system: this velocity is therefore $\log a$ at starting, or when $t=0$. Now, in Napier's system this velocity is unity, or $a=\epsilon$: that is, the base of Napier's logarithms is the series called ϵ. But in the system where base is 10, $\log a$ is 2·3025851, which is the velocity at starting assumed by Briggs.

By the foregoing series a system of Naperian logarithms may be calculated with a very small fraction of the labour which they cost their inventor. This having been done for all whole numbers within the given limits, the logarithm of any fraction is readily found by subtracting the logarithm of the denominator from that of the numerator.

It must be admitted that Briggs, by his construction of the decimal system, divides with Napier the merit of inventing logarithms, considered as an instrument of calculation. In the Naperian system the table must either be carried to an enormous length, or whole numbers only must have logarithms, and every logarithm of a fraction will require two entries of the table and a subtraction. But in Briggs's system the logarithm of every decimal fraction can be found by one entry of the table, and one inspection of the fraction.

The peculiarity of this system (the base of which is 10) is as follows:—Every number or fraction is either a power of ten, positive or negative, or lies between two powers of ten. The powers of ten are ranged in the following table:—

……………		
$10^{-4} = {}$·0001	$10^0 = 1$	$10^1 = 10$
$10^{-3} = {}$·001		$10^2 = 100$
$10^{-2} = {}$·01		$10^3 = 1000$
$10^{-1} = {}$·1		$10^4 = 10000$
		……………

From which the following rules may easily be obtained: a number which has m figures before the decimal point lies between 10^{m-1} and 10^m, and its logarithm therefore lies between $m-1$ and m, or it is $m - 1 +$ a fraction less than unity. Also, if a fraction be less than unity, and if its first significant figure lie in the nth decimal place, this fraction lies between 10^{-n} and $10^{-(n-1)}$; so that its logarithm is $-n +$ a fraction less than unity. Now the convenience of Briggs's system lies in this, that the fraction less than unity, which is a part of every logarithm, does not depend on the position of the decimal point, but entirely upon the significant figures: the reason being, that an alteration of the position of the decimal point being a multiplication or division by some whole power of 10, alters the logarithm by the addition or subtraction of a whole number. This question is discussed in every treatise on the mode of using logarithms.

Let a be the base of a system of logarithms, and let $\log x$ signify simply the Naperian or natural logarithm of x; then by the theorem already proved

$$\log \text{ (base } a) = \frac{\log x}{\log a} = \frac{1}{\log a}\cdot\log x.$$

The factor $1 \div \log a$, which converts Naperian logarithms into those whose base is a, is called the *modulus* of the system whose base is a. In Briggs's system this modulus is ·4342945 nearly, and the logarithms of this system being called *common* or *tabular* logarithms, we have—

$$\text{common } \log x = {}\cdot 4342945 \times \text{Nap. } \log x$$

$$= \frac{43}{99} \times \text{Nap. } \log x, \text{ very nearly.}$$

$$\text{Nap. } \log x = 2\cdot 3025851 \times \text{com. } \log x,$$

$$= \left(\frac{100-1}{43} + \frac{1}{4000}\right) \times \text{com. } \log x.$$

In the article NEGATIVE AND IMPOSSIBLE QUANTITIES will be found a further extension of the theory of logarithms: in TABLES will be found a list of tables for different purposes. A treatise on computation by logarithms will be found in the 'Library of Useful Knowledge,' in 'Examples of Processes of Arithmetic and Algebra.'

LOGARITHMIC CURVE and LOGARITHMIC SPIRAL. The former has for its rectangular equation $y = a^x$, and its most remarkable property is that its subtangent is the same at every point of the curve. The latter has $r = ca^\theta$ for its polar equation, and its tangent always makes the same angle with its radius vector; whence it is called the equiangular spiral.

LOGIC. [ORGANON.]

LOGISTIC. [PROPORTIONAL.]

LOG'OS, λόγος, the Greek for *a word*, is used as a theological term.

1. *The Jewish doctrine of the Logos.*

The phrase *the Word* or *Memra of Jehovah* (מֵימְרָא דַיְיָ) occurs repeatedly in the Chaldee Targums, where it commonly stands in the place of יְהוָֹה (Jehovah) in the Hebrew original. There are however passages in which this phrase appears to denote a distinct personal existence; and many eminent critics, among whom are Bertholdt and Wegscheider, are decidedly of opinion that the Targumists intended it to apply to the Messiah; 'plainly showing it to have been their belief that the Shechinah, or Word, as some of them indeed expressly say, would employ the future Messiah, when he should be born, as the instrument of his gracious designs, and would be joined to him in a personal union.' (Bertholdt, *Christol. Jud.*)

Philo often speaks of the Logos, but his views on the subject are involved in much obscurity. He seems however to have had the idea of a two-fold Logos; the one denoting a conception in the divine mind according to which the world was created; the other a personal existence, the Son of God, partaking of the divine nature, though inferior to the supreme God, the Creator of the world (δημιουργος), presiding over the universe, the instructor and guide of man, the High Priest and Mediator between God and man. These two ideas of the Logos he often confounds together. The passages from Philo are collected in Dr. J. P. Smith's *Scripture Testimony to the Messiah*, book ii., cap. vii., sect. 4.

See also the descriptions of Wisdom and the Word of God in *Prov.* viii.; *Wisdom of Solomon*, x. 15-19; xi. 1-4; xviii. 15 (compare 1 *Cor.*, x. 4, 9, where the same actions are attributed to Christ); and in other parts of the *Wisdom of Solomon* and *Ecclesiasticus*.

These opinions are thought by some to represent the antient Jewish doctrine respecting the word of God, corrupted by a mixture of heathen philosophy; and by others to have been wholly borrowed either from the Platonic philosophy or from the Magian doctrine of divine emanations and Æons.

2. *The Christian doctrine of the Logos.*

The only examples of the theological use of this word in the New Testament are found in the writings of John (*Gospel*, c. i.; 1*st Epistle*, i. 1; *Rev.*, xix. 13). These passages are generally allowed to refer to Christ; but the sense in which Logos is to be taken, and the nature of the connection between this Logos and the person of Christ, are subjects of much dispute.

The Trinitarian expositors assert that these passages can mean nothing else than that the Logos is a distinct personal subsistence, which has existed from all eternity in a union of nature and of essence with God, which created the universe, and which was joined with a human nature to form the person of Christ.

The Arian doctrine represents the Logos as an emanation from the Deity, superior to all other created beings, and which supplied the place of a human soul in the person of Christ.

Most Unitarian divines consider it to be used either for God himself, or as an abstract term for the wisdom and intelligence of God which was fully imparted to Christ to fit him for his mission.

Those who attribute to the Logos a personal existence give different reasons for the origin of the name. Some explain it to mean the *speaker* or *teacher*, by metonymy, as Christ is called by John the Light, the Way, the Truth, the Life; others interpret it *the promised one;* and others consider that as speech (λόγος) is a *medium* of rational communication, so the name Logos is given to the *Mediator* between God and man, one who speaks to man in the name of God.

(The Lexicons of Schleusner, Wahl, and Bretschneider, *in loco;* Kuinoel, *Comment. in Lib. Hist. N. T.*, *Prolegomena in Johan.*, sect. 7; Lücke *on the Epistles of John*, in the *Biblical Cabinet*, p. 102; Dr. J. P. Smith's *Scripture Testimony to the Messiah;* Lardner's *Letter on the Logos*, *Works*, vol. x.)

LOGWOOD, a kind of timber imported from the West Indies for the purposes of the dyer, is the wood of a low tree called *Hæmatoxylon Campechianum*, found very commonly in many parts of the West Indies and adjoining continent, especially Honduras, on which account it has been called Campeachy-wood. It belongs to the natural order Leguminosæ, and to the section Cassieæ. The branches are usually crooked, spiny, and deformed; the leaves are small and pinnate; the flowers grow in long racemes, are yellow, sweet-scented, and have ten separate stamens, half of which are shorter than the others. The fruit is a thin flat two-seeded legume, not opening at the sutures, but bursting longitudinally by a division passing down though both valves.

The wood is hard enough to take a fine polish, and might be used by cabinet-makers; it is not however imported for that purpose. In Jamaica the tree is used for fences, in the same way as the whitethorn in England, and it is said to be admirably adapted for the purpose. Logwood is so heavy as to sink in water, and scarcely susceptible of undergoing decay.

Its colouring matter is dissolved both by water and alcohol, and it is principally derived from the presence of a peculiar body, to which Chevreul, who discovered it, gave the name of *hematin* or *hæmatoxyline:* this is sometimes so abundant as to exist in the wood in crystals of distinct form, of a fine red colour, and considerable size. Besides hematin, logwood contains resin, oil, acetic acid, and salts of potash, and lime combined with a vegetable acid, a little sulphate of lime, alumina, peroxide of iron, and manganese. [HEMATIN; HÆMATOXYLON.]

Logwood is employed by the calico-printer to give a black or brown colour, the cloth being always first impregnated with alum mordant, and thus black is obtained. Iron mordant and logwood also yield a black, but it is not so good as with the alum mordant. Cloth with the alum mordant, dyed in a mixture of logwood and madder, has a fine brown colour fixed upon it. Logwood is also employed in the preparation of some lakes.

Trade.—(*Bois de Campêche*, French; *Kampescholz*, German; *Campecheout*, Dutch; *Palo de Campeche*, Spanish.) The importations of this dye-wood into the United Kingdom during each of the last ten years, and the quantities re-exported and taken for use, have been as follows:—

	Imported. Tons.	Exported. Tons.	Consumption. Tons.
1828	14,045	6395	9,297
1829	13,893	6226	8,852
1830	16,781	5937	10,100
1831	14,852	6011	10,405
1832	18,773	4427	12,415
1833	26,079	7045	17,595
1834	21,054	4548	14,026
1835	16,744	3697	14,727
1836	12,880	4385	12,361
1837	14,699	3316	12,023

The importations of logwood are brought into Europe from the West Indies and Mexico. The British possessions of Jamaica and Honduras have upon the average furnished about one half of the above importations into this kingdom. The principal part of the exportations from England are made to Russia, Prussia, and the Netherlands. Logwood is an article of commerce the price of which fluctuates violently. Under ordinary circumstances of demand and supply its price is from 5*l.* 10*s.* to 7*l.* per ton. It has sometimes been sold as low as 4*l.*, and at others as high as 35*l.* per ton. At this time (January, 1839) a temporary short supply has raised the price to about 12*l.* per ton. The duty when imported from a British possession is 3*s.* per ton, and when from a foreign country 4*s.* 6*d.* per ton.

LOHEIA. [ARABIA.]

LOIR, a river in France belonging to the system of the Loire.

LOIR ET CHER, a department in France bounded on the north by that of Eure et Loir; on the north-east by that of Loiret; on the south-east by that of Cher; on the south by that of Indre; on the south-west by that of Indre et Loire; and on the north-west by that of Sarthe. Its form approximates to that of a parallelogram, having its longer sides facing the north-east and south-west. Its greatest length is from the neighbourhood of Montmirail (Sarthe) to that of Vierzon (Cher) 82 miles; its greatest breadth is from between Châteaudun (Eure et Loir) and Orléans (Loiret) to the neighbourhood of La Chartre (Sarthe) [illegible] miles. The area of the department is estimated at 2[illegible] square miles; with a population in 1831 of 235,750; in 1836 of 244,043; showing an increase in five years of 82[illegible], or about 3½ per cent.; and giving a little more than 1[illegible] inhabitants to a square mile. In respect of size the department is almost equal to the English county of Devon, but it has not half the population of that county. Blois, the capital, is 96 miles south-west of Paris in a direct line, or 105 miles by the road through Orléans. It is in 47° 35 N. lat., and 1° 20′ E. long. from Greenwich.

The department is almost entirely a flat, having in the south-east part a considerable number of *étangs*, or pools, and marshes. The supercretaceous strata which occupy the chalk-basin of Paris extend into the department from the north-east and occupy the banks of the Loire as far as the junction of the Beuvron. In all other parts the department is occupied by the chalk itself. The general inclination of the surface is toward the west and south-west.

The principal river is the Loire, which has a tolerably direct south-west course of 30 miles, or rather more, through the department, which it divides into two nearly equal portions; it is navigable throughout. The Cher, one of the principal tributaries of the Loire, enters this department on the south-east, near Menetou, and flows westward, in one part upon, but mostly within, the border of the department, past the towns of Menetou, Selles, St. Aignan, and Montrichard, into the department of Indre et Loire. The Cher is navigable for about 12 miles before leaving this department.

The Grande (or Great) Sauldre enters the department on the east side, and after being joined by the Petite (Lesser) Sauldre and the Rère, both of which also rise out of the department, and by the Croisne, joins the Cher just below Selles. The Fouzon, another feeder of the Cher, has a small part of its course within the department. The Beuvron and the Cosson enter the department from the east, and after receiving, each of them, a few small streams, fall into the Loire on the south-east bank, near one another, a few miles below Blois. The Cisse Landeron, a small stream, falls into the Loire opposite the Cosson. In the northern part of the department the Loir enters it near Cloyes, a town a little below Châteaudun, and flows in a sinuous channel to the south-west past Freteval, Vendôme, Les Roches, and Montoire. The Braye, a feeder of the Loir, flows partly on, partly within, the north-western border till its junction with the Loir. The Grenne and the Couëtron, feeders of the Braye, also water the north-west. None of these rivers are navigable in the department. The Canal du Berry, intended to shorten the navigation of the Loire, by avoiding the tedious bend between the junction of the Allier and that of the Indre, has about 46 or 47 miles of its course in this department.

The department is traversed by six 'Routes Royales,' or government roads, having an aggregate length of 169 miles, viz. 113 in repair, 23 out of repair, and 33 unfinished. The most important of these roads is that which runs from Paris through Châteaudun and Vendôme to Tours. The next in importance is that which runs from Paris by Orléans and along the north bank of the Loire to Blois. At Blois it divides; one branch continuing along the north bank of the Loire to Tours, where it joins the main road through Châteaudun, crosses the Loire, and runs to Angoulême and Bordeaux; the other branch crosses the Loire at Blois, and runs by Celles to Châteauroux, where it falls in with the road from Paris to Limoges, Cahors, and Toulouse. Another road runs from Blois to Vendôme and Le Mans. The main road from Paris by Orléans to Châteauroux and Limoges crosses the eastern side of the department. The 'Routes Départementales' are fourteen in number, and have an aggregate length of 223 miles, of which 119 are in repair, 29 out of repair, and 75 unfinished. The bye-roads and paths are in number two thousand two hundred and seventy-four, and have an aggregate length of 4190 miles.

The soil varies much; the northern part is in general more productive than the southern. About three-fifths of the whole are arable; and about one-seventh consists of land entirely unproductive, or of open waste land on which poor pasturage is obtained; about one-ninth of the soil is woodland. The quantity of meadow and good pasture land is small; but the vineyards are tolerably extensive. The quantity of grain raised is greater than the consumption of the department. The best wines are the white wines of [illegible] and [illegible] and the red wines of the banks of the Cher. Vegetables, fruit, and hemp are grown in considerable quantity; liquorice and beet-root, the latter for sugar, are cultivated on a large scale. Horses, horned cattle, and sheep are bred; the last in considerable numbers. There is a stud maintained at Blois for the improvement of the breed of horses; and prizes are given to the owners of the finest animals. Poultry, game, and fish are abundant. The mineral productions are limestone, gun-flints procured from the chalk strata, and potters' clay; some iron and lead mines are wrought.

The department is divided into three arrondissements, as follows:—

	Sq. Miles.	Pop. in 1836.	Communes.
Blois, central	921	118,561	138
Vendôme, north-west	659	77,760	110
Romorantin, south-east	[illegible]	47,722	48
	2424	244,043	296

The three arrondissements contain 24 cantons, or districts under a justice of the peace.

In the arrondissement of Blois are Blois, capital of the department, on the north bank of the Loire (population in 1831, 11,002 for the town, or 13,138 for the whole commune; in 1836, 13,628 for the whole commune) [BLOIS]; Vienne, a suburb of Blois, south of the Loire; Mer and Suevre, near or on the north bank, and St. Dié, opposite Suevre, on the south bank of the same river; Herbault, Oucques, Marchenoir, and Ouzouer le Marché, north of the Loire, but distant from it; Chambord on the Cosson; Bracieux and Cour-Cheverny on or near the Beuvron; Contres and Cormier on the Bièvre, a feeder of the Beuvron; and St. Aignan and Montrichard on the Cher; all south of the Loire. Mer (pop. 1717 for the town, 2233 for the whole commune) is in the centre of a vine district, and the townsmen carry on trade in wine and brandy. Suevre is a small place, with a population, in 1818, of about 1200. At St. Aignan (pop. 2259 town, 2772 whole commune) are some manufactures of woollen cloth. There are flint quarries near it. Chambord has a castle built by François I. from the designs of the architect Primaticcio; 1800 workmen were employed upon it for twelve years; but it was not quite finished until the reign of Louis XIV. It is a building imposing from its extent, but irregular in its construction. It is an assemblage of towers large and small, having its walls figured with small black round or lozenge-shaped stones. There is a remarkable double spiral staircase by which one person can ascend and another descend without their seeing each other. Chambord was till the time of Louis XIV. the frequent residence of the French kings. It was bestowed by Louis XV. on Maréchal Saxe, and by Bonaparte on Maréchal Berthier, prince of Wagram. At Menars on the north bank of the Loire, between Suevre and Blois, is a fine château in a park: it was formerly the abode of Madame de Pompadour, mistress of Louis XV., and subsequently of Maréchal Victor, duke of Belluno. It is now the residence of Prince Joseph de Chimay.

In the arrondissement of Vendôme are Vendôme, or Vendosme, Morée, Freteval, Les Roches, Montoire, and Troo, all on the Loir; Mondoubleau and Savigné on the Grenne; Droué and La Ville aux Clercs. Vendôme is on the Loir, which here flows in several channels; the two principal streams divide the town itself from the suburbs. A hill which commands the town is crowned by the ruins of an antient castle, the residence of the former dukes of Vendôme, destroyed during the troubles of the Revolution. The tombs of the princes of the house of Bourbon were on this occasion violated. The town is ill laid out, and by no means well built. It has a college of long established and deserved reputation. The cloisters of a fine Benedictine convent have been converted into barracks and the grounds into public walks; the conventual church has been made parochial. The population of Vendôme was, in 1831, 6590 for the town, or 7771 for the whole commune; in 1836 it was 8206 for the commune. The principal manufactures are of gloves, once very considerable but now decayed, paper, leather, and woollen stuffs. There are public baths, and some judicial and other government offices. Vendôme was antiently fortified, and was taken by storm by Henri IV. from the party of the League. The walls are now destroyed. It was the birth-place of the French poet Ronsard. Vendôme was formerly capital of the district of Vendômois, a subdivision of Dunois, or Beauce [BEAUCE], and gave the title of count, afterwards of duke, to a branch of the house of Bourbon, which in the person of Henri IV. came to the throne. The duchy was subsequently granted to a natural son of Henri, who, with his descendants, acted a conspicuous part in the political and military affairs of France. Louis Joseph, duke of Vendôme, A.D. 1654—1712, was the last duke of that line, and was one of the ablest and most successful generals of Louis XIV. The victories which he gained at Brihuega and at Villa Viciosa, in 1710, re-established Philippe V. on the throne of Spain. Mondoubleau (pop. 1656 town, 1917 whole commune) has the remains of an ancient castle; the townsmen manufacture some serges and other woollens, earthenware, and glass. Montoire, otherwise called Querhoent (pop. 2433 town, 3072 whole commune), has a good square formed by a former duke of Tallard; the inhabitants manufacture serges and other woollens. In the arrondissement of Vendôme as many as seven hundred foundlings are brought up at the charge of the charitable institutions of Paris.

In the arrondissement of Romorantin are Romorantin, St. Genoux, La Ferté-Imbault, and Salbris on the Sauldre; Mennetou and Selles on the Cher; and La Ferté St. Aignan on the Beuvron. Romorantin gets its name from the Morantin, a brook which flows into the Sauldre at this spot. It was formerly the capital of the barren district of Sologne: and was the place from which the chancellor L'Hôpital issued an edict (called the edict of Romorantin) which prevented the establishment of the Inquisition in France. The population was, in 1831, 6537 for the town, or 6985 for the whole commune; in 1836 it was 7181 for the commune. The principal manufacture is that of woollen cloth. There are some fiscal and other government offices here. Selles (pop. 1915 town, 4121 for the whole commune) has an antient castle. The inhabitants manufacture some woollen goods. There are several corn-mills. La Ferté Imbault has a château or castle, which was in the time of Louis XIV. the residence of Maréchal d'Estampes.

The population of the above places, when not otherwise mentioned, is that of the whole commune, and from the census of 1831.

The department of Loir et Cher constitutes the diocese of Blois, the bishop of which is a suffragan of the archbishop of Paris: it is included in the circuit of the Académie Universitaire and in the Cour Royale of Orléans. It is in the fourth military division, the head-quarters of which are at Tours. It sends three members to the Chamber of Deputies. In respect of education it is backward as compared with the rest of France: of the young men enrolled in the military census of 1828-29, only 27 in every 100 could read and write; the average of France being nearly 40 in every 100.

This department was in the days of Cæsar occupied by the Carnutes and the Turones. The greater part of it afterwards constituted the Blaisois, or Blésois [BLOIS], but the department also includes part of the former districts of Touraine, Orléanois proper, and Dunois. It contains a great many châteaux.

LOIRE, a river in France, the basin of which is bounded on the east by the Cévennes, and the mountains which form their prolongation northward; by the mountains of Morvan, the heights of Beauce, and the Menez mountains on the north; and on the south and south-west by the mountains of La Margeride, the volcanic group of Auvergne, and the heights of Gâtines, which extend from the Auvergnat group to the Atlantic.

The limits thus described include a large portion of the centre and western parts of France, constituting nearly a fourth part of the whole country. The greatest length of the basin is from north-west to south-east, from the source of the Varenne, a feeder of the Mayenne, to Mount Lozère, 370 miles; its greatest breadth is from the source of the Bouleur, which flows by the Clain into the Vienne, to the source of the Arroux, 224 miles. Its area is estimated at 50,783 square miles, or about that of England.

The Loire rises in Mount Gerbier des Joncs, one of the Cévennes in the neighbourhood of Mount Mézin, several miles north-north-east of Mount Lozère, in the department of Ardèche. Its source is nearly 4600 feet above the level of the sea. The general direction of its course is at first north and north-west to Orléans, where it turns westward and flows into the Atlantic. Its first great tributary, the Allier, unites with it on the left bank, just below Nevers, at an elevation of 550 feet above the level of the sea, and at a distance of about 210 miles from its source. In the upper part of its course, above the junction of the Allier, the valley of the Loire is narrow, being bounded on the east by the prolongation of the Cévennes, which form the eastern limit of its basin, and on the west by a branch from the Cévennes, which divides the valley of the Loire from that of the Allier. The tributaries of the Loire, until the junction of the Allier, are all small; the Arroux alone, which joins it on the right bank, is navigable.

From the junction of the Allier to Orléans is a distance of nearly 100 miles, following the general course of the stream. The height of the bed of the Loire at Orléans is about 294 feet above the level of the sea. The Cher and Indre, two of its most important tributaries, join it on the left bank, 90 miles below Orléans, and not far below Tours, at an elevation of about 160 feet.

From the junction of the Cher and Indre, the Loire has a general western course of 133 miles, till it reaches the ocean. It receives, on its left bank, about 12 miles below the junction of the Cher, the Vienne, another of its great tributaries; and 36 miles lower down it receives the Maine or Mayenne, the only stream of magnitude which falls into it on the right bank throughout its whole course. At the junction of the Mayenne the height of the bed of the river is about 115 feet; and at Nantes, 48 miles lower down, and only 36 miles from the mouth of the river, [illegible] feet above the level of the sea.

The whole course of the Loire is above 530 miles. The navigation upwards and downwards commences at Roanne, 116 miles from its source, where it is joined by the Trambouze. It has, in the part above Roanne, a total fall of 3772 English feet, being an average of about 32·5 feet in a mile. The chief fall is in the part nearest its source. For two-thirds of the distance above Roanne it is used for floating timber, particularly of deals for boat-building; and boats can descend the stream from St. Rambert, above Roanne, but not ascend it.

This river, with its larger affluents, constitutes the great outlet for the produce of central and western France, and might be rendered much more available. The banks are celebrated for their beauty, particularly in the neighbourhood of Tours. From the melting of the snows in the Cévennes, in which it has its source, the Loire is subject to great inundations, to prevent which it has been embanked in the level tracts below Orléans. The sand and soil which its waters bring down form islands or shifting banks in its course, which materially impede the navigation, especially above Orléans: to avoid this inconvenience, a canal has been formed along the left bank of the river from the Canal du Centre, at the junction of the Arroux, to the Canal de Briare, at Briare near Gien. Vessels of 900 tons are built at Nantes, but they cannot receive their cargoes above Paimbœuf. The tide flows about forty miles up the river, to a short distance above Nantes.

Two of the five great affluents of the Loire have been described elsewhere. [ALLIER; CHER.] The Allier rises in Mount Lozère, a few miles from the source of the Loire, and has a course of about 200 miles, nearly parallel to that of the Loire. It is navigable, during part of the year, for about 72 miles. The Cher rises near the Puy de Dôme, and has a course of nearly 200 miles, for about 55 of which it is navigable. It passes Montluçon, St. Amand, and Bourges.

The Indre rises in the remote ramifications of the central group of the mountains of Auvergne, and has a course of about 116 miles. The navigation, of 36 miles, commences at Loches. The Indre has no large affluents.

The Vienne rises in the Auvergnat mountains, west of the Puy de Dôme, and flows, first west past Limoges, and then north, past Chinon. Its whole course is about [illegible] miles, only about 50 of which are navigable, viz. from the junction of the Clain. It drains a large extent of country and receives several considerable affluents.

The Mayenne rises in the southern slope of the Armorican chain, and has its course first west, and then south past Mayenne, Laval, and Angers, just below which it joins the Loire: its whole course is about 97 miles, for half of which, viz. from Laval, it is navigable. Though not so long as the Allier, the Cher, the Vienne, or even the Indre, its basin exceeds that of any of them, except the Vienne. Its principal feeder is the Sarthe, a stream [illegible] miles longer than the Mayenne, which flows by Alençon and Le Mâns, and is navigable from below Le Mâns, [illegible] miles. The Sarthe receives the Loir (distinguished from the great stream, La Loire, by its masculine form Le Loir), a river of almost equal length with itself, which is navigable from Château du Loir, 53 miles.

The Loire was known to the Romans by the name Liger (Λείγηρ, Strabo) or Ligeris; the Allier by those of Elaver and Elauris. We are not aware that the Roman names of any of the other tributaries have been recorded.

We subjoin the following summary of the navigation of this vast river-system from the official statements of the French government:—

	Miles.
Length of the navigation of the Loire itself	512
Arroux	12
Allier	156
Loiret	2
Vienne, 55 miles; Creuse, 5 miles	60
Thouet, 11 miles; Dive, feeder of Thouet, 17 miles	28
Authion	26
Mayenne, 60 miles; Oudon, feeder of Mayenne, 11 miles; Sarthe, 80 miles; Loir, 75 miles	226
Layon	37
Sèvre Nantaise	10
Acheneau, 12 miles; Boulogne, 5 miles; Ognon, 4 miles; Tenu, 10 miles, feeders of the Acheneau	31
Èvre	16

The navigation of the Indre is not stated; that of the Cher is comprehended in the Canal du Berry, and that of the Erdre, a small feeder which joins the Loire at Nantes, in the canal from Nantes to Brest. From the length assigned to the Loire itself, the Allier, the Sarthe, and the Loir, as compared with that given above, from measurement on Brué's large map (Paris, 1816), either inland navigation has been much extended of late years, or that part of the stream used for floating timber is included in the navigation. The Loire is connected with the Saône by the Canal du Centre, with the Seine by the Canals de Briare, d'Orléans, and du Loing, and with Brest harbour by the canal from Nantes to Brest. The Canal du Berry unites the upper and lower parts of the Loire, avoiding the great bend of the river at Orléans.

LOIRE, a department in the interior of France, bounded on the north by the department of Saône et Loire, on the east by the departments of Rhône and Isère, on the south-east by the department of Ardèche, on the south by that of Haute Loire; on the south-west and west by that of Puy de Dôme, and on the north-west by that of Allier. The form of the department is irregular; the greatest length is from north-north-west to south-south-east, from the neighbourhood of La Palisse (Allier) to that of Bourg Argental, 80 miles; its greatest breadth, at right angles to the length, is by a line drawn through Roanne, 41 miles. The area of the department is estimated at 1835 square miles, being about equal to that of the English county of Northumberland. The population in 1831 was 391,216; in 1836 it was 412,497, showing an increase in five years of 21,281, or more than five per cent.; and giving about 225 inhabitants to the square mile, a population which, in density, far exceeds the average of France, and is nearly double that of the English county compared with it. Montbrison, the chief town, is in 45° 36′ N. lat. and in 4° 4′ E. long.; 236 miles south-south-east of Paris in a direct line, or 290 miles by the road through Montargis, Nevers, and Roanne.

This department is formed of a portion of the valley of the Upper Loire, and its eastern and western boundaries are skirted by the mountains which bound that valley on each side. On the east side are the mountains of La Lyonnais, dividing the basin of the Loire from that of the Rhône. The highest points are Mont Pilat (Mons Pileatus, 'the capped mountain'), so called from its head being often enveloped with clouds, 4479 feet above the level of the sea, and Riossiare, or Rossoye, between Pannissière and Tarare (Rhône), 3221 feet. In the south-east the department extends across these mountains to the banks of the Rhône. On the west side of the department are the heights of Forez and La Mado, otherwise La Madeleine, separating the valley of the Loire from that of the Allier. These two mountain-chains are chiefly composed of granitic rocks or of the older limestones and sandstones; part of the high ground between the Loire and Rhône is occupied by the coal-measures; and the valley of the Loire is occupied by strata belonging to the supracretaceous group. The coal-field of this district is the most important in France. There are forty-five mining establishments, which extend over an area of 12,932 English acres. The quantity procured in 1835 was 912,214 tons; and the distribution of their produce is facilitated by the two noble rivers to which the coal-field is adjacent. The quality of the coal is very good. There are iron and lead mines in the mountains, and quarries of granite, porphyry, and marble. Whetstones and slates are also procured.

The department belongs almost entirely to the basin of the Loire, which river enters it on the south, just below Aurec (Haute Loire), and flows northward, past St. Rambert (where the downward navigation commences), Feurs, and Roanne (where it becomes navigable, both upward and downward), into the department of Saône et Loire. From the narrowness of the valley through which it flows, its tributaries are all small; the Furand, the Coise, the Loise, the Trambouze, and the Sornin join it successively on the right bank; and the Bonson, the Mare, the Lignon, the Aix, the Renaison, and the Tessonne, on the left. A small portion of the south-eastern extremity of the department belongs to the basin of the Rhône, and is skirted by that river, which divides it from the department of Isère. The Gier and the Déaume, which belong to the system of the Rhône, water this part. The official returns make the navigation of the Loire in this department amount to 68 miles, which extends it far above Roanne or St. Rambert, and shows either that the upper part has been made navigable of late years or that the part used only for floating timber is included in the return. About five miles of the navigation of the Rhône belong to this department.

There are two canals: that from Roanne to Digoin, lateral to the Loire, 11 or 12 miles of which are in this department; and that from Rive de Gier to Givors (Rhône) on the banks of the Rhône, of which four or five miles are in this department.

There are six government roads, having an aggregate length of 192 miles, of which nearly three-fourths are in repair, the rest out of repair or unfinished. There are eleven departmental roads, having an aggregate length of 231 miles, about two-thirds of which are in good repair. There are four thousand four hundred and twenty-four bye-roads and paths, with an aggregate length of nearly 5000 miles. The principal road is that from Paris by Moulins to Lyon; it passes through Roanne. The road from Lyon to Nîmes crosses the south-east corner of the department, that from Lyon to Clermont passes through Feurs and Boën; and that from Lyon to Le Puy passes through St. Etienne. There is a railroad from St. Etienne to Lyon.

The climate of the department is temperate, and the soil, though not distinguished by fertility, tolerably productive. About half the soil is arable, but the quantity of grain is not sufficient for the dense population. There is a considerable proportion of meadow-land, on which a great number of cattle are bred. The cheeses of La Roche and Sarrasin, villages in the department, are much esteemed. The vineyards are tolerably extensive, and some of the wine is in good repute. A small quantity of cider is made. The quantity of poultry reared is considerable, especially turkeys, which are fattened on chesnuts. The woods occupy rather more than an eighth of the department; they consist chiefly of pines and other resinous trees, from which excellent turpentine is obtained. The deals are sent down the Loire for boat-building and other purposes.

The department is divided into three arrondissements, as follows:—

		Area in Sq. Miles.	Population in 1831.	Population in 1836.	Communes.
Roanne	N.	688	121,817	124,871	108
Montbrison,	Central	749	120,210	124,050	139
St. Etienne,	S.E.	398	149,189	163,576	72
		1835	391,216	412,497	319

There are 28 cantons or districts, each under a justice of the peace.

In the arrondissement of Roanne are Roanne, on the Loire (population in 1831, 8890 town, 9260 whole commune; in 1836, 9910 commune) [ROANNE]; Villerest, near Roanne, on the same river; Perreux, also near Roanne, but not on the Loire; Charlieu (pop. 3123 town, 3424 whole commune), on the Sornin; Regny, Lay, St. Symphorien de Lay, and St. Just, on the Trambouze, or its branches; Néronde, on a small stream running into the Loire; St. Germain la Val and St. Just en Chevalet, on the Aix; St. Haon le Châtel and Renaison, on or near the Renaison; Aubierle, Changy, Crozet, and La Paraudière, on or near the Tessonne. These are almost all small places. Perreux is famous for its wines. St. Symphorien de Lay (pop. 4500) has considerable cotton-manufactures; the town, which is walled, does not contain much above a fourth of the population of the commune. La Paraudière is a tolerably pleasant town of 600 or 700 inhabitants. St. Just en Chevalet is on the slope of a hill: it has about 1000 inhabitants, who make hats and trade in the wood grown in the neighbourhood.

In the arrondissement of Montbrison are Montbrison, capital of the department, on the Vizezy, a small feeder of the Lignon; Moingt and Chaudieu, both near Montbrison; L'Hôpital and Boën, on the Lignon; St. Marcellin and Sury-le-Contal, on or near the Maire; St. Bonnet-le-Châtel, near the Bouson; St. Rambert and Feurs, on or near the Loire; Panissière, near the Loire; and Chazelle and Galmier, or St. Galmier, near the Coise or Croize.

Montbrison, built in the twelfth century, was the capital of the district of Forez. The town is commanded by a picturesque volcanic rock, from the top of which, in the religious wars of the sixteenth century, the Baron des Adrets, a Huguenot leader, is said to have precipitated his Catholic prisoners. The town is ill laid out and ill built; but great improvements have been made in the course of the present century by filling up the ditches which previously surrounded the town, and forming a handsome boulevard on the site of them, and by laying out and building new streets. The college, or high-school, formerly an Ursuline nunnery, has been so enlarged and embellished as to become a handsome structure. There are a theatre and a fine range of barracks for cavalry. The courts of law, the church of St. Marie, and the corn-market are handsome buildings. The population in 1831 was 5040 for the town, or 5265 for the whole commune; in 1836 it was 6266 for the commune. The townsmen manufacture some linens of different fineness. There are a small public library, an agricultural society, a botanic garden, and the different public offices necessary in a departmental capital. There are public baths, and in the neighbourhood are some mineral waters, which were known to the Romans. Some Roman antiquities have been discovered near the town, and among others the ruins of an amphitheatre.

Feurs was the Forum Segusianorum of the Romans, the antient capital of the Segusiani: it gave name to the district of Forez. Many of the houses have cellars evidently of Roman construction. There are numerous vestiges of Roman monuments. Remains of aqueducts extend for more than a mile from the town. The traces of the antient walls show the extent and importance of the place. There is an antient cromlech near the town. St. Galmier (pop. [illegible] town, 2659 whole commune) has some manufactures of wax tapers for use in churches: near the town are some mineral waters. Boën has a population of about 1500: there is a paper-mill, and some trade is carried on in the corn, wine, and wood of the surrounding country. L'Hôpital has about 1000 inhabitants.

In the arrondissement of St. Etienne are St. Etienne, on the Furens (pop. in 1831, 33,064; in 1836, 41,534) [ETIENNE, ST.]; Bourg Argental, on the Diaume; St. Sauveur and St. Julien, in the neighbourhood of Bourg Argental; Le Chambon and Firmini, on a small feeder of the Loire; St. [illegible], on another small feeder of the same river; Chavanay and Condrieu, on or near the Rhône; St. Chamond and Rive de Gier, on the Gier; Chagnon, Romain, and La Fouillouse.

At Bourg Argental (pop. 1734 town, 2502 whole commune) crapes and some other silk fabrics are made from the silk produced in the canton of Pellusin near the Rhône, where the mulberry-tree is cultivated on a large scale. At Le Chambon (pop. 1600) coal-mines are wrought, ribands are woven, and nails, files, and knives manufactured. Firmini (pop. 2435 town, 3779 whole commune) has also productive coal-mines, and has the same manufactures as Le Chambon. St. Chamond (pop. 7475) is situated in a hollow, the environs of which are adorned by orchards, woods, and vineyards. Several of the houses are handsome, and have pleasant gardens. The parish church is a handsome building: there are public baths and a pleasant public walk. Some vestiges of Roman antiquities have been found near the town. The inhabitants are engaged in throwing silk and weaving ribands, in working coal-mines, and in the manufacture of nails or cast-iron. There are quarries of freestone in the neighbourhood. Near Rive de Gier (pop. [illegible] town, 9706 whole commune) are extensive coal-mines: the pits are above 950 feet in depth, and one pit is said to be nearly 1100 feet deep. There are iron-works in the town, several glass-houses and a silk-throwing mill. The smoke and dust from these various establishments blacken the whole place, and render it always dirty. There is a basin [illegible] of the canal, which communicates between this town and Givors on the Rhône. Lyon is supplied with coal from this neighbourhood. Some of the coal strata in this arrondissement have been in a state of combustion for centuries. Muriate of ammonia is procured where this combustion is going on.

The population of the above towns, where not otherwise distinguished, is that of the commune, and is from the census of 1831.

The chief branches of industry in the department have been noticed above. They depend almost entirely on the abundant supply of fuel furnished by the coal-mines of the department. In addition to those already mentioned, the manufacture of coarse woollen cloths, of cotton twist, of linen and cotton fabrics, and leather, may be noticed.

The department of Loire forms, with that of Rhône, the archiepiscopal diocese of Lyon and Vienne. It is in the jurisdiction of the Cour Royale and the circuit of the Académie Universitaire of Lyon; it is included also in the nineteenth military division, the head-quarters of which are at Lyon. It sends five members to the Chamber of Deputies.

The state of education in this department is backward. In the military census of 1828-29 only 29 of every 100 young men enrolled could read and write; the average number in all France being about 39 in every 100.

This department comprehends the antient territory of the Segusiani, with portions of some of the adjacent states: in the division of Gaul under the Romans it was included in the province of Lugdunensis Prima. Some Roman towns were included within it, as Forum Segusianum, *Feurs*; Rodumna, *Roanne*; Aquæ Segete, perhaps Aissumin, a village on the bank of the Loire; and Carilocus, a town of the Ædui, *Charlieu*. It includes the former district of Forez and portions of Le Beaujolais and Le Lyonnais properly, all subdivisions of the province of Lyonnais. At the commencement of the Revolution the departments of Rhône and Loire constituted but one, under the title of Rhône and Loire; they were subsequently divided.

LOIRE, HAUTE, a department in the interior of France, bounded on the north by the departments of Puy de Dôme and Loire; on the east and south-east by that of Ardèche, on the south and south-west by that of Lozère; and on the west by that of Cantal. Its form is irregular. Its greatest length is from east to west, from near Bresle to between Montfaucon and Bourg Argental (Loire) 68 miles; greatest breadth from north to south is from near Craponne to the neighbourhood of Pradelles, 44 miles. Its area is estimated at 1931 square miles, which is considerably below the average extent of the French departments, but exceeds by 60 square miles that of the English county of Northumberland. The population in 1831 was 292,078. In 1836 it was 295,384, showing an increase in five years of 3306, or little more than one per cent., and giving about 153 inhabitants to a square mile, which is rather under the average density of the population in France: but considerably above that of Northumberland, with which county we have compared it in respect of area. Le Puy, the capital, is on the left bank of the Loire, in 45° 2′ N. lat. and 3[illegible] E. long., 271 miles south by west of Paris in a direct line, or 304 miles by the road through Nevers, Moulins, and Clermont.

The department is almost entirely mountainous, at least hilly. The chain of the Cévennes passes just along eastern boundary; the mountains of La Margeride, which unite the Cévennes to the central group of Auvergne, pass along the south-western boundary; and a branch of the Cévennes, which separates the valleys of the Allier and the Loire, passes northward through the middle of the department, from Pradelles to La Chaisedieu. Nearly the whole of the department is occupied by these mountains and their branches; and the only tracts that approach to a more level character are on the north side of the department, where the valleys of the Loire and the Allier expand to some breadth. The mountains consist for the most part of granite and the other primitive rocks, mingled with basalt and lava, the product of volcanoes long since extinct. The valley of the Allier is occupied by the supracretaceous strata. The mountains are in many places of picturesque form. Mont Mézin, or Mézene, is a colossal mountain of volcanic matter, rising more than 5000 feet above the granite on which it rests; and having a total elevation of 5816 feet above the level of the sea. This mountain, which belongs to the principal range of the Cévennes, presents some magnificent ranges of basaltic columns. In the same line as

Mont Tartas, Les Infernels, Mont Caou, or Mont Chaud, and others; all mountains of similar volcanic origin and character: Tartas has an elevation of 3410 feet above the level of the sea. The currents of volcanic matter ejected in a state of fusion from these or other mountains appear to have interrupted in several places the course of the Loire and the Allier, and obliged those streams to work out a more circuitous channel. In many places however the channels of the rivers penetrate through the volcanic rocks. The names of several of these extinct volcanoes appear to have had a Roman origin. Tartas, or Tartarus, reminds the Latin Tartarus; and Les Infernels, or Infernès, the Latin Infernus. The most striking ranges of basaltic columns in the department are those of St. Arcons d'Allier near Langeac on the Allier; Esplay near Pradelles; and Espailly, Polignac, and others, near Le Puy, in the valley of the Loire.

The mineral treasures are coal, lead, and antimony; granite, serpentine, statuary and other marbles; excellent freestone for building, sandstone for mill-stones, and gypsum. The quantity of coal produced in 1835 was 21,882 tons: it is the eighth of the departments in respect of its production of this mineral. The chief coal-pits are at Frugères.

The principal rivers are the Loire and the Allier, which enter the department on the south, the Loire from the department of Ardèche, the Allier from that of Lozère, in which departments they respectively have their rise on each side of the central mountain-range already described. The valley of the Loire separates the central mountain-range from that of the Cévennes; and is very narrow, except in the northern part of the department. The river flows by or near Le Puy, Roche en Regnier, Beauzac, Monistrol, Bas-en-Basset, and Aurec. Its tributaries are all small. The valley of the Allier, which separates the central mountain-range from that of La Margeride, is also narrow, except just in the north part of the department. This river flows by or near Langeac, Brioude, and Auzon; its chief tributaries are the Chapeauroux (which joins it just within the department), the Ance, the Senouire, and the Alagnon. There are in the mountains several small lakes, or rather ponds.

In the official returns the Allier is stated to be navigable for ten or eleven miles in this department: probably from Brioude, where many boats are built. As in other authorities the commencement of the navigation is marked as being a little above Vichy (Allier), about sixty miles lower down, it is probable that in this upper part of its course boats can only descend the stream, not ascend it. There is no other inland navigation.

There are six Routes Royales, or government roads, in the department, having an aggregate length of 181 miles; of which (1st Jan. 1837) 123 were in repair, 22 out of repair, and 36 unfinished. The principal road is that from Paris by Clermont and St. Flour to Narbonne and Perpignan, and so into Spain; this just passes through the north-western corner of the department, through the little town of Lempde, on the Alagnon. From Lempde a road branches off to Brioude, Paulhaguet, and Le Puy. From Le Puy roads run to Ambert and other towns in the department of Puy de Dôme, to La Voulte (Ardèche) and other towns on the Rhône, to Pradelles and to Yssengeaux. From Pradelles are roads to Mende (*Lozère*) on the one hand, and on the other to Aubenas, Privas, and Viviers (Ardèche); and from Yssengeaux are roads to St. Etienne (Loire), and to Annonay (Ardèche). The Departmental Roads, twelve in number, have an aggregate length of about 250 miles, of which only about 100 miles are in repair. There are more than three thousand eight hundred bye-roads or paths, having an aggregate length of more than 3700 miles.

It is probable that the lowest part of the department is nearly 1000 feet above the sea level; and the summits of the highest mountains exceed 5000 feet. The climate is too cold to admit of the cultivation of the vine, except in a few more sheltered spots, as in the bottom in which the town of Le Puy stands; and there are some parts where it is too cold to admit the growth even of rye. The soil is of middling fertility. In the vague classification of the government papers three-fifths are said to be 'sandy,' nearly three-tenths stony, and the rest gravel, chalk, or limestone, with a very small proportion, about 2000 acres, of rich loam. Nearly half the land is under the plough, and the produce in grain exceeds the consumption of the department. The vineyards occupy 13,000 to 15,000 acres, but the growth of wine is inadequate to the supply of the department. The quantity of meadow land is considerable; and the heaths, or commons and open pastures, occupy nearly one-fifth of the surface. The breeding of cattle, and still more that of sheep, is much attended to. Mules are bred in considerable number. There are many bees kept; and in some spots silkworms are reared. Chestnuts are grown in large quantity; some kinds of fruit are cultivated to a considerable extent. The woods occupy more than a seventh of the whole department.

The department is divided into three arrondissements, as follows:

	Sq. Miles.	Population in 1831.	1836.	Communes.
Le Puy, Central and S.	560	119,922	120,844	112
Yssengeaux, or Issengeaux, N.E.	463	91,564	91,785	44
Brioude, N.W.	608	80,592	82,755	110
	1631	292,078	295,384	266

It is subdivided into twenty-eight cantons, or districts under a justice of the peace.

In the arrondissement of *Le Puy* are Le Puy (population in 1831, 14,844 town, 14,930 whole commune; in 1836, 14,924 commune) on the Borne, a feeder of the Loire, not far from that river; Allègre and St. Paulien (pop. 3017) near the Borne; Craponne (pop. 2274 town, 3828 whole commune) and Chomelix near the Arzon, which also joins the Loire; Roche en Regnier, on the Loire; Fay le Froid, on the Lignon, another feeder of the Loire; Monastier (pop. 1983 town, 3420 whole commune), on the Gazeille, a small feeder of the Loire; Pradelles, on a small feeder of the Allier; and Saugues (pop. 1884 town, 3893 whole commune) on the Seujols, another small tributary of the Allier.

Le Puy is described elsewhere. [PUY, LE.] The immediate neighbourhood of the city is remarkable for the picturesque forms of its volcanic rocks. That of Corneille, which immediately commands the town, is of the form of an immense cube; the rock of Polignac (mentioned above) is an oblong square, three sides of which are precipitous, crowned with the ruins of an antient castle; that of St. Michel is a lofty cone, above 300 feet high, having a church with a steeple on its summit, so that it appears, in a distant view, like a vast obelisk: the ascent to the church is by a flight of two hundred and sixty steps in the side of the rock. The rocks of Espailly are in the same neighbourhood; they have been noticed already, in speaking of the geological character of the department. There are some remarkable caverns near Le Puy. At the base of the rock of St. Michel is an antient building said to have been a temple of Diana; and on the face of that of Polignac is a coarsely sculptured head of Apollo. There are the ruins of an old castle in the same neighbourhood. Le Puy is on a site elevated more than 2000 feet above the level of the sea. Pradelles is yet higher: its site, which consists partly of granitic, partly of volcanic rocks, is 3721 feet above the level of the sea: it contains about 1200 to 1500 inhabitants.

In the arrondissement of Yssengeaux are Yssengeaux, or Issengeaux, between the Terrasse and the Lignon, feeders of the Loire; Beauzac, Monistrol (pop. 4145), Bas en Basset (pop. 5824), and Aurec, on or near the Loire; St. Didier la Seauve (pop. 1993 town, 3725 whole com.), on a feeder of the Loire; Montfaucon, near the Dunières, which flows into the Lignon; and Tence (pop. 5730), on the Lignon.

Yssengeaux is a small town, with a population, in 1831, of 3133 for the town, or 7166 for the whole commune; in 1836, of 7621 for the commune. The roofs of the houses are commonly covered with basalt. There is an Agricultural Society in the town. A rich lead-mine is wrought in the neighbourhood, and peat for fuel is dug. Monistrol has an antient palace of the bishops of Le Puy, remarkable for its lofty situation. The townsmen manufacture locks, leather, ribands, and lace. Montfaucon has a population of from 1200 to 1500.

In the arrondissement of Brioude are Brioude (pop. in 1831, 5052 town, 5039 whole commune; in 1836, 5247 commune); Langeac (pop. 2345 town, 3109 whole commune), Vieille Brioude, close to Brioude, La Motte, and Auzon, all on or near the Allier; Blesle on the Voureze, a feeder of the Alagnon; Lempde on the Alagnon, Paulhaguet on the Senouire, and La Chaise-dieu, near the source of the same river. Brioude and Vieille Brioude are described elsewhere. [BRIOUDE.] Antimony, millstones, and whetstones are quarried in the neighbourhood of Langeac. Lempde is in a fertile district; it has a population of about 1000: there is a bridge over the Alagnon. Excellent coal is dug in the neighbourhood. At the village of Veze-[illegible], on the Allier, many boats are built for the navigation of that river.

The manufactures of the department consist chiefly of thrown silk, lace, paper, and woollen stuffs; skins for holding wine or other liquids; bells for horses and mules, glass, and leather. The trade consists in the sale of the foregoing articles, grain, chesnuts, dried pulse, sheep, mules, and deals. Three thousand individuals leave the department yearly to obtain employment in other departments as sawyers, [illegible], chimney-sweeps, porters, &c.

This department constitutes the diocese of Le Puy, the bishop of which is a suffragan of the archbishop of Bourges. It is in the jurisdiction of the Cour Royale of Riom, and in the circuit of the Académie Universitaire of Clermont Ferrand. It is in the nineteenth military division, the head-quarters of which are at Lyon. It returns three members to the Chamber of Deputies. There is a Protestant consistorial church.

In respect of education, it is one of the most backward of the French departments. Of the young men enrolled in the military census of 1828-29 only 21 out of every 100 could read and write; being very little more than half the average number in France taken as a whole.

This department was the country of the Vellavi, a Celtic tribe whose chief town was Revessio, now St. Paulien near Le Puy. Under the Romans it was included in Aquitania Prima. It afterwards came into the hands of the Visigoths, then of the Franks, and in the middle ages formed part of the extensive dominions of the Counts of Toulouse, to whom it is probable that the bishops of Le Puy, who held the county of Le Vélay (as, from the name of its antient inhabitants, the district was called) were subject. From the Counts of Toulouse the district came to the crown of France, under which it constituted part of Languedoc. The department comprehends, besides Le Vélay, some portions of Le Vivarais and Le Gévaudan (two other subdivisions of Languedoc), of the duchy of Auvergne, in the province of Auvergne, and of the district of Forez in Le Lyonnais.

LOIRE INFE'RIEURE, a maritime department of France, bounded on the north-west by the department of Morbihan; on the north by that of Ille et Vilaine; on the north-east, for a little space, by that of Mayenne; on the east by that of Maine et Loire; on the south by that of Vendée; and on the west by the Atlantic ocean. Its form is irregular. Its greatest length is from east to west, from Ingrande (Maine et Loire) on the frontier of this department to the Pointe de Piriac, north of the little town of Le Croisic, 75 miles: its greatest breadth, at right angles to the length, is from the village of Soulvache, not far from [illegible], to the little town of Legé, near the head of the [illegible], a small stream that flows into the lake of Grand Lieu, [illegible]. The area of the department is estimated at 2639 square miles, being rather greater than that of the English county of Devon. The population in 1831 was 470,093, in [illegible] it was 470,76[illegible], showing an increase in five years of [illegible] 675, or about one-seventh per cent., and giving 178 inhabitants to a square mile. In area, in population, and in density of population it is considerably above the average of France; but in the last two particulars it is inferior to the English county with which we have compared it. Nantes, the chief town, is on the north bank of the Loire, at the junction of the Erdre; in 47° 13′ N. lat. and 1° 33′ W. long., [illegible] miles west-south-west of Paris in a direct line, or [illegible] miles by the road through Versailles, Chartres, Le Mans, and Angers.

The coast of this department presents a broken and irregular [illegible]. It commences at the bottom of the little bay of [illegible], south of the æstuary of the Vilaine, where the boundary between the departments of Morbihan and Loire Inférieure meets the ocean. This coast-line then forms the headland of Pointe de Piriac and Pointe du Croisic, with the intervening bay or road-stead of Pembron, and proceeds south-east, forming a second shallow bay between the [illegible] of Le Pouliguen and St. Sebastien, to [illegible] the Loire, which is about seven miles wide. [illegible], which is on the south side of [illegible] forms the bay of Bourgneuf, [illegible] at the mouth of the little [illegible], the boundary of the departments of Loire Inférieure and Vendée meets the ocean. Belle Ile, opposite the Pointe de Piriac, belongs to the department of Morbihan; and Ile de Boin and Noirmoutier, of which the former is in the bay of Bourgneuf, and the second off the entrance of it, belong to the department of Vendée. The town of Le Croisic is on a headland insulated at high water, but at other times connected with the mainland by the sand. The whole length of the coast is nearly fifty miles: it is for the most part low and skirted by broad sands. The [illegible] brought down by the Loire and other rivers is causing the land here to gain gradually on the sea. In estimating the maritime facilities of the department, the wide æstuary of the Loire, by which large vessels can get up to Nantes, must be taken into the account. There are considerable salt marshes along the coast.

The surface of the department is generally level, especially in the northern, western, and southern parts. In the north-eastern and eastern parts, the high land, which separates the basin of the Loire from that of the Vilaine, extends to the upper part of the river Erdre. The country slopes gradually towards the west. The Loire has a fall in its course through this department of about 100 feet in nearly seventy miles, of which fall more than 80 feet are below Nantes.

The department is occupied chiefly by the coal-measures and the subjacent strata, covered in some places by alluvial deposits. There are some strata of good coal on the banks of the Loire and the Erdre; the principal coal-works are between Ancenis and Ingrande, and at Nort. In respect of productiveness of coal, this department ranks next to that of Haute Loire, and is the ninth department in France. The quantity raised in 1835 was 21,742 tons. Peat is dug near the mouth of the Loire, on the north bank. Iron-ore is tolerably abundant; and a tin-mine is wrought at Pi[illegible] on the coast. Fine-grained granite, slate, marble of a greyish tint, and limestone are quarried in different places. The loadstone is found on the north bank of the Loire, near the mouth; and crystals of quartz, from which the 'Ale[illegible] diamonds' are made, mica, felspar, kaolin or porcelain earth, and clay for various purposes are procured. There are considerable salt-works in the marshes on the coast.

The most important river is the Loire, which touches the border of the department at Ingrande (Maine et Loire), and forms for about 20 miles the boundary between this department and that of Maine et Loire: its remaining course, which is about 50 miles in length, is within the boundary of this department. The bed of the Loire is in this part [illegible] of small islands, which line its channel. It is navigable throughout its course, for small vessels; large vessels can get up to Nantes, where there is a bridge.

The Vilaine forms, for about 20 miles between Lan[illegible] and Rieux, the north-western boundary of the department, which it separates from those of Ille et Vilaine and Morbihan. It is navigable throughout for small vessels. The Falleron, a small stream not navigable, forms for about eight miles the southern boundary of the department.

The other rivers are feeders either of the Loire or of the Vilaine. The Havre joins the Loire at Oudon; the Erdre, 50 miles long, at Nantes; and the Elier de Mean, or Bri[illegible], above St. Nazaire; all on the north bank. The Erdre, the largest of the three, rises in the department of Maine et Loire, near the town of Cande, flows westward into the department of Loire Inférieure, and turning southward along the little town of Nort, joins the Loire. Just above its junction it expands into a long lake of about a mile and a half broad, and six or seven miles long. The navigation forms part of the canal from Nantes to Brest: it commences below Nort, about 12 miles from the junction of the Erdre with the Loire. The Divate rises in the department of Maine et Loire, and forms the boundary of the two departments till its junction with the Loire: the Sèvre Nantaise joins the Loire at Pont Rousseau opposite Nantes, and the Acheneau at the village of Brezay, between Nantes and Paimbœuf: all these join the Loire on the south bank. The whole course of the Sèvre Nantaise is about 65 miles, about one-third of which is in this department or upon its border: the navigation commences at the village of M[illegible]nières, about 10 miles above its junction with the Loire. The Acheneau is the outlet of the lake of Grand Lieu, a considerable sheet of water, approximating in form to a square with a side of four or five miles. Its area is estimated at 17,000 or 18,000 acres. It receives the Boulogne, [illegible] miles long (augmented by the Logne and the Isoire), on the south, and the Ognon, 25 miles long, on the east. The Tenu, 19 miles long, joins the Achenau just after the latter leaves the lake on the north side. The Ognon, the Boulogne, and the Issoire rise in the department of Vendée. The Achenau is navigable throughout its whole course from the lake of Grand Lieu to the Loire, about 12 miles.

The affluents of the Vilaine are the Cher, 25 miles long; the Don, 40 miles long; and the Isaac, 34 miles long: they belong entirely to this department.

Besides the lake of Grand Lieu, which is the largest inland lake in France, there are nearly six hundred smaller lakes or pools, whose aggregate area is about equal to that of Grand Lieu.

The only canal is that from Nantes to Brest, of which about 60 miles are in this department. The navigation of the Erdre is incorporated in this canal, and is included in the length given above. From the Erdre the canal follows the valley of the Isaac, on the right bank of that river, to the Vilaine.

There are six Routes Royales, or government roads, having an aggregate length of 299 miles, of which 208 were (1 January, 1837) in repair, 45 out of repair, and 46 unfinished. The principal road is that from Paris to Nantes and Paimbœuf. It enters the department immediately after leaving Ingrande (Maine et Loire) on the north bank of the Loire, and proceeds along or near that bank by Varades, Ancenis, and Oudon to Nantes. It crosses the Loire by the bridge at Nantes to Pont Rousseau, and passes along or near the south bank to Paimbœuf. Roads lead from Nantes by Pont Château and Roche Bernard (Morbihan) to Vannes (Morbihan); to Rennes (Ille et Vilaine), one by the village of Derval and another by Châteaubriand; by Pont Rousseau and Legé to Les Sables d'Olonne (Vendée); and by Pont Rousseau and Montaigu (Vendée) to La Rochelle (Charente Inférieure). There is a road from Ancenis by Nort and Blain to Redon (Morbihan). There are also thirteen Departmental Roads, having an aggregate length of more than 200 miles, of which not quite 120 miles are in good repair; the rest out of repair or unfinished. The bye-roads and paths are about 5500 in number, with an aggregate length of about 8000 miles.

The air of the department is mild, but humid: the predominant winds are the south-west and north-east. The thermometer does not commonly exceed 93° (Fahrenheit) in the hottest part of the summer, or fall below 45° or 50° in winter: the mean temperature of the year is about 57°. The department is considered healthy on the whole, though some diseases are promoted by the moisture of the climate.

Nearly half the soil is under the plough: wheat, oats, rye, buckwheat, millet, and a little barley are the kinds of grain chiefly cultivated; the quantity raised is equal to the consumption of the department. Pulse and flax are also grown. Meadow lands occupy nearly a sixth of the department; and heaths, commons, and other open pastures more than a sixth. The number of cattle is great: those on the south bank of the Loire are considered to be of an excellent breed. The horses are small, but well made and spirited. Sheep are not numerous; but attention has been paid of late years to the improvement of the breed. Swine are numerous, and are fed on the acorns from the forests. The vineyards occupy nearly 75,000 acres; they extend all along the left or south bank of the Loire and the coast. The wine is chiefly white, and of middling quality. Apples, cherries, chestnuts, and other fruit are grown. Cider is made from the apple, and a drink resembling it from the service berry. Woods occupy about 80,000 acres: the oak is the principal forest-tree. Wolves, wild boars, and deer of different species are found in these woods. Poultry and bees are kept in considerable quantity. The rivers, the lake of Grand Lieu, and the smaller lakes or pools abound with fish; and the sardine, the sole, the ray, and other fish are caught on the coast. There are oyster-banks on the coast.

The department is divided into five arrondissements, as follows:—

		Area. Sq. Miles.	Population. 1831.	1836.	No. of Communes.
Nantes	S.E.	695	205,597	205,899	66
Ancenis	E.	362	46,703	45,763	27
Châteaubriand	N.E.	449	62,949	63,275	37
Paimbœuf	S.W.	278	42,129	42,580	25
Savenay	N.W.	845	113,292	114,256	51
		2,639	470,692	470,768	206

It is subdivided into 45 cantons, or districts under a justice of the peace.

In the arrondissement of Nantes are—Nantes, at the junction of the Loire and the Erdre; Pont Rousseau, a suburb of Nantes, on the south bank of the Loire; Clisson, on the Sèvre Nantaise; Vallet (population 5957) and Loroux-Bottereau (pop. 4991), between the Sèvre and the Loire; Vieillevigne (pop. 4401), on the Ognon; Legé (pop. 4213) on the Logne; St. Philibert (pop. 3000) on the Boulogne, and Machecoul (pop. 3883) on the Falleron. Nantes had, in 1831, a population of 77,992 for the town, or 87,191 for the whole commune; in 1836 it was reduced to 75,895 for the commune. [NANTES.] Clisson has the ruins of a castle in which the celebrated Olivier de Clisson, constable of France, was born: there is a fine view from these ruins. The town is at the junction of the Sèvre and the Moine; the townsmen (pop. 1928 town, 2132 whole commune) feed cattle and manufacture some linens. Near St. Philibert, on an island in the lake of Grand Lieu, is a Druidical monument; and not far from the adjacent shore of the lake another. The inhabitants of the neighbourhood have a tradition that the lake was formed by a terrible convulsion, in which a town called Herbadilla was swallowed up.

In the arrondissement of Ancenis are Ancenis, Oudon, and Varades (pop. 3505), on the Loire. Ancenis had, in 1831, a population of 3163 for the town, or 3730 for the whole commune: in 1836 it had decreased to 3667 for the commune. [ANCENIS.] Oudon has a lofty and picturesque octagonal tower, and the remains of a castle, said to have been built in the ninth century. The population of the whole commune is probably under 2000, and not above one-third is in the town itself. Varades is by some considered only a village: it is on a rising ground, on the north bank of the Loire, commanding the adjacent valley of that river. The ruins of an old castle crown the neighbouring eminence of La Madeleine. There are important coal-works at Montrelais, in this neighbourhood. They employed many years since about 200 men.

In the arrondissement of Châteaubriand are Châteaubriand, or Châteaubriant, on the Cher; St. Julien de Vouvantes, on the Don; and Nort (pop. 4751), on the Erdre: Châteaubriand had, in 1831, a population of 2927 for the town, or 3709 for the whole commune; in 1836 it had decreased to 3634 for the commune. The town is of antiquated appearance, and is commanded by the ruins of an old castle, the principal front of which formed part of the line of the ramparts. The townsmen manufacture 'sabots,' or wooden shoes, serges, tiles, and bricks; iron is procured in the neighbourhood. This place is noted for conserve of angelica and other confectionery. Several government and departmental roads converge here. Nort carries on some trade with Nantes, in coal from the neighbouring mines, wood for building and for fuel, and iron. At the village of Melleraie, between Châteaubriand and Nort, is a convent, now belonging to the monks of La Trappe; it was formerly a monastery of Bernardin monks. This community of Trappists consisted in 1817 of more than a hundred individuals, partly French and partly English. The English members had joined the community in their own country, where it was settled for some time. At Derval in this arrondissement are some Druidical stones. There was formerly a strong castle at this village.

In the arrondissement of Paimbœuf are Paimbœuf and Le Pellerin, on the south bank of the Loire; Port St. Père, on the Achenau; St. Père en Retz, near Paimbœuf; Pornic and Bourgneuf on the sea; and Machecoul. Paimbœuf is situated in a low marshy flat; it consists of one main street, well built, with a quay along the bank of the Loire. It was, at the commencement of the last century, a hamlet of fishermen; but the increase of the trade of Nantes rendering it desirable to have a station lower down the river, where larger vessels might land or take in part of their equipment, Paimbœuf was chosen; and by the middle of the last century it had become, according to Expilly (*Dictionnaire des Gaules, &c.*), a village of 5000 to 6000 persons. Although it has since been constituted a town, and made the capital of an arrondissement, it seems to have declined; for the population, in 1836, was only 3872. Perhaps however Expilly's statement of the population is incorrect. There is a ship-building yard in the town, in which frigates have sometimes been built. Large vessels commonly and smaller ones frequently discharge part of their cargoes at Paimbœuf, from whence they are forwarded to Nantes in small craft. Bourgneuf (pop. estimated at about 2000), gives name to the bay at the bottom of which it is situated, and in which the sand and mud are gradually accumulating: the former port of Bourgneuf is now dry, except at high-water. A great deal of salt is made along the shore of the bay. Machecoul (pop. 3665) was formerly capital of the duchy of Retz, comprehending all (or nearly all) that part of the department which is south of the Loire.

In the arrondissement of Savenay are Savenay, on a little brook running into the Loire; Couéron (pop. 4053), Donges, and St. Nazaire, on the north bank of the Loire; Guérande and Le Croisic (pop. 2200 town, 2800 whole commune), on or near the sea; Pontchâteau, on the Elier de Mean or Brivé; Blain (pop. 4899), on the Isaac; and Herbignac. Savenay had, in 1836, a population of 2079 for the commune. There are salt-works in the marshes near the town, and the townsmen carry on considerable trade in cattle. At St. Nazaire (pop. 3789) is a singular monument, probably Druidical. Loadstones are found, and peat is dug in the neighbourhood of this town. Guérande (pop. 2041 town, 8190 whole commune) is more populous, wealthy, and commercial than Savenay: there are salt-works here. At Pontchâteau (pop. 3300) a large quantity of wash-leather is manufactured. Blain is described elsewhere. [BLAIN.]

The population, when not otherwise distinguished, is that of the whole commune, and is from the census of 1831.

The manufacturing and commercial activity of this department is considerable. Salt-works are numerous; and there are iron-works. Porcelain, glass, earthenware, pottery, and tiles; bed-ticking and serge in considerable quantity; cotton goods, leather, hats, rope, paper, corks, brushes, brandy, and chemical articles, are made: ship-building, both for the merchant service and for the navy, except ships of the line, is carried on; and the cod, herring, and coast fisheries employ many hands. Trade is carried on from the ports of Nantes and Paimbœuf with all parts of the world; and the navigation of the Loire and its tributaries affords considerable facilities for inland trade.

This department forms the diocese of Nantes, the bishop of which is a suffragan of the archbishop of Tours. It is in the jurisdiction of the Cour Royale, and the circuit of the Académie Universitaire of Rennes; and is included in the twelfth military division, the head-quarters of which are at Nantes. It returns seven members to the chamber of deputies.

In respect of education this department partakes of the backwardness which characterises the whole of Bretagne. Of the young men enrolled in the military census of 1828-29, only twenty-four in every hundred could read and write; the average of France was above thirty-nine in every hundred.

This department constituted the territory of the Namnetes, or Nannetes (Ναμνῖται, Strabo; Ναμνηταί, Ptolomy), one of the Celtic nations conquered by Cæsar. They formed part of the Armorican confederacy broken and subdued by that conqueror in the third year of his command. That part of the department which lies south of the Loire was included in the territory of the Pictones or Pictavi, another Celtic people. In the Roman division of Gaul the territory of the Namnetes was included in Lugdunensis Tertia; that of the Pictones in Aquitania Secunda. Condivicnum, or Condevicnum, the capital of the Namnetes, took in the later period the name Namnetes, or Nannetes, whence its modern name Nantes. Corbilo, another town of the same people, mentioned by Strabo, was on the north bank of the Loire, perhaps on the site of the present Couéron. Ratiatum, a town of the Pictavi, is fixed by D'Anville at St. Pierre, or St. Père en Retz. The district of Retz takes its name from Ratiatum. The department constituted in the middle ages a portion of Lower Bretagne, and partook of the fate of that province. [BRETAGNE.] The western part about Pont Château constituted the duchy of Coislin; the western part south of the Loire constituted the duchy of Retz.

LOIRET, a department in the central part of France. It is bounded on the north by the department of Seine et Oise; on the north-east by that of Seine et Marne; on the east by that of Yonne; on the south-east, for a short space, by that of Nièvre; on the south by that of Cher; on the south-west by that of Loir et Cher; and on the north-west by that of Eure et Loir.

Its form is that of an irregular oval; its greatest length is from west-north-west to east-south-east, from between Orléans and Châteaudun (Eure et Loir), to the neighbourhood of Bonny on the Loire, 73 miles; its greatest breadth, at right angles to the length, is from the neighbourhood Malesherbes to that of La Ferté-Senneterre, 51 miles. Its area is estimated at 2585 square miles, which is above t average of the French departments, and is exactly equal that of the English county of Devon. The population 1831 was 305,276; in 1836 it was 316,189; showing an increase in five years of 10,913, or above three and a half per cent., and giving 122 inhabitants to a square mile. The department is below the average of France both in amount and density of population, and very far below the English county with which we have compared it. Orléans, the capital, is in 47° 54′ N. lat. and 1° 54′ E. long., 67 miles south by west of Paris in a direct line, or 71½ miles by road through Etampes.

The hills that branch off from the prolongation of the Cévennes in the neighbourhood of Autun, and extend north-westward, separating the basin of the Loire from that of the Seine, enter this department on the south-east side, and extend for some distance along the northern bank of the Loire, subsiding near the source of the Vernisson, a feeder of the Seine, which rises within three or four miles of the banks of the Loire. The hills of the forest of Orléans, part of the heights of Beauce, a range of high land branching from the Armorican mountains, enter this department on the north-west side, and advance to meet the range of hills just described. They are separated only by the intervening valley of the Vernisson. Some maps represent the two as forming one continuous range. With the exception of these low hills the surface is tolerably level.

The greater part of the department is occupied by the supracretaceous rocks belonging to the chalk-basin of Paris. These occupy the valley of the Loire for a short distance on each side of the river; and extend over all the country northward of the Loire and westward of the Loing. The districts east of the Loing and south of the Loire are occupied by the chalk which surrounds the Paris basin, except for a short distance from the banks of the Loire on each side of the river where the chalk is covered by supracretaceous rocks. The only minerals are building-stone and potters' clay.

The principal river is the Loire, which is navigable throughout. It enters the department at Bonny, and flows north-west by Briare, Gien, and Jargeau to Orléans, gradually bending to the west, so that at Orléans its course is nearly from east to west. From that city it gradually bends to the south-west, and passing Meung and Beaugency, enters the department of Loir et Cher. Its length in this department may be estimated at about 80 miles. Several small streams join the Loire on each side. The Loiret, though it gives name to the department, is scarcely more than six or seven miles long. Its springs however supply such an abundance of water as to render it navigable for two miles and a half. It is never entirely frozen over.

The other rivers belong to the system of the Seine, in the basin of which the northern part of the department is included. The Loing, a tributary of the Seine, rises in the department of Yonne, enters this department on the east side, and flows northward by Montargis into the department of Seine et Marne; of its whole course, which may be estimated at more than 70 miles, nearly 30 miles are in the department. The Aveyron and the Ouanne, tributaries of the Loing, have their source in the department of Yonne, but join the Loing in this department, to which about miles of the course of the Ouanne, the larger of the two, belong.

The canal of Orléans begins in the Loire, a little above that city, and runs north-east to the valley of the Mou a feeder of the Loing, along which it proceeds until it joins the canal of the Loing near Montargis. The length of this canal may be estimated at 45 miles. The canal of Briare commences in the Loire at Briare, and runs northward, but by a circuitous course along the valley of the Loing, first on the right, then on the left bank of the river, to Montargis: its length may be estimated at nearly 35 miles. It crosses a projecting portion of the department of Yonne; otherwise it belongs entirely to that of Loiret. The canal of the Loing commences at Montargis, where it communicates with the two above-mentioned canals, and follows the valley of the Loing, first on the left bank, then along the bed, then along the right bank, a again along the bed of the river till its junction with the Loire at Moret. Of its whole length, which may be estimated at about 27 miles, about 11 or 12 belong to this department. Of the lateral canal of the Loire, formed from Digoin to Briare, to avoid the natural difficulties of the navigation of the river, about 11 miles are in this department.

There are in the department nine Routes Royales, or government roads, having an aggregate length of 309 miles, viz. 159 in repair, 62 out of repair, and 48 unfinished (1 Jan. 1837). A road runs from Paris to Orléans: it enters the department at Artenay, and runs direct to Orléans. From Orléans two roads run, one along the north bank of the Loire, by Meung and Beaugency, to Blois (Loir et Cher), and Tours (Indre et Loire); the other, crossing the Loire by the bridge at Orléans, runs south to Châteauroux and Limoges. Another road from Orléans follows the north bank of the Loire to Gien and Briare, where it falls in with the high road from Paris to Nevers (Nièvre) and Moulins (Allier). Other roads run from Orléans, by Montargis, to Courtenay in the north-east part of the department, and to Châteaudun in the department of Eure et Loir. The main road from Paris to Nevers and Moulins, and from thence to Lyon on one hand and Clermont on the other, enters the department on the north side, near Ferrières, and runs south by Montargis to Briare, where it unites with the road from Orléans to Nevers. The Routes Départementales (departmental roads), fourteen in number, have an aggregate length of more than 250 miles, of which about two-thirds are in repair, the rest out of repair or unfinished. The bye-roads and paths exceed 3000 in number, and have an aggregate length of above 2,000 miles.

About one-sixth of the soil consists of rich loam, and about as much of gravelly or stony land, or of uncultivated heath or other waste; the remaining two-thirds consist almost entirely of a light sandy soil. The produce of grain, especially rye, is very considerable, and far exceeds the consumption of the department. Almost two-thirds of the land are arable. A considerable quantity of pulse, fruit, saffron, flax, hemp, and colza, are raised. The banks of the Loire, between Briare and Orléans, constitute one of the most sterile portions of the department. The hills of Beauce, which rise in the northward of this barren tract, are covered with vineyards: the red wines which they produce are of excellent quality; the white wines are very poor. The quantity of horned cattle is considerable; sheep of English breeds and merinos have been naturalised with success. The quantity of meadow-land is about 60,000 acres; the extent of the commons and other open pastures is about 140,000 acres. A great quantity of poultry, especially turkeys, is bred for the supply of Paris. Bees are numerous in the hills of Beauce, and the honey is considered excellent. The rivers, with the numerous ranges of pools, supply the neighbouring departments with fresh-water fish. The quantity of woodland is considerable, amounting to nearly one-sixth of the whole department. The principal forests are those of Orléans in the centre, and of Montargis in the eastern part of the department.

The department is divided into four arrondissements, as follows:—

	Situat.	Area in Sq. Miles	Population. 1831.	1836.	Communes.
Orléans	W.	929	137,820	141,037	106
Pithiviers	N.	459	60,030	60,878	98
Gien	S.	570	41,273	43,640	49
Montargis	E.	627	66,144	70,291	95
		2585	305,276	316,189	348

The number of cantons, or districts under a justice of the peace, is 31.

In the arrondissement of Orléans are Orléans (pop. in 1831, 40,161; in 1836, 40,272) [Orleans]; Châteauneuf (pop. 2964 town, 3160 whole commune); Meung (pop. 4246 town, 4636 whole commune); and Beaugency (pop. 4482 town, 4882 whole commune), all on the north bank of the Loire; Jargeau, Mosnis, and Notre Dame de Cléry, on or near the south bank; Olivet on the Loiret; Patay near the Conie, a feeder of the Loir; Neuville near the source of the Œuf or Essone, a feeder of the Seine; and Artenay, on the road from Paris to Orléans. Châteauneuf has some manufactures of coarse woollens and linens. Meun, or Meung, has an antient palace, formerly belonging to the bishops of Orléans. The inhabitants of the town are engaged in tanning and paper-making, in the cultivation of the vine, and in fishing. There are many corn-mills. It was the native place of Jean de Meun, a poet of the middle ages, of some repute at the court of Philippe le Bel. The town was several times taken in the wars with the English, and in the civil dissensions of the sixteenth century. Beaugency has a bridge of thirty-nine arches over the Loire. The townsmen manufacture serges, hats, and leather. There are several distilleries. The wines of the neighbourhood, as well as of Meun, are excellent, and furnish a considerable article of trade. Jargeau was taken by the English in the war under Henry V. and VI., and retaken in the year 1429. Notre Dame de Cléry has a church, formerly collegiate, with a lofty spire, which at a distance forms a striking object. Louis XI. rebuilt this church, which had been destroyed by the English, and directed that his body should be buried there instead of at St. Denis. His request was complied with; and his tomb, which had been removed during the Revolution to Paris, was replaced in its former situation after the restoration of the Bourbons. It was at one time much resorted to, from the fame of the miracles which the Virgin was supposed to work there. At Olivet the great Duke of Guise was assassinated by Poltrot, as he was preparing to form the siege of Orléans. Patay was the scene of the first pitched battle won by the French over the English, after the appearance of Jeanne d'Arc had turned the tide of success.

In the arrondissement of Pithiviers are Pithiviers (pop. in 1831, 3862 town, or 3957 whole commune; in 1836, 4023 commune) and Malesherbes, on the Œuf, or Essone; Puiseaux (pop. 1876 town, 1970 whole commune), between the Essone and Suzain, a feeder of the Loing; Beaune and Boiscommun on the branches of the Suzain; and Achère, or Achères le Marché. Pithiviers is well known for its almond-cakes and its lark-pies, of which a considerable number are sent to Paris. Considerable trade is also carried on in cattle, wine, vinegar, honey, and saffron. The town has three yearly fairs. The saffron grown round Pithiviers is considered the best in Europe. Building-stone, which takes a polish almost equal to marble, is quarried in the neighbourhood. Malesherbes was the lordship of one of the ministers and the defender of Louis XVI. on his trial before the Convention. Puiseaux was nearly destroyed by a flood in A.D. 1609; 150 houses were overthrown, and 100 lives lost, besides much cattle.

In the arrondissement of Gien are Gien (pop. in 1831, 4631 town, 5177 whole commune; in 1836, 5230 commune), Briare (pop. 2243 town, 2739 whole commune), and Bonny, all on the north bank of the Loire; and Beaulieu, Châtillon sur Loire, St. Gondon, and Sully, on the south bank. Gien has a handsome bridge over the Loire. The chief, if not the only manufacture, appears to be that of superior earthenware: there is also some trade in wool and leather. Briare consists of one main street, straight and tolerably well built; and is chiefly inhabited by the boatmen who work on the Loire, or on the Canal de Briare, which here opens into that river. A considerable trade, especially in wine, is carried on, which is promoted by the situation of the town at the junction of the Canal de Briare with the Loire. Bonny, or Bony, is a tolerably good looking town, about the same size as Briare. Sully has a handsome château and a church formerly collegiate. It gave the title of duke to Maximilian de Bethune, minister of Henri IV. The population of the commune at the commencement of the present century was 2500.

In the arrondissement of Montargis are Montargis (pop. in 1831, 6761; in 1836, 7757), Châtillon sur Loing (pop. 1721 town, 2126 whole commune), and Ferrières, all on or near the Loing; Courtenay on the Clery, a feeder of the Loing; Château Renard, on the Ouanne; and Lorris, on the Canneau, one of the affluents of the Moulon, which flows into the Loing. The origin of Montargis is not known, but the remains which have been discovered show it to have been a place of some note in the time of the Romans. There are some bridges over the Loing. Towers called 'the towers of Chenevières;' the remains of a circus near them; and a military way, still called 'Cæsar's road,' which are of Roman origin: and in 1725 the remains of a portico with a mosaic pavement were discovered. The town is small, but pleasantly situated in the midst of meadows: it is walled, and had an antient castle built by Charles V., in which, on account of the purity of the air, the queens of France were accustomed to lie in. In this castle was formerly shown the portrait of a celebrated dog, who, according to tradition, pointed out the grave and overcame in a legal combat the assassin of Aubry de Mondidier, his master. The incident was dramatized and performed with considerable success at the minor theatres of London some years since, under the title of 'The Dog of Montargis, or the Forest of Bondy.' The castle was pulled down about A.D. 1810. The streets of Montargis are broad and straight, but the houses are ill built. The only parish church, that of La Madeleine, in the middle of the town, is much admired for its architecture. There are two large paper-mills forming one establishment about a mile from the town: in the same establishment woollen rags are reduced to the state of wool for the purpose of being again spun and woven. The trade of Montargis is promoted by the canals of the Loing, of Orléans, and of Briare, which unite near the town; the chief articles of trade are cattle, corn, wine, wood, and wool. The exhalations from these canals have caused a deterioration in the air of the place, once so famous for its purity and healthfulness. Montargis has a handsome theatre, one or two subordinate courts of justice, and an agricultural society. This town was besieged by the English, A.D. 1427, but the siege was raised, and the besieging force entirely defeated by Dunois, bastard of Orléans. It was however taken by the English in A.D. 1431, and retained by them till A.D. 1438. Montargis was the birth-place of the quietist Madame La Motte Guyon, whose poems were translated by Cowper, and of Manuel, procureur or attorney of the commune of Paris in the French revolution. Châtillon sur Loing was the birthplace of Admiral Coligny. Château Renard was one of the strongholds of the Huguenots in the religious wars of the sixteenth century: its fortifications were on that account demolished by Louis XIII. Lorris was formerly distinguished by a recognised custom of deciding all questions of disputed debts, in the absence of documentary evidence, by single combat between the debtor and creditor; if gentlemen, with swords; if of inferior rank, with fists.

Near the village of Nogent sur Vernisson are some remains of a Roman town or post, the name of which is unknown. The principal relic is a theatre, in the enclosure of a château, called Chenevier. The benches or seats are formed of small cubical stones, similar to those employed in several Roman edifices. Several medals, a bronze Mercury, and other antiquities have been discovered; and in the neighbourhood of the theatre, in a thicket, are some remains supposed to be those of baths. These antiquities have been but little noticed by the French antiquaries.

The manufactures of the department are considerable. The wool of Beauce and Sologne is made up into various fabrics: parchment and hosiery are manufactured; and sugar refining, vinegar-making, and the distillation of brandy are carried on to a considerable extent. Trade is carried on in the agricultural produce, grain, wine, and timber; in brandy, earthenware, and moulds for the sugar-refiners.

The department constitutes the diocese of Orléans, the bishop of which is a suffragan of the archbishop of Paris. It is in the jurisdiction of the Cour Royale and in the circuit of the Académie Universitaire of Orléans: and in the first military division, the head-quarters of which are at Paris. It returns five members to the Chamber of Deputies.

In respect of education this department is rather above the average of France· the number of young men in the military census of 1828-29 who could read and write was forty-two in every hundred; the average of France being rather more than thirty-nine.

This department formerly constituted part of the territory of the Carnutes, one of the Gallic nations of Celtic stock. In the Roman division of Gaul it was comprehended in Lugdunensis Quarta. Genabum, or Cenabum, the modern Orléans, was one of the chief trading stations of the Carnutes. This town took at a subsequent period the name of Aureliani, probably from the emperor Aurelian. A town is mentioned in the Itinerary of Antoninus by the name of Belca, which is probably the present village of Bouzi, on the left of the road from Orléans to Gien. A part of the territory of the Senones, another Celtic people, is included in the department: Brivodurum, the modern Briare, was one of their towns. In the decline of the Roman Empire, this department was ravaged by the Huns; and afterwards divided between the Franks and the Visigoths, whose territories were separated by the Loire. It subsequently came altogether into the hands of the Franks, and in the division of their territories among the sons of Clovis, formed part of the kingdom of Orléans. It was included in the great Duchy of France united to the crown by Hugues Capet. [ORLEANS.] It comprehends Orléanais proper, with part of Gâtinois and Dunois, subdivisions of the province of Orléanais; also a part of the former province of Berri.

LOKMÂN is represented in the Koran and by later Arabian tradition as a celebrated philosopher, contemporary with David and Solomon, with whom he is said to have frequently conversed. He was, we are told, an Arabian of the antient tribe of Ad, or, according to another account, the king or chief of that tribe, and when his tribe perished by the Seil-ol-Arim [ARABIA, vol. ii., p. 215] he was preserved on account of his wisdom and piety. Other accounts, drawn mostly from Persian authorities, state that Lokmân was an Abyssinian slave, and as noted for his personal deformity and ugliness, as for his wit and a peculiar talent for composing moral fictions and short apologues. He was considered to be the author of the well known collection of fables in Arabic, which still exist under his name. There is some reason to suppose that Lokmân and Æsop were the same individual. This supposition is founded on the close correspondence of the traditional accounts of the person, character, and life of Lokmân, with those of Maximus Planudes respecting Æsop. [ÆSOPUS, vol. i., p. 155.] Even the name of Lokmân may, by a slight transposition, be derived from the Greek Alkman. If Lokmân is not altogether a fictitious person, his history seems to have been mixed up with that of Æsop. The monk of Constantinople probably engrafted many incidents of his life on the few circumstances recorded by the classic writers respecting that of the Greek fabulist. He may have been induced to do it by the apparently Asiatic origin of Æsop and the derivation of his name (from αἴθω and ὤψ, which to a Greek would seem a forced derivation), and this assumed Asiatic origin might afterwards give rise to his dull buffooneries, his bodily defects, and Æthiopic extraction.

The fables of Æsop have by no means the character of antient and original Greek compositions. Many of them are strongly marked with an Oriental character. They bear a very striking resemblance to the Indian fables in the 'Panchatantra;' they allude to Asiatic manners and customs; and animals are mentioned in them, which are only found in Upper Asia, as monkeys, peacocks, &c. In the fables of Lokmân the same peculiar features frequently occur. Hence we may safely infer that both collections were originally derived from one common source, the Indo-Persian entertainment of this description: from this source certainly came the fabulous work attributed to Syntipas (who was no other than the Sindbad of the 'Arabian Nights') and other works of that kind, which during the middle ages so powerfully attracted the attention of Europe.

(See Boissonnade, *Præf. ad Syntipam*, p. vi.; Grauert, *De Æsopo et Fabulis Æsopicis*, Bonnæ, 1825.)

The fables of Lokmân show, in many instances, evident marks of a later and traditional origin; the moral or application is frequently misunderstood, or at least ill adapted to the apologue; a few antient expressions had then become obsolete and are interpreted by words of more modern origin; and the language in general exhibits some slight deviations from grammatical accuracy, and approaches nearer to the modern Arabic idiom; as for instance, in the use of the oblique case instead of the first case. The style is easy and flowing. The fables have often been reprinted for the use of those who are beginning to study the language, after the first edition with a Latin interpretation, by Erpenius, Lugd. Batav., 1615, the best and latest editions are by Cousin, Paris, 1818; Freytag, Bonnæ, 1823; and Roediger, Halis, [illegible]

LOLI'GO. [SEPIADÆ; TEUTHIDÆ.]

LOLIGOPSIS. [SEPIADÆ; TEUTHIDÆ.]

LO'LIUM, a genus of Grasses, containing a few species common in many parts of the northern hemisphere, is defined as follows:—Spikelets many-flowered, distichous, contrary to the rachis, sessile. Flowers not bearded at the base. Glumes 2, nearly equal, one of them very often deficient in the lateral spikelets, herbaceous, awnless. Paleæ 2, herbaceous; the lower concave and awnless, or awned under the apex; the upper with two keels. Stamens Ovary smooth. Styles 2, very short. Stigmas feathery. Hypogynous scales 2, fleshy, entire or two-lobed. Rachis not jointed. There are two species which require notice: 1, *L. perenne*, the common Ray-grass, or Rye-grass of the former, with lanceolate awnless spikelets which are longer than the glume, a naked stem, and a perennial root. [illegible] this, which is one of the most valuable of our pasture grasses, an account is given elsewhere. [RYE-GRASS.] 2, *L. temulentum*, or darnel, with elliptical awned spikelets, straight awns longer than the paleæ, glumes the length of the spikelet, and an annual root. Of this species mention is made not only in all parts of Europe, but in Japan, New Holland, China, and Monte Video; it is remarkable as being the only well authenticated instance of a plant belonging to the order of Grasses, in which narcotic or even deleterious properties have been found. The grains are said to produce intoxication in man, beasts, and birds, and to bring on fatal convulsions. According to Christison, darnel, when mixed with flour and made into bread, has been known to produce headache, giddiness, somnolency, delirium, convulsions, paralysis, and even death. A few years ago, the same author tells us, almost the whole of the inmates of the Sheffield workhouse were attacked with symptoms supposed to be produced by their oatmeal having been accidentally adulterated with Lolium; and a case is on record of a small farmer near Poitiers in France having killed himself by persevering in the use of darnel flour for making bread; his wife and servant, who discontinued to eat it, escaped, but were violently affected with vomiting and purging.

LOLLARDS, a religious sect which arose in Germany at the beginning of the fourteenth century, and differed in many points of doctrine from the church of Rome, more especially as regarded the mass, extreme unction, and atonement for sin. It took its name, according to some writers, from Walter Lollard or Lolhard, who was burnt alive for these doctrines at Cologne in 1322; but it would seem that Walter rather received his name from the sect, than gave a name to it. The real origin of the term appears to be the German *lullen*, *lollen*, or *lallen*, to sing, with the well-known termination of *hard* which is subjoined to so many German words; and it implied a person who was continually praising God in sacred songs. Lollard subsequently became a term of reproach for all heretics, who were supposed to conceal erroneous doctrines under the appearance of piety; and, in England, at the close of the fourteenth century, it was given to the followers of Wicliffe. Knighton, noticing the success of that reformer's doctrines (*Twysd. Script.* x. col. 2664) says, 'more than half of the people of England in a few years became Lollards.'

Mosheim, in his 'Ecclesiastical History' (b. iii., part ii., ch. 2), observes, 'Charles, duke of Burgundy, obtained a decree from Sixtus IV., in the year 1472, by which the Cellitæ or Lollhards were admitted among the religious orders, and were withdrawn even from the jurisdiction of the bishops; and Julius II., in the year 1506, conferred on them still greater privileges. Many societies (he adds) of their kind still exist at Cologne and in the cities of the Netherlands, though they have essentially departed from their antient manner of life.' This, of course, was previous to the French Revolution. (Furetiere, *Dictionnaire Universel*; Mosheim, *Institutes of Ecclesiastical History*, by Murdock, 8vo., Lond., 1832, vol. ii., p. 454-456.)

LOMATO'CERAS. M. Bronn has given this name to a generic group embracing certain of the Linnæan Graptolithi [GRAPTOLITHUS] instead of Priodon, which had been assigned to them by Nilson, but previously employed by Cuvier for a genus of fishes. Graptolithus scalaris and G. sagittarius, Linn., belong to this group, which as far as yet known is confined to the 'transition strata,' in which it occurs in Norway, Bohemia, France, North Germany, Shropshire, &c., generally accompanying trilobites. (Bronn, *Lethæa Geognostica*.)

LOMBARD, an antient name in England for a banker. It was derived from the Langobardi, or Lombards, a company of Italian merchants, the great money-changers and usurers of the thirteenth century, who appear to have settled in England before the year 1274, and took up their first residence in a street of the city, still called, from them, Lombard Street.

Stowe, in his 'Survey of London,' 4to., 1603, p. 202, says, 'Then have ye Lombard Streete, so called of the Longobards and other merchants, strangers of diverse nations, assembling there twise every day. The meeting of which merchants and others there continued until the 22nd of December in the year 1568, on the which day the said merchants began to make their meetings at the Bursse, a place then new builded for that purpose in the warde of Cornhill, and was since by her majestie Queen Elizabeth named the Royal Exchange.'

The extortions of the Lombard merchants in King Edward III.'s time became so great that he is stated to have seized upon their estates. They continued however to follow their trade; and when Henry VI. borrowed money of them, they had the customs mortgaged to them for security.

(Du Cange, *Gloss.* v. 'Langobardi;' Pennant's *Hist. of Lond.*. edit. 1790, p. 407; Nares's *Glossary*.)

LOMBARDIC ARCHITECTURE. This style, which has already been touched upon in the article GOTHIC ARCHITECTURE (vol. xi., p. 320), may claim to be considered the generic one which prevailed after the extinction of the Roman until the appearance of the Pointed or Gothic. It is the intermediate link between them, but so united with them that it is difficult to fix with precision where it begins or where it terminates. Yet although the same elements, variously modified indeed, may be traced in our Saxon or Early Norman and Norman styles, and also in the contemporary styles of other countries, the term is usually restricted to the Italian architecture of the period alluded to, which, if it has something in common with those collateral styles, namely, what they borrowed from it, possesses also much that is sufficiently distinct, and that marks it as a separate class. In the degenerate Roman architecture the rudiments of a new style were beginning to develop themselves, owing to the almost general application of the arch, both as a constructive and ornamental feature, and also to the subordinate rank assigned to columns, which, besides being engaged, or partly inserted into the wall, were greatly diminished in size, that is, although they retained the same proportions as before, they were upon a comparatively diminutive scale in proportion to the edifice itself, each story being, as in the Colosseum, decorated with its own order. Consequently, though nominally no change had been made, in reality a great revolution in art had been effected.

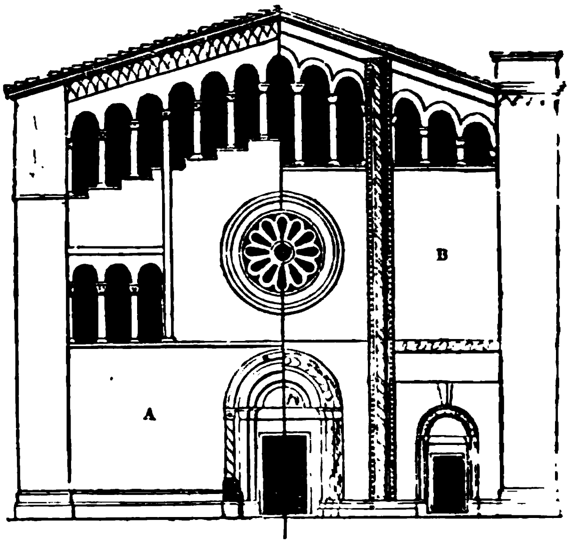
Notwithstanding therefore that we are accustomed to regard the Lombardic historically as altogether another style, it does not present much greater discrepancy of character from that which it supplanted than the latter does from the earlier Greco-Roman. In fact it was only a further development of the system introduced during the decline of Roman architecture, and so far more consistent and homogeneous than the other, which exhibited the attempt to reconcile discordant features and conflicting principles, namely, small orders applied merely as decoration, and tiers of arches whose piers form the solid parts and supports of the structure. Whether it was the result of chance, caprice, or necessity, or of all three, the Lombardic style reconciled these two contradictory modes by combining together the arch and the column, and rendering the latter the essential support of the former. It is true, arches resting upon insulated columns occur in buildings of the *Decadence* period, for instance, in what are now the churches of Sta. Costanza and Santo Stefano Rotondo, at Rome; but in such cases, instead of springing immediately from the capitals of the columns, the arches rest upon a piece of entablature forming a square block above the capital (which practice has been copied in the interior of St. Martin's church, London). The discarding all appearance of entablature was undoubtedly an improvement, since such detached fragments of it served only to render the impropriety—supposing there to be any—of placing arches upon columns all the more glaring, because indicating what ought to be a continuous horizontal member. At first the columns themselves were mostly tapering, not cylindrical as the slender detached ones met with in the Pointed style, and the capitals bore a more or less close resemblance to those of the Corinthian order in contour and proportion. The capital itself however was larger in proportion to the rest of the column, thereby affording a greater surface or impost for the arches to rest upon; and also combining the appearance of security at that point with general lightness of appearance. The shaft was mostly plain, yet frequently highly ornamental, striated or carved in different ways, and sometimes twisted, either singly or with two stems twining spirally around each other. Columns furnishing examples of all these different modes occur in the cloisters of San Paolo and San Giovanni Laterano at Rome, and the capitals present quite as much variety, it seeming to have been the aim on such occasions to introduce as much diversity as possible, instead of so arranging the columns as to have two of the same kind placed together; a practice probably originating in making use of columns and fragments taken from other buildings; and afterwards retained as conducing to variety and richness.

Although the arches were, as frequently as not, quite plain, and without archivolt mouldings of any kind, the use of archivolts was by no means uncommon; sometimes consisting of merely a single moulding enclosing a plain border around the arch, at others divided into *faciæ*, and more or less enriched, as in the front of the cathedral of Pisa, in which building the arches describe more than a semicircle above the capitals of the columns, being prolonged downwards by a deep abacus, consisting in some places of two, in others of a single plain block resting immediately on the capital; a mode certainly preferable to that of placing a mere lump of entablature upon the column, and not ungraceful in itself, because it gives greater height and importance to the arches, which, being narrow, would else appear stumpy, depressed, and overloaded by the ornament around them. Similar blocks or *abaci* occur in the remains of Frederick Barbarossa's palace at Gelnhausen, where small heads or masks are introduced immediately above such abaci, so as to fill up the space there between the arches, and continue in some degree the vertical lines produced by the columns.

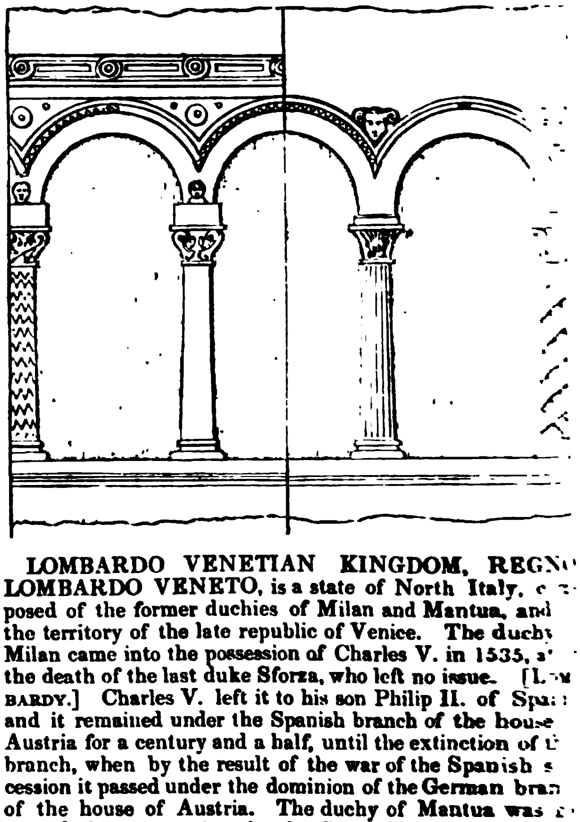
Among the other more prominent characteristics of this style, which are all that we can here touch upon, it should be noticed, that whether forming actual porticos and galleries, or closed up and applied merely as decoration, these arcades were generally small in proportion to the building itself, and instead of occupying the entire width of the front, or other elevation, were mostly inserted into distinct compartments of it, slightly recessed within the general face of the wall, so that the plain spaces between them assumed the appearance of buttresses, or, when narrow, of plain pilasters continued up to the cornice of the gable or roof, and cutting through whatever string-courses, or other horizontal mouldings (if there were any), divided the different stories or stages of the edifice. Such buttress-like surfaces—for buttresses they cannot properly be termed—were occcasionally more or less enriched; sometimes so much so, as to produce vertical lines of ornament continued the entire height of the building, as in the front of San Michele at Pavia—which city may be considered as the cradle of Lombardic architecture. When, as was frequently done, these surfaces were made wider at the angles of the front than elsewhere, they gave an expression of repose and of great solidity to it, serving as it were as a frame to the architectural decoration.

Among the other peculiarities of this style, that arising from small open galleries immediately beneath the cornice or roof is too remarkable to be overlooked, especially in gable fronts, where the arches of such galleries follow the slope of the roof itself, the columns being successively elevated one above another on steps (so that the base of those supporting the centre arch are above the lower arches), as at San Michele, just mentioned; or else by placing the columns on the same horizontal line, and gradually increasing their height, as in the front of Pisa cathedral. To this may be added the very prevalent custom of making an upper cornice or border of very small interlacing arches, or rather of mouldings producing that appearance. Pinnacles are of rare occurrence, and when introduced have the look of being set on the part they rise above, being separated from it by horizontal mouldings; besides which they are generally low, and somewhat resemble pedestals. Pinnacles of this description may be found surmounting pilaster-breaks, and cutting through either an horizontal cornice or the sloping ones of a gable, as in the front of the cathedral at Monza.

To render the above slight account of this mediæval Italian style more intelligible, some of its elements and leading forms are here indicated in a sketch exhibiting two different compositions of a façade; the half front marked A showing the columns of the arcade in the gable all of the same height, but placed on different levels; while that marked B represents them standing on the same horizontal line, and consequently unequal in height. The side B also shows a variation in regard to the form of the gable, which, instead of extending the whole width of the front, takes a horizontal direction over the pier at the angle. An enriched pilaster face is also introduced in this division of the cut, and, although rather peculiarly applied, is warranted by the authority of San Michele at Pavia. A very imperfect idea however is thus conveyed of the variety of features, combinations and proportions which the style itself admits.



The other cut gives an example of an arcade on a larg scale, with columns variously ornamented, and having th capitals surmounted by blocks, which give greater elevat to the arches themselves. This however is only one pa cular mode; besides which both the columns and arches b shown are uniform in their proportions, and consequ must not be considered as attempting to afford a defi standard of a style which permits such very great latit in regard to features of that sort.



LOMBARDO VENETIAN KINGDOM, REGN LOMBARDO VENETO, is a state of North Italy, c posed of the former duchies of Milan and Mantua, and the territory of the late republic of Venice. The duchy Milan came into the possession of Charles V. in 1535, a the death of the last duke Sforza, who left no issue. [L BARDY.] Charles V. left it to his son Philip II. of Spa and it remained under the Spanish branch of the house Austria for a century and a half, until the extinction of t branch, when by the result of the war of the Spanish s cession it passed under the dominion of the German bra of the house of Austria. The duchy of Mantua was verned for a long time by the Gonzaga as a fief of empire, but the last duke, Ferdinand, having sided with French during the war of the Spanish succession, the peror Joseph I. put him under the ban of the empire, a the Austrian troops having taken Mantua, the emperor a nexed it to the duchy of Milan. Austria continued govern these united states till Bonaparte's invasion of 1 By the peace of Campoformio of the following year Aus gave up Milan and Mantua, and received as a compensa for them and Belgium, which was also taken from her the French, the territory of the republic of Venice, wh

Bonaparte had overthrown. Milan and Mantua, or Lombardy Proper, were constituted first as a republic dependent on France, and afterwards into a kingdom, of which Napoleon made himself king in 1805. At the close of that year, in consequence of the campaign of Austerlitz, Napoleon retook from Austria the Venetian territories, which he annexed to Lombardy, styling the whole by the name of the kingdom of Italy, though this new kingdom did not comprise above one-third of Italy. He added to it the state of Modena, the Legations, and lastly in 1808 the Papal Marches. The whole population of this kingdom was about six millions. In 1814 the Austrian and allied forces occupied the kingdom of Italy, and the emperor Francis again took possession of his former territories of Milan and Mantua, and also of Venice, the latter as a compensation for his loss of Belgium; and this measure was confirmed by the congress of Vienna. The districts south of the Po were restored to their former sovereigns; Modena to its duke, and the Legations and Marches to the Pope. The emperor Francis then constituted the territory of Milan, Mantua, and Venice into a kingdom, styled Lombardo-Veneto, which was annexed to the imperial crown of Austria.

The northern boundaries of the Lombardo-Venetian kingdom, proceeding from east to west, are the Alps of Friuli, and the Carnic Alps, which separate it from Carinthia and Carniola, and several offsets of the Rhætian Alps, which divide it from the Tyrol; farther to the north-west it is bounded by the main chain of the Rhætian Alps, from the Ortler Spitz to Monte Jorio, which divide it from the Grisons. From Monte Jorio, an irregular boundary line, not very definitely marked by nature, divides the Lombard territory from that of the Canton Ticino, which forms part of Switzerland. This boundary-line between the two states terminates on the eastern coast of the Lago Maggiore, a few miles north of the influx of the river Tresa. From thence southward, the Lago Maggiore, and the river Ticino, which issues from it, mark the western boundary of the Lombardo-Venetian kingdom, and divide it from the Sardinian territories. The course of the Po marks its southern boundary, and separates it from Parma, Modena, and the Papal State, except in one part of the Modena frontier, where a slip of ground along the southern bank of the Po, which belonged to the old duchy of Mantua, continues to form part of the present Austrian Lombardy. In the delta formed by the Po, the branch of that river called Po d'Ariano, the mouth of which is named Porto di Goro, marks the limits between the Austrian and Papal territories. [FERRARA, LEGAZIONE DI.] The eastern boundary of the kingdom is formed by the Adriatic. Its limits to the north-east are fixed at the mouth of the river Ausa, west of the Isonzo. [FRIULI.]

The Lombardo-Venetian kingdom is governed by a Viceroy, who is generally an arch-duke of the Imperial Austrian family, and resides at Milan: it consists of two great administrative divisions: 1, Provincie Lombarde, or government of Milan; and 2, Provincie Venete, or government of Venice. These divisions acknowledge for their respective political heads the governors of Milan and Venice. Each division is subdivided into provinces called Delegazioni, at the head of which is a delegate; each province is divided into districts, and at the head of each district is a commissary. The districts are subdivided into communes, and each commune has a podestà for its local magistrate. The provinces are described under the following heads: Lombard provinces—BERGAMO; BRESCIA; COMO; CREMONA; LODI E CREMA; MANTOVA; MILANO; PAVIA; SONDRIO, or VALTELLINA. The Venetian provinces are likewise described under BELLUNO; PADOVA; ROVIGO; TREVISO; VENEZIA; VERONA; VICENZA; UDINE, or FRIULI.

The whole population of the kingdom consisted in 1832 of 4,279,000 persons, namely, 2,379,000 in the Lombard provinces, and 1,900,000 in the Venetian. (Serristori, *Saggio Statistico dell' Italia*, Vienna, 1833.) In 1837 the population of the Lombard provinces had increased to 2,460,079. (*Bollettino di Notizie Statistiche*, published by Lampato, Milano, Maggio, 1838.) We have not seen any corresponding statement concerning the Venetian provinces later than 1833.

The governor of each of the two great divisions of Milan and Venice is advised and assisted by a central congregation or provincial assembly, consisting of landholders and deputies from the royal towns, of which there are several in each province. Every province returns two landholders, one noble and the other not noble, as deputies, and every royal town returns one deputy. The respective communal or municipal councils select three persons, out of whom the emperor, as king of Lombardy, chooses one as a deputy. The deputies are elected for six years. These congregations are not legislative assemblies, but boards of administration; they settle the proportion of the taxes, both general and local; they inspect the accounts of repairs of roads, bridges, &c., and have also the superintendence of the charitable establishments of the country and their revenues. They can petition the sovereign concerning the wants and wishes of the people. Their resolutions are by a majority of votes. In every head town of a province there is a provincial congregation consisting of eight, six, or four landowners, one-half nobles, and the other half not noble, who concern themselves especially with the administration of the municipal and communal finances of their respective districts. The communes have their own councils, and a complete system of communal administration has been established. (*Collection de Constitutions, Chartes, et Loix fondamentales des Peuples de l'Europe et de l'Amérique*, par Dufay, Duvergier et Gaudet, vol. v.)

The administration of the Lombardo-Venetian kingdom since the Restoration has paid peculiar attention to the material improvements of roads, bridges, canals, dykes, and other public works, for which, in the course of fifteen years, from 1820 to 1834, the treasury has disbursed forty-two millions of livres for the Lombard provinces alone. This amount is independent of the sums expended by the communes for the communal or cross roads, which from 1814 to 1831 amounted to about twenty-four millions, for a length of 3294 miles of road. Thirty-five years since there were few communal roads in Lombardy deserving the name. Of the forty-two millions disbursed by the government treasury, five millions have been employed in constructing or repairing the dykes in the province of Mantua; about four millions in completing the great canal called Naviglio; a million and a half in making roads in the mountainous districts of Bergamo; about as much again for the great commercial road of the Splugen; two millions and a half for the road over the Stilfser Joch, and nearly three millions more for continuing it along the eastern bank of the lake of Como down to Lecco; 2,323,000 livres for completing the cathedral of Milan; another million for other improvements at Milan; 600,000 livres for the splendid bridge at Buffalora on the Ticino; 200,000 livres for a new asylum for the deaf and dumb; 270,000 livres for buildings accessory to the university of Pavia; 103,000 for a new college at Sondrio in the Valtellina; half a million for roads in the province of Pavia, &c. A recent French traveller observes that 'nowhere perhaps on the Continent is the administration of the roads and bridges more actively and usefully employed than in Lombardy. The whole of this part of Italy exhibits a solid material prosperity; it presents the fine side of the Austrian dominion. The roads are like the walks of a garden, and they are kept in repair with the greatest care. This government, economical and parsimonious in other respects, is great and magnificent in this. The excellent state of repair of the high roads of the Lombardo-Venetian kingdom is maintained at the annual expense of about 1,305,000 francs for 1518 Italian miles (60 to 1° of lat.) of length of road.' (Valéry, *Voyages en Italie*, b. 2, ch. xiv.)

The towns of Lombardy, Brescia, Bergamo, Como, and Milan above all, are being embellished, and are increasing in population. Venice is the only exception to this generally prosperous condition: but Venice had been silently decaying for a century before its fall; and Bonaparte, by subverting its national government, completed its ruin. The subsequent stagnation of maritime trade, during the long war that followed, aggravated her distress. When Venice came into possession of Austria in 1814, there were no less than 44,000 individuals, nearly one-half of the population, who required, if not permanent, at least occasional relief from charity. The hospices and other houses for the old, the infirm, &c., were in a state of decay, and from 1814 to 1821 nearly four millions and a half of livres were spent in restoring and supporting those institutions; and four millions more in the following ten years. By these means, about 6000 helpless individuals were relieved. The house of industry for the able-bodied poor had been neglected by the French administration, and the commune or municipality of

Venice was too poor to bear the extraordinary charges required in order to put that institution in a fit state to fulfil its object. The government took it in their own hands for some years, and spent 719,000 livres upon it, till the year 1821, when it was restored to the hands of the commune in a prosperous condition, being able to supply its expenditure by its own means and the produce of the labour of its inmates. Besides the classes thus relieved, there were still numerous families, many of whom had seen better days, but who had fallen into distress, and required at least occasional relief. For these a 'Commission of public beneficence' was established, consisting of the principal citizens, with the podestà and the patriarch at their head: the government began by contributing to its funds at the rate of 100,000 livres a year; it then received subscriptions, donations, and bequests, and now it has an income of about half a million of livres. It distributes relief, especially during winter and in seasons of dearth, to nearly 40,000 individuals annually. The payment of pensions to former public servants, and to several of the old patrician families (who lost their income by the fall of the republic), which had been interrupted under the French administration, was resumed by the Austrian government. Independent of these direct helps, the government undertook the repair of numerous palaces, churches, and other public buildings which were threatened with ruin, as well as of the canals and bridges, and especially of the great marble dyke called the Murazzi, upon which Venice depends for its safety from the waves of the Adriatic. Fifty-three millions of livres have been spent by the treasury for all these objects in the last twenty years. By making Venice the head town of one-half of the kingdom, and the seat of a government, and of numerous offices and boards of administration, considerable advantage has accrued to the town, inasmuch as salaries to the amount of nearly two millions of livres annually are expended in it. The archives of the Venetian republic, the richest collection perhaps of state documents existing, have been placed and arranged in the convent of the Frari, where they fill more than 200 apartments. The Ducal palace of St. Mark, with its splendid marble staircases and apartments adorned with paintings by Titian, Paul Veronese, Tintoretto, and other great masters, had been turned under the French administration into public offices and courts, to the great injury of its ornaments, paintings and sculptures. The Austrian administration has cleared and restored that monument of antient Venetian greatness, and leaving it unencumbered for the admiration of the public, has purchased the palace Corner and other buildings, at the cost of nearly half a million of livres, for the accommodation of the offices and officers of the administration. Another half million has been devoted to the establishment of the Patriarchal Seminary, and an equal sum for the Academy of the Fine Arts. The whole of Venice has been made a porto franco, by force of which regulation articles of foreign importation are consumed within the town without paying duty. All these cares and benefits have considerably alleviated the general distress which was observable in Venice for several years after the peace: travellers who did not search into the remote causes of it, attributed all to the fault of the Austrian government. The accounts of those tourists who visited Italy in the first years after the peace, when everything was still unhinged in conseqnence of the great political change, are now quite out of date. The commerce of Venice has revived; the arrivals in the port of Venice, which were [illegible] in 1832, amounted in 1837 to above 3000 vessels, of the aggregate burthen of 211,000 tons. Venice ranks now as the third port of Italy, next to Leghorn and Genoa. The maritime commerce of Austria has increased wonderfully since the peace. Twenty years ago it had not above [illegible] merchant vessels; it has now above 3000, about one half of which belong to Venice. (*Bollettino Statistico di Milano* for the years 1835-38; *Semplice Verità in risposta a le Accuse di Enrico Misley*, Paris, 1834.)

In the department of popular education the Austrian government has extended to the Lombardo-Venetian kingdom the same general and uniform system which it had already established in its German States, and which is one of the most complete in all Europe. The elementary schools were first opened in Lombardy in 1822, and ten years after there was hardly a commune without its school, but several of the more extensive and populous communes had two. The number of communes in the Lombard provinces is 2234, and the elementary schools for boys are 2348, and those for girls 1231. Out of the aggregate number of the schools there are 71 upper schools consisting of four classes; the rest consist of two or three classes. The course of instruction is:—First class, spelling, slate-writing, elementary religious instruction, the first two rules of arithmetic. Second class, reading, writing, the catechism, the four rules of arithmetic, and fractions. The course of the first and second classes lasts three years. Third class, calligraphy, Italian grammar, specimens of epistolary and narrative composition, the elements of Latin, explanation of the gospels for Sundays and other holidays, arithmetic, fractions and rule of three. Fourth class, geometry, the principles of architecture, mechanics, geography, drawing, natural history. A fifth class is established in the chief towns of provinces, in which are taught history, the principles of commerce, book-keeping, mathematics, chemistry, the history of the arts, and the German, French, and English languages. The course in the upper schools lasts from three to four years.

The female elementary schools are divided into three classes:—First class, spelling and writing, mental arithmetic, needlework, written arithmetic, and religious instruction, consisting of the little catechism. Second class, religious instruction, orthoepy, the elements of grammar, the four rules of arithmetic, writing and parsing, marking and embroidery. Third class, sacred history, explanation of the gospels, calligraphy, Italian grammar, epistolary composition, the knowledge of weights and measures, and of currency.

In these schools there is upon an average one teacher for every 40 pupils. Corporal punishment is strictly forbidden. The tuition is gratuitous, the schools being supported from the communal fund. The schoolmasters have from 250 to 400 livres of fixed annual salary. A register is kept in every commune, and verified by the rector of the parish, of all the children from 6 to 12 years of age, who are all expected to attend their regular course at the schools, unless they have a dispensation from the visiting inspector, on account of illness or other sufficient cause.

In 1833 there were in the province of Bergamo 906 boys out of every 1000 of the prescribed age who attended the elementary schools. In the province of Como there were 778 out of every 1000; in that of Brescia 747; in that of Sondrio or Valtellina 733; in that of Milan 687; in that of Pavia 647; in Lodi e Crema 646; in that of Cremona 632; in that of Mantua 513. The proportion of girls was as follows:—Bergamo 909 of every 1000; Brescia 619; Sondrio 427; Pavia 403; Lodi e Crema 382; Mantua 330; Milan 302; Cremona 210; Como 195.

Of the Venetian provinces we have not seen later reports than 1825, when the system had not had time to attain its full extent. There were then about 1400 schools, attended by 62,000 boys, being only one-fourth of the whole number of the prescribed age, and directed by 1553 teachers and assistants, and 29 female schools frequented by [illegible] girls. There were 405 communes still deficient in schools. The system however was extending, and has been in progress annually ever since. (Quadri, *Prospetto Statistico delle Provincie Venete*.)

The text-books used in these schools are: spelling-book for the lowest class, spelling-book and reading-book; the catechism; an historical compendium of the Old Testament; historical compendium of the New Testament; duties of subjects; elements of physics; elements of geometry; introduction to geography, in two parts; introduction to Italian grammar; guide to composition; religious instruction for the two elementary classes; methodical guide for teaching; little tales for instruction; principles of arithmetic in four parts, for each of the classes. These books are sold at a few centimes each, and about 192,000 copies of them are distributed annually among the pupils. (Sacchi, *Memoria Statistica sull' attuale Stato dell' Elementare Istruzione in Lombardia, in confronto degli altri Stati d'Italia*, Milano, 1834; *Bollettino Statistico di Milano, anno* 1835, *primo semestre*, pp. 81, and

In the upper elementary schools of the chief towns of provinces there are courses of methodical teaching for those who are intended for schoolmasters. About 500 pupils follow these courses annually.

There are also in the towns and villages of Lombardy 'scuole festive,' or Sunday and holiday schools, above [illegible] in number, for children above twelve years of age, or for those below that age, who cannot on account of their occupations attend the daily elementary schools. In some of these lessons are given in drawing applied to the arts. In Milan the Academy of the Fine Arts gives evening courses during the winter for those operatives who wish to learn ornamental, architectural, and plan drawing, machinery, engraving, &c. There are also for the wealthier classes about 20 college convitti, or public boarding-schools, and 60 private ones, besides 630 private daily schools. Infant-schools have also been established of late years in most towns of Lombardy. ('On the Institution of Infant Schools and Holiday Schools in Lombardy,' in No. xix. of the *Quarterly Journal of Education*, July, 1835.)

From the upper elementary schools boys who intend to pursue their studies pass into the gymnasia, of which there is one in almost every town, and about 50 in the whole kingdom, with about 300 professors, and attended by between 7000 and 8000 students. The gymnasial course lasts six years, four of which are employed in the study of Latin and Greek grammar and prosody, the geography and history of the Austrian empire, and Roman antiquities. The other two years are engrossed by rhetoric and poetry, study of the classics, algebra, general geography, and history, ancient and modern, and religious instruction. (Sacchi, *Quadro Statistico dell' Istruzione Ginnasiale in Lombardia*, in the *Bulletino Statistico di Milano*, March, 1835; and also an article on 'Italian Education,' in No. vi. of the *Quarterly Journal of Education*, April, 1832.) Besides the gymnasia, there are 18 private institutions for youths, 'case private d'educazione maschile,' approved of by the government, which exercises an inspection over them. There are two general directions, or boards, at Milan and Venice, for the superintendence of all the establishments for secondary or grammar education throughout the kingdom. For the instruction of young ladies there are 22 collegi femminili, mostly under the direction of the nuns of Santa Teresa, of Sales, of Santa Chiara, and other orders, which devote themselves to the education of youth, and which are the only convents existing in the Lombardo-Venetian kingdom. All other monastic institutions were suppressed long since under the French, and their property was sold.

The Lombardo-Venetian kingdom is not only better supplied with elementary instruction than any other Italian state, but it is the only one in which a universal system of popular education has been established. With regard to 'secondary' or gymnasial education this kingdom is also better provided than any other Italian state, the continental dominions of the king of Sardinia alone excepted. The method however of the gymnasial education has remained as it was of old, and is susceptible of improvement. It is considered by many persons that too much time is spent upon Latin, at least by the majority of the pupils, who are not intended for the bar and other learned professions. Above the gymnasia are the Lycea, of which there are 12 in the whole Lombardo-Venetian kingdom, namely, two at Milan, and one in each of the following towns: Bergamo, Brescia, Mantua, Cremona, Como, Lodi, Venice, Verona, Vicenza, and Udine. The Lycea are devoted to philosophical studies, and the course lasts two years.

Lastly, the two universities of the kingdom, Padua and Pavia, supply instruction in all professional branches or faculties. A detailed account of these universities is given in an article on the 'Statistics of Education in Italy,' in Nos. xv. and xvi. of the *Quarterly Journal of Education*, Oct. 1834.

The object of the Austrian government in this extensive system of education is clear and definite; it proposes to form a population of docile but not ignorant or indolent subjects; to make individuals in general contented with their respective stations in life, without precluding any one from using his honest exertions to make the best of that station; and also, if talents and opportunities should favour, to rise to a higher one without injury to others or disturbance to society. There is no exclusive caste in Lombardy; all are equal before the law, and any one may attain the highest offices of the state. 'The Austrian government,' says an intelligent French traveller, already quoted, 'is both military and pedagogical; sergeants and schoolmasters are its functionaries. The effects of this general education are already quite perceivable in Lombardy, and we may expect soon to see the fulfilment of a very fine sentiment of the emperor Francis. Being urged once by some Milanese noblemen to proclaim a distinct criminal statute for this kingdom, as the Austrian statute was considered too mild for the temper of the Italians, he refused, saying that the spread of education and civilization would render his code as fit for Lombardy as it was for the hereditary states. "When all the people shall be able to read," said he, "they will ask no longer."' (Valéry, *Voyages Historiques et Littéraires en Italie*, b. iii., ch. 12.)

The Austrian civil and criminal codes are in force in the Lombardo-Venetian kingdom. Of the merits of the Austrian civil code much has been written, and several modern jurists, Thibaut, Schmidt, and others, have considered it in several respects superior to the French or Napoleon code. The penal code is generally milder than the French; but the trials, or *débats*, as the French call them, are not public; the depositions of the witnesses are taken in writing, and communicated to the accused, who can demand to be confronted with the witnesses against him. A legal proof is required, besides the full moral conviction of the judge, in order to condemn a culprit. This legal proof is made out not solely, as it has been misstated, from the confession of the accused, but also from the deposition of the witnesses and from circumstantial evidence. Two assessors attend the judge throughout the whole proceedings, and affirm upon oath their legality and impartiality. Every species of torture has been abolished since the reign of Joseph II. The Austrian penal code has also abolished the penalty of confiscation, which the code Napoleon retained in certain cases—among others, against emigrants. By the Austrian law, the property of a state prisoner or political emigrant who will not surrender himself for trial is placed in the hands of trustees, who administer it for the benefit of his family, creditors, and heirs; and it is restored to him on his return, or to his next of kin after his death, if he dies an emigrant. For other particulars we refer readers to the code itself, as many misrepresentations of its provisions have gone about the world, in books of travels or political pamphlets, few of the authors of which have taken the trouble of ascertaining the truth. There is however one work, with a half-official character, which has undertaken to refute many of the most extravagant charges made against the Austrian administration in Lombardy, by appealing to texts, dates, and notorious facts. (*Semplice Verità in risposta alle Accuse di Enrico Misley*, Paris, 1834.)

Religious toleration is guaranteed by the Austrian laws. The Protestants have a chapel at Venice, and another at Bergamo. The Greek or Eastern communion has a church at Venice; and the Jews have synagogues at Venice, Mantua, Padua, and other towns.

The Italian regiments are,—eight of infantry, of three battalions each; one battalion of chasseurs, or light infantry; and one regiment of cavalry. These are numbered among the other regiments of the Austrian army, and, like them, are called to do duty in any part of the monarchy. There are besides two garrison battalions at Mantua and Venice; and a corps of gendarmerie for the police service. There is a military college and a school of artillery at Milan. The navy consists of from thirty to forty vessels of war, including three ships of the line; and its principal station is at Venice, where there is a college for cadets, also a corps of marines, and a battalion of naval artillery. In all, the number of the military furnished by the kingdom in time of peace amounts to about 30,000 men, being one man to 149 inhabitants. [AUSTRIA, EMPIRE OF.] There are eight fortresses in the kingdom, namely, Mantua, which is the strongest of all, Peschiera, Legnago, Osopo, Pizzighettone, Rocca d'Anfo, Palmanova, and Venice. The Austrian troops garrison also, conformably to treaties, three frontier places belonging to neighbouring states, namely, Piacenza in the Duchy of Parma, and Ferrara and Comacchio in the Papal State. In most head towns of provinces there is a commandant. The 'comando generale militare,' or military head-quarters, is stationed at Verona.

The hierarchy consists of two archbishops, of Milan and Venice, the latter of whom has the rank of Patriarch; and eighteen bishops. The parishes are 4483, and the clerical seminaries 17. The clergy in all amount to 23,818 individuals.

The judiciary consists of a Tribunale di Prima Istanza, both for civil and criminal matters, in every head town of a province; of two courts of appeal, one at Milan and the other at Venice; and lastly, of a supreme court for the whole kingdom, called the Senate, which sits at Verona. Two commercial courts are established, one at Milan and the other at Venice. In each of the smaller towns is a Pretore, or inferior judge, corresponding to the juges de paix in France. There are 133 Pretori in the whole kingdom.

The Lombardo-Venetian kingdom is generally one of the most fertile countries of Europe; and the industry of the inhabitants and the extensive system of irrigation increase the natural fertility of the soil.

The numerous rivers which come from the Alps are perennial, and the fields of Lombardy never appear in that parched condition which those of southern Italy, and of many parts of Spain and Portugal, exhibit in summer. The most fertile provinces of the kingdom are those of Lombardy proper, and those of Padua, Treviso, Vicenza, Verona, and Friuli, in the Venetian territory. The poorest provinces are Valtellina and Belluno.

Lombardy proper produces in abundance every thing that is necessary for the sustenance of its population; corn, wine, rice, fruits, cheese, and excellent meat. The two principal articles of exportation are:—1, silk, which is exported annually to the amount of eighty millions of Italian livres, or about 3,200,000 pounds sterling, besides silk manufactures of the value of from twelve to fifteen million of livres: 2, rice, of which the average annual produce is valued at about thirty millions of livres, one half of which is exported. The districts in which the rice is cultivated are the low flats of the provinces of Mantua, Crema, Cremona, and part of that of Milan, as well as the provinces of Padua and Rovigo. The cultivation of rice, which requires the fields to be laid permanently under water for a certain period, has been considered by many as productive of diseases among the peasantry, and yet other authorities, persons who are natives of the districts, and medical men also, among others Frank and Adolfi, contend that this is an error, and that the inhabitants of the rice districts, such as Crema, enjoy as much health and as great longevity as those of the hilly countries of Bergamo and Brescia. (*Analisi delle Risaje*, Crema, 1833; and also an article, 'Le Risaje del territorio Cremano giustificate,' in the *Bollettino Statistico* of Milan, June, 1838.) The other articles of exportation are cheese, especially from Lodi, which is erroneously called Parmigiano, and hemp, which is cultivated in the provinces of Padua, Venice, and Rovigo. Salt is imported from Istria, Parma, and Sicily.

The principal manufactures, besides those of silks already mentioned, are glass, especially at Venice, paper, ornamental works in bronze, and straw hats, especially at Bassano, which are equal to those of Tuscany: there are also establishments for spinning cotton, and other minor works. Lombardy is essentially an agricultural country, and receives most of the manufactured goods which it uses from the other parts of the Austrian monarchy. The bookselling and publishing trade, although subject to the censorship, is more flourishing at Milan than in all the rest of Italy put together. About 1000 new works of every description are published annually throughout the kingdom. Expensive engravings, as well as lithographic prints, form a considerable branch of industry. The journals published in the Lombardo-Venetian kingdom amount to nearly forty; there are daily newspapers at Milan and Venice, and weekly ones in most of the head towns of provinces, and the rest are scientific and literary journals, either monthly or quarterly. Milan and Venice have each an academy of the fine arts, and Milan has also a 'conservatorio,' or college for musical pupils.

The public charitable establishments, hospitals, orphan and foundling asylums, houses of industry, Monti di Pietà, &c., in the whole kingdom are to the number of eighty-eight.

The taxes paid by the kingdom amount to about eighty-three millions of livres, or nearly three millions and a half sterling, and the sources of taxation have remained for the most part the same as they were under the French administration, but the respective burthens of some of the taxes, such as the land-tax, the tax derived from the monopoly of salt and tobacco, the postages, &c., have been somewhat alleviated since the Austrian restoration. The latter has abolished the tax which the French government had put on those who exercised the liberal professions, such as artists, literary men, physicians, &c.

With regard to the expenditure, the public officers, and especially the magistrates and judges, are better paid now than they were under Napoleon's government. In the Lombard provinces alone, the stipends of the judges and pretori amount to 2,055,070 livres or francs annually, while under Napoleon they amounted to 1,640,389 livres only. The professors of the universities of Pavia and Padua have also had their salaries increased. We have already seen that the government treasury assists the communes in supporting and extending the system of popular education. The large sums spent annually by the treasury on public works, roads, canals, dykes, bridges, and charitable institutions have also been mentioned above. The conservatory, or school of music, at Milan, under the French was supported by the tax laid on the licensed gambling-houses annexed to the theatres. The Austrian government has suppressed the gambling-houses, and pays out of its treasury 36,000 francs for the conservatorio, and 240,000 as an encouragement to the theatres.

Making every allowance for the political aspirations and disappointed national feelings of many Italians who re[illegible] being dependent on a foreign power, it may be affirmed with safety that the Lombardo-Venetian kingdom is in a thriving and progressive condition, and that it is the best administered country in Italy, excepting perhaps Tuscany.

The general amnesty published in September, 1838, by the emperor Ferdinand, in favour of all political offenders, has contributed to restore a feeling of satisfaction to the bosom of numerous families. Further investigation and discussion on the subject of the Austrian administration in Lombardy may be found in two articles of the *Foreign Quarterly Review*, 'The Austrian Government and the Italian Liberals,' in No. xxvi., May, 1834; and 'Italy and Europe,' in No. xxviii., December of the same year.

LOMBARDY and LOMBARD CITIES. The name of Lombardy, which is derived from that of the Longobards, its former possessors, has been applied in its widest sense, though with no very definite limitation, to that tract of country which the Romans called by the name of Cisalpine Gaul, and which includes the principal part of the basin of the Po, from the point where that river leaves behind it the hills of Montferrat to its entrance into the Adriatic. It consists chiefly of an immense plain nearly two hundred miles in length, and from between sixty to seventy miles in breadth, from the lower offsets of the Alps to the foot of the Tuscan Apennines, besides the numerous valleys which open into it from the north. A physical description of this fine region is given under Po.

The overthrow of the kingdom of the Longobards by Charlemagne did not destroy the political existence of the people. They retained their laws and institutions, their property, and their numerous and powerful nobility; they continued a nation and a kingdom, subject however to the monarchy of the Franks. At Pavia, which was then the capital of the country, the successors of Charlemagne were crowned with the iron crown of Lombardy as kings of Italy, previous to their coronation at Rome as emperors of the West and kings of the Romans. The Longobard law continued in force for the Longobard population, while the descendants of the antient inhabitants, or Romans, as they were called, lived under the Roman law. The name of Lombardy was retained, but only for a part of the former dominions of the Longobards: the duchies of Spoleto, Friuli, Tuscany, and Benevento, although some of them continued to be ruled by Longobard dynasties, were not included in the general name.

The feudal system, according to which the possession of land was the pay of the soldier, and constituted his liability to military service and feudal duties, was more fully developed under the weak successors of Charlemagne, when every duke, count, or marquis began to consider himself as independent, and in order to support his independence, divided and subdivided the land belonging to him among numerous subfeudatories called vavassors, who swore fealty and homage to him, and were bound to follow him to the wars.

At the same time, that is to say, about the ninth century, the towns began to rebuild their walls, which had been razed by the barbarians, in order to defend themselves against the incursions of the Hungarians, Saracens, and other predatory bands. The towns had retained the antient system of curiæ, or municipalities, and the citizens elected their own magistrates. The distinction between Longobard and Roman became gradually obliterated among the people; they were all Italians or Lombards together.

After the deposition of Charles the Fat in 888, the crown of Italy was disputed for about seventy years among a succession of pretenders, Italians and Burgundians, until Otho I. of Saxony seized it with a firm hand, and was crowned at Rome by the pope, A.D. 961. Otho and his successors resided chiefly in Germany; they came now and then into Italy at the head of armies, when they generally pitched their tents and held their sovereign court in the plain of Roncaglia near Piacenza, whither all the great feudatories of Lombardy and other parts of Italy, and the magistrates of the towns, were summoned to pay their homage, and to listen to the sovereign's decisions and 'placita.' But with the emperor's return to Germany the great vassals retired to their castles, and the magistrates and bishops returned to their cities. Each town and district was in a manner independent of every other, all acknowledging allegiance to a distant sovereign.

The political system of most towns of North Italy in the tenth and eleventh centuries consisted of the nobles, feudatories, and subfeudatories, at the head of whom were the respective archbishops or bishops, and of the principal citizens, who constituted their council, and were consulted by them. The citizens elected their magistrates, called *scabini*, subject to the approval of the bishop. The emperors appointed to the sees, the old mode of election by the clergy and people having fallen into disuse in consequence of the bishops having become feudatories of the empire. The emperors also appointed from time to time their missi, or commissioners, who were often Italian nobles or prelates, and were the representatives of the imperial authority. As for the supposed municipal charters granted to the towns by Otho I., there is no evidence of them. A veil covers the first period of the history of the municipal emancipation of the towns of Lombardy, for no historian of the tenth or eleventh century has traced its progress; it grew silently under the reign of Otho and his successors, the citizens slowly and gradually appropriating to themselves the prerogatives of the sovereign, and not wishing to attract attention to their encroachments.

Towards the middle of the eleventh century we find discord first breaking out in Milan and other cities between the various classes of the population. The vavassori, or inferior nobles, of whom there were several gradations, owing to the extensive system of subfeudation, or subtenure, rose in arms against the great nobles, at the head of whom was the archbishop Heribert. The archbishop defeated them and drove them out of Milan, but being joined by the malecontents from the neighbouring towns, they appealed to the emperor Conrad, who came to Italy in 1036, and deposed and imprisoned the archbishop. Heribert soon made his escape, and returned to Milan, where he was joyfully received by the clergy, the nobles, and the people, and in order to defend himself against the imperial forces he called to arms the people of every district of the town, without distinction of condition. Till this time the use of arms had been a privilege of the nobles or milites. On this occasion Heribert introduced the carroccio, or cart drawn by oxen, in imitation of the ark of the Israelites, with the great banner of the city fixed upon it, which was drawn in the midst of the militia, and upon which stood the leaders, who from a raised platform gave their directions during the fight. By degrees every city adopted the carroccio, which became a kind of palladium, and the emblem of popular independence. Thus it was that the episcopal government of Milan and other cities prepared the way for their municipal liberty. In 1041 the plebeians or burghers rose against the whole class of nobles, owing to some insult offered by one of them to a common citizen. Lanzo, himself a noble, led the people; a battle was fought in the streets, and the nobles were obliged to leave with their families. The archbishop Heribert, who this time had taken no part in the quarrel, emigrated with the rest. The nobles, being joined by others, blockaded Milan, and reduced the citizens to famine, when after three years Lanzo managed to bring about a reconciliation, and the nobles returned. In fact, the citizens could not well do without them, for they formed the only cavalry; and their acquaintaince with the world and their connexions with other states made them useful in the councils.

In 1059 began the long struggle at Milan and in the rest of Lombardy on account of the married clergy. The church of Milan had its peculiar liturgy and system of discipline, called Ambrosian from its great bishop St. Ambrose, and was almost wholly independent of Rome. According to this discipline married men could be ordained priests, as in the Eastern church, and could continue to live with their wives, though an unmarried priest could not marry after his ordination. If a priest became a widower and married again, he was interdicted from exercising his functions. Several passages in the works of St. Ambrose seemed to countenance this system, which existed for ages in other parts of the Western church, notwithstanding several councils had attempted to enforce celibacy among the clergy. At last the council of Pavia, A.D. 1021, in which pope Benedict VIII. presided, attended by the archbishop Heribert, decreed that married priests should separate from their wives and observe in future perpetual celibacy. But the archbishop did not strictly enforce this decree in his diocese, and things continued as before till long after his death (Giulini, *Storia di Milano*, vol. iii.), when several fanatics, among whom was a deacon, excited the people against the married clergy, and against the archbishop Guido, who favoured them; and great disorders followed. Hildebrand, afterwards Gregory VII., who directed the councils of Rome at the time, took part with the zealots, with the view of subjecting the see of Milan entirely to that of Rome. Pope Alexander II. undertook to enforce the decree of celibacy, and he sent for the purpose Erlembaldo as his legate to Milan, giving him a consecrated standard, and issued at the same time a brief forbidding any one to hear the mass of a married priest. This was in the year 1063, and it revived the tumults in Milan. Erlembaldo, supported by a troop of factious persons, insulted the clergy and even drove them from the altar. Then came a bull of excommunication from Rome against the city of Milan, because its clergy and people would not submit to the papal orders. The archbishop however stood firm on the rights of his see, and the people, taking his part, drove away the zealots and the agents of Rome. Weary of the struggle, the archbishop at last resigned, and Gotofredus, a Milanese cardinal, was elected in his stead and consecrated by the suffragans. Pope Alexander excommunicated him, and appointed a certain Attus in his place. Civil war now raged at Milan for several years, until Erlembaldo, the great leader of the zealots, was killed in an affray in the year 1076, to the great joy of the citizens. Gregory VII., for he had now become popo, seeing that force could not subdue Milan, began to weaken its metropolitan by detaching the suffragans from his jurisdiction, annexing Como to the patriarchate of Aquileia, Aosta to the archbishopric of Tarantasia, and Coira to that of Mainz. Genoa and Bobbio were detached from the jurisdiction of Milan at a later period. The great influence which Gregory acquired through the aid of the Countess Matilda, and his triumph over the emperor Henry IV., facilitated the subjection of the see of Milan, whose archbishops became gradually dependent on Rome, received the pallium from the pope, and swore obedience to him. As a consequence of this the clergy became subjected to the Roman discipline, and the regulation was enforced of not admitting any persons to orders except unmarried men. Nothing is said by the historians about those who were already married, but it appears that they were allowed to live and die in peace. Verri, in his *Storia di Milano*, ch. v., has carefully investigated this curious and obscure period of ecclesiastical history, which saw the extinction of the independence of the Milanese or Ambrosian church.

In the great contest of the investitures, Milan, Lodi, Cremona, and other Lombard cities were at first swayed by the nobility, who were mostly favourable to the emperor, but at last in the decline of the imperial authority they joined the Countess Matilda and her second husband Guelph, with whom they formed an alliance. It was during this long struggle that the cities really established their independence, acknowledging no longer the imperial missi, or vicars. The citizens then began to elect a certain number of magistrates, whom they styled consuls, who administered justice and commanded the militia; they were chosen from three orders, namely, captains, or nobles of the first rank, vavassori, and burghers. How the consuls were elected, how many there were, and how long they remained in office, is not ascertained; for the chroniclers of those times do not enter into these particulars. We find as many as twenty consuls at the same time mentioned. The rural nobles inscribed themselves among the citizens, and came to reside, at least for part of the year, in the city, in order that they might participate in the political rights. A council of credenza, 'trust,' consisting of a certain number of citizens of each class, formed a town-council, which deliberated in secret. On important occasions the parliament, or general comitia of the people, was convoked by the sound of the great bell, to give their opinion by acclamation on some matter which had already passed the council of trust. The decisions were promulgated in the name of the 'popolo,' or 'commune,' which meant the whole community. There was no distinction between the judicial and executive powers, nor any real legislature; and for this reason, that the right of making laws was still considered as a prerogative of the king or emperor, assisted by the magnates, or great feudatories, and by the judges, at the great diets convoked for the purpose in the plain of Roncaglia. Laws and written constitutions were few in those times, and the consuls enforced the customs and precedents, 'consuetudines et usus,' which were collected, in 1216, in a kind of code, and published at Milan and other cities. The war of the investitures being over, the cities continued to acknowledge, at least nominally, the emperor's sovereignty over Italy, his right of exacting military service, of giving the investitures of feudal tenures, of sending royal and imperial judges distinct from the magistrates of the people, of demanding the 'foderum,' or tribute for the maintenance of the emperor and his suite whenever he came to Italy, and lastly of sending from time to time his 'missi,' or vicars, who represented the person of the sovereign.

The Lombard cities, having now secured their municipal liberties, began to fight among themselves. Milan and Pavia were rivals of old, and Cremona, which was the third great city of Lombardy, was also jealous of Milan. But before they turned their arms against one another, they began by attacking their weaker neighbours. Cremona attacked Crema, Pavia attacked Tortona, and Milan attacked Lodi and Novara. At last Lombardy became divided between two parties: that of which Milan was the head included Brescia, Crema, and Tortona; and the other consisted of Pavia and Cremona, Lodi and Como. It was not ambition alone that led them to fight; it was an exuberance of animal courage, the pride of physical strength, which led one city to send challenges to another to fight on a certain day and place, to decide which of the two people was the most valiant. 'We cannot,' says Mr. Hallam, in his '*Europe during the Middle Ages*,' 'extend our sympathy for the free institutions of the Italian cities to the national conduct of those little republics. Their love of freedom was alloyed by that restless spirit, from which a democracy is seldom exempt, of tyrannizing over weaker neighbours. They played over again the tragedy of antient Greece, with all its circumstances of inveterate hatred, unjust ambition, and atrocious retaliation, though with less consummate actors upon the scene.'

The people of Milan had been engaged in frequent disputes with those of Lodi, as early as the time of the archbishop Heribert, who had forced on Lodi by his arms a bishop of his own choice. From this time a mutual rancour continued to exist between the two cities, which lasted for nearly a century. In 1107 the Milanese made war upon the people of Lodi, destroyed their harvests for four consecutive years, and at last, in June, 1111, took the town, killed many of the inhabitants, plundered the rest, razed their houses, and drove the survivors to the neighbouring villages. The spot is still known by the name of Lodi-Vecchio. The people of Pavia on their side took Tortona and burnt it. In 1118 the Milanese began a furious war against Como, which lasted ten years, and which an anonymous contemporary poet has compared with the Trojan war. In 1127 the people of Como were obliged to submit to pay tribute to Milan, and the walls of their town were razed. The distant emperors, whose authority since the war of the investitures had become almost null, did not attempt to check these disorders. But in the year 1152 Frederic of Hohenstauffen, a man of a different stamp from his predecessors, was chosen emperor by the electors of Germany, and in 1154 he crossed the Alps, assumed the iron crown of Italy at Pavia, and afterwards the imperial crown at Rome. He was beset on his way by Italian envoys, especially from Lodi, who complained of the tyranny of Milan and the other dominant cities.

Frederic spoke to the Milanese the language of reason and justice; he ordered them to let their neighbours of Lodi live in peace, and allow them to rebuild their town. The Milanese with scorn refused to obey, and the war began between the emperor, joined by the militia of Pavia and Cremona on one side, and the Milanese and their allies on the other. The war lasted several years, and horrid cruelties were committed by both parties. At last Milan was obliged to surrender, in March, 1162; the inhabitants were ordered to leave the town with all they could carry, after which Milan was sentenced to be treated as it had treated Lodi—to be razed to the ground; and the people of Cremona, Pavia, Lodi, and Como readily executed the sentence. The Milanese were scattered in the villages around. Thus far the treatment of Milan was only a just retaliation: but a change took place in the character of the conquering party: the conquerors abused their triumph, and the former oppressors became the oppressed without having given fresh provocation. Frederic having returned to Germany, his officers and podestas treated the Milanese and other Lombards with the most unsparing rigour, and oppressed them in every way. Even the towns of the Imperial party, such as Cremona, were not treated much better: they were allowed to retain their consuls, but were oppressed with taxes. The emperor was applied to for redress, but in vain. At last a general spirit pervaded the cities of Lombardy, and extended to those of the Marches of Verona and Treviso beyond the Adige. In April, 1167, a secret conference was held by deputies of the various cities, in the convent of Pontida, in the territory of Bergamo; and it was resolved to form a league for the common protection, and to assist the Milanese in rebuilding their city. Pope Alexander III declared himself protector of the Lombard league, which consisted of fifteen cities: Cremona, Bergamo, Brescia, Ferrara, Bologna, Modena, Milan, Parma, Piacenza, Verona, Vicenza, Padua, Venice, Treviso, and Lodi, which was obliged to follow the rest. The league was afterwards joined by Ravenna, Rimini, Reggio, Bobbio, Tortona, Vercelli, Mantua, and Novara. Pavia only remained attached to the emperor's party, and as the marquis of Montferrat took the same side, the allies, after rebuilding Milan, founded a new town on the borders of Montferrat, which they called Alessandria, from the name of their protector. The towns re-established their consular governments, and a kind of federal diet was assembled at Modena, composed of consuls of the various cities, who were styled rectors of the league. But this appearance of a federal union lasted only as long as the contest with Frederic, after which it dissolved itself. The league however carried its purpose bravely for the time. After several campaigns, the Lombard militia completely defeated the Imperial army at Legnano, in May 1176, took the emperor's camp, and Frederic was obliged to escape alone to Pavia. This led to a truce, and afterwards to the peace of Constance, in 1183. By this celebrated treaty, which served for ages after as an authority for regulating questions which arose between the German empire and the North Italian states, the cities were confirmed in their independent administration; they had the right of declaring war, of coining, in short all the attributes of sovereignty, under an acknowledgment however of the emperor as king of Italy and their suzerain, who appointed an imperial vicar to represent him in Lombardy, as well as judges of appeal in civil matters; and they were bound to furnish him with foderum on his passage, as well as with a military contingent against other states who were not members of the Lombard league.

The glorious struggle of the Lombards for their independence being terminated, they soon fell again to quarrelling among themselves. Several of the towns, in order to check their internal factions, adopted the institution of the Podesta, which Frederic had first introduced. This officer was a kind of dictator; he was supreme judge, assisted however by lawyers or assessors, and had the right of inflicting capital punishment. He was always chosen from the territory of another town, and from among the nobility, and changed generally every year. It was imagined that by chosing a stranger, impartiality might be better secured. Milan chose, in 1186, for its podesta, Uberto Visconti of Piacenza. The consuls still remained as magistrates of various kinds. The first in rank were styled 'Consuls of the Commune,' and they commanded the militia of the respective districts of the city. There were also 'Consuls of Justice,' who were justices of the peace, and 'Consuls of the Merchants,' elected by the various trades. The consuls of the commune had the administration of the finances, but were obliged to consult with the council of credenza. In 1198 a fresh rupture broke out at Milan between the nobles and the 'popolani' or burghers. The latter insisted on having their separate council, which was called 'Credenza di Sant' Ambrogio,' and it happened that several nobles sided with the popular party, and had their names inscribed in the registers of trades. The Credenza di Sant' Ambrogio was at first composed of artisans; the wealthier citizens, merchants, and men of liberal professions formed another distinct credenza, which they called Della Motta. The valvassori, or inferior nobles, formed likewise their own council (Verri says they joined that of La Motta) distinct from that of the higher nobles or capitani, who, with the archbishop at their head, assembled in their own council, called 'Credenza dei Gagliardi.' Each of these councils had its consuls, who made edicts for those under their respective jurisdiction. In matters concerning the whole state, deputies from each class assembled in a general council, the numbers of which appear to have varied from 800 to 1000. The manner of electing these deputies, their condition and qualifications, and the duration of their office, are not ascertained. The podestà summoned the general council upon important occasions.

The four credenze however generally resolved themselves into two parties, the nobles and the popolani (or plebeians). The nobles of that epoch were strong by their connexions, their subfeudatories and dependents, forming altogether a numerous and compact body, the most warlike part of the population; they were the only cavalry that had stood the brunt of the wars against Frederic Barbarossa. Their superior address, their acquaintance with foreign courts and councils, gave them great advantage; the archbishop and his dependents were on their side; and so in most cases was the podestà, as he also was a noble. But they were haughty and overbearing towards others, and quarrelsome among themselves; and the burghers on their part, as they became wealthier, would no longer brook their assumed superiority. The consequence was that the nobles were driven out of Milan and Brescia, but they returned, being supported by their friends from Cremona and other places. Reggio, Bologna, and other cities were likewise distracted. Besides these internal feuds, there was the old rivalry among the towns, which revived after their united contests with the emperor had terminated. The interminable list of these petty wars, which is given by Bossi and other historians, without any intelligible account of the origin of most of them, excites a feeling of indignation mixed with contempt; people were killed, property was destroyed, and families were made unhappy by these absurd feuds.

One half of the index of the fifteenth volume of Bossi's 'History of Italy,' which comprises the events of the thirteenth century, consists of such heads as these:—Wars of the Lombard cities; private wars of various Italian cities; other wars of the Italian cities; fresh contests between the Italian cities; peace made between several cities; wars and tumults in the cities; wars of the Italian cities (this head is repeated at least twenty times); wars of Lombardy; tumults of Brescia and Milan; tumults at Piacenza; wars in Lombardy and other parts of Italy; wars of Romagna, Genoa, Tuscany, &c.; and all this independent of the great struggle which was then carried on between the popes and Frederic II. and his son Manfred. [GUELPHS AND GHIBELINES.]

Such was the condition of the *free* Italian cities in the thirteenth century, and such the manner in which their citizens enjoyed that independence for which their fathers had bravely fought at Legnano. The eloquent panegyrist of the Italian republics of the middle ages attempts to excuse their pugnacious propensity by observing that 'there were then no regular soldiers like ours, who have now to bear all the privations and dangers of war; military service was then a temporary duty, the pleasure and pastime of every citizen, to which he consecrated a few days every year; he fought in sight of his own walls; if he was wounded he was brought back to his own house; and if he died his loss was lamented by all his townsmen' (Sismondi, *Républiques Italiennes*, ch. xv.); and further on he says that 'in all the quarrels of the wealthier citizens, first with the nobles, and afterwards with the lower classes, civil liberty was frequently violated, and personal rights and security were often overlooked; but while in the midst of these disorders civil liberty was trampled upon, democratic liberty remained. Democratic liberty consists, not in security, but in power; it does not ensure to nations either tranquillity or order, economy or prudence, but it carries within itself its own reward. It affords the sweetest enjoyment to the citizen who has once tasted of it, in the gratification of influencing the fate of his country, and of sharing in its sovereignty, not acknowledging any authorities he has not himself created.' (*Républ. Ital.*, ch. xxv.) This is a portrait of democracy by one of its ablest and most conscientious apologists.

It has been said that notwithstanding all these feuds the Italian free cities prospered; the real truth is that some of them flourished at the expense of the others. It is observed that a number of towns which are mentioned as being of importance in the eleventh century, had disappeared in the thirteenth. We read of the glory and wealth of Milan and Florence, but we take no account of the depopulation and calamities of Lodi and of Pisa; it is the same with ancient history. We see Rome growing and thriving, but we are apt to overlook the numerous towns of Latium and of Samnium which were annihilated through her predominance. Several causes contributed to keep up the wealth of the great Lombard cities during the middle ages; the extraordinary fertility of their territory, their manufactures, in which they were unrivalled in Europe, and the practice of their citizens of lending money at high interest throughout Europe, from whence the name of Lombard became synonymous with that of banker as well as usurer. But however flourishing the cities might be, the subject country had little participation in their splendour, and the greatest sufferers in the continual wars between them were the unfortunate country-people, who in all these republics had no political rights, had no voice in these quarrels, but were doomed to suffer from both parties, who treated them like dogs. The chronicler Ferratus of Vicenza makes an appalling sketch of the sufferings of the rural population, of which Sismondi gives an extract in ch. xxviii. of his history.

In the contests between the popes and Frederic II. the Lombard cities were divided: Milan, Brescia, Piacenza, and Modena were against the emperor; Cremona, Parma, Modena, Reggio, were for him. But his most effective ally was Eccelino da Romano, whom the Veronese had made their podestà, and who contrived in the midst of the confusion to make himself master not only of Verona, but also of Vicenza and Padua, and all the Marches. In 1237 Frederic attacked the Milanese and their allies at Cortenova, near the river Oglio, and completely defeated them. Still the emperor was prevented by other accidents from pursuing his advantage, and Milan was saved. A desultory war continued till his death.

Meantime renewed affrays between the nobles and the burghers of Milan induced the latter, who were dissatisfied with the podestà for favouring the nobles, to have a distinct podestà, or magistrate for themselves, as they had already a separate credenza and separate consuls. They chose for this office Pagano della Torre, lord of Valsassina, a powerful feudatory, who had been of great use in the Milanese after the defeat of Cortenova, and they styled him 'Protector of the people.' The nobles had now for their champion the archbishop Fra Leone da Perego, a fanatical monk, who distinguished himself by his subserviency to the pope, and his zeal against the Cathari, a kind of heretics, many of whom were burnt at Milan. On the death of Pagano della Torre, the people chose his nephew Martino for their chief magistrate, with the title of 'Elder,' 'Anziano della Credenza,' for an indefinite time. He was afterwards styled 'Signor del Popolo,' 'lord of the people.' The nobles chose for their podestà Paolo da Soresina. Martino however had the advantage, and expelled Soresina. The nobles had then recourse to Eccelino da Romano, who ruled Vicenza and Verona, and had also taken Brescia. He advanced towards Milan with a splendid army, crossed the Adda, but found himself hemmed in by enemies on all sides, his own former friends Oberto Pelavicino of Cremona and Buoso di Doara, both Ghibelines, having turned against him. He attempted a retreat, but was wounded and taken prisoner, and died of his wounds, in October, 1259.

The exiled nobles of Milan still kept the field, and Martino della Torre, unable to reduce them for want of cavalry, engaged Pelavicino and his troops in the service of Milan, with the title of captain-general for five years and a pension. This was the beginning of the practice so prevalent afterwards of hiring mercenary troops, or condottieri. The Milanese emigrants were besieged in the castle of Tabiago, near Brianza, where having exhausted their provisions and the water of the wells, and their horses having died, they surrendered at discretion. They were taken to Milan in chains, and confined in iron cages exposed to public view, and kept there for years.

In 1260 Martino della Torre was chosen by the towns of Lodi and Novara as their 'signore,' or lord, which in those small communities implied a more absolute authority than that which he had at Milan. The fashion spread; Cremona chose for its lord the marquis Pelavicino; Verona chose any real legislature; and for this reason, that the right of making laws was still considered as a prerogative of the king or emperor, assisted by the magnates, or great feudatories, and by the judges, at the great diets convoked for the purpose in the plain of Roncaglia. Laws and written constitutions were few in those times, and the consuls enforced the customs and precedents, 'consuetudines et usus,' which were collected, in 1216, in a kind of code, and published at Milan and other cities. The war of the investitures being over, the cities continued to acknowledge, at least nominally, the emperor's sovereignty over Italy, his right of exacting military service, of giving the investitures of feudal tenures, of sending royal and imperial judges distinct from the magistrates of the people, of demanding the 'foderum,' or tribute for the maintenance of the emperor and his suite whenever he came to Italy, and lastly of sending from time to time his 'missi,' or vicars, who represented the person of the sovereign.

The Lombard cities, having now secured their municipal liberties, began to fight among themselves. Milan and Pavia were rivals of old, and Cremona, which was the third great city of Lombardy, was also jealous of Milan. But before they turned their arms against one another, they began by attacking their weaker neighbours. Cremona attacked Crema, Pavia attacked Tortona, and Milan attacked Lodi and Novara. At last Lombardy became divided between two parties: that of which Milan was the head included Brescia, Crema, and Tortona; and the other consisted of Pavia and Cremona, Lodi and Como. It was not ambition alone that led them to fight; it was an exuberance of animal courage, the pride of physical strength, which led one city to send challenges to another to fight on a certain day and place, to decide which of the two people was the most valiant. 'We cannot,' says Mr. Hallam, in his 'Europe during the Middle Ages,' 'extend our sympathy for the free institutions of the Italian cities to the national conduct of those little republics. Their love of freedom was alloyed by that restless spirit, from which a democracy is seldom exempt, of tyrannizing over weaker neighbours. They played over again the tragedy of antient Greece, with all its circumstances of inveterate hatred, unjust ambition, and atrocious retaliation, though with less consummate actors upon the scene.'

The people of Milan had been engaged in frequent disputes with those of Lodi, as early as the time of the archbishop Heribert, who had forced on Lodi by his arms a bishop of his own choice. From this time a mutual rancour continued to exist between the two cities, which lasted for nearly a century. In 1107 the Milanese made war upon the people of Lodi, destroyed their harvests for four consecutive years, and at last, in June, 1111, took the town, killed many of the inhabitants, plundered the rest, razed their houses, and drove the survivors to the neighbouring villages. On the death of Pagano della Torre, the people chose his nephew Martino for their chief magistrate, with the title of 'Elder,' 'Anziano della Credenza,' for an indefinite time. He was afterwards styled 'Signor del Popolo,' 'lord of the people.' The nobles chose for their podestà Paolo da Soresina. Martino however had the advantage, and expelled Soresina. The nobles had then recourse to Eccelino da Romano, who ruled Vicenza and Verona, and had also taken Brescia. He advanced towards Milan with a splendid army, crossed the Adda, but found himself hemmed in by enemies on all sides, his own former friends Oberto Pelavicino of Cremona and Buoso di Doara, both Guibelines, having turned against him. He attempted a retreat, but was wounded and taken prisoner, and died of his wounds, in October, 1259.

The exiled nobles of Milan still kept the field, and Martino della Torre, unable to reduce them for want of cavalry, engaged Pelavicino and his troops in the service of Milan, with the title of captain-general for five years and a pension. This was the beginning of the practice so prevalent afterwards of hiring mercenary troops, or condottieri. The Milanese emigrants were besieged in the castle of Tabiago, near Brianza, where having exhausted their provisions and the water of the wells, and their horses having died, they surrendered at discretion. They were taken to Milan in chains, and confined in iron cages exposed to public view, and kept there for years.

In 1260 Martino della Torre was chosen by the towns of Lodi and Novara as their 'signore,' or lord, which in those small communities implied a more absolute authority than that which he had at Milan. The fashion spread; Cremona chose for its lord the marquis Pelavicino; Verona chose

Martino della Scala; Mantua, the count San Bonifazio; Ferrara, the marquis of Este, &c. The desire of tranquillity and repose from factions induced the citizens to submit to a chief who could make himself feared, and they chiefly required of him to punish quickly and severely those who troubled the public peace. They preferred summary and often brutal justice to anarchy.

After the death of Archbishop Perego the chapter was divided, as to the choice of his successor, between a nephew of Martino della Torre and another. Pope Alexander IV., who was offended with Martino for having allied himself with Pelavicino, a Guibeline, and suspected of heresy, named to the see the canon Otho Visconti, of a noble and powerful family, who had been exiled with the other nobles some years before. But as the Della Torre opposed his coming to Milan, considering him as an emigrant, the archbishop elect continued for several years to remain on the estates of his family near the lake of Como, where he collected many of the disaffected, with whom he carried on a sort of predatory warfare against Milan. Martino della Torre having died in 1263, his brother Philip succeeded him as lord of Milan, Lodi, and Novara, to which he added Como, Vercelli, and Bergamo, which towns elected him as their lord. Thus the foundation was laid of that consolidation of Lombardy into one state which in after-times was known by the name of the duchy of Milan. Philip della Torre died in 1265, and was succeeded by his nephew Napoleone della Torre. The Torriani, or Della Torre family, did not alter the form of the institutions of Milan; the podestà, the credenza, and the consuls remained as before, with an authority independent, apparently at least, of that of the lord. This policy was the same as that pursued by the first Medici at Florence.

As long as Pope Gregory X. lived, the archbishop Visconti was cautious in his movements, as that wise pontiff did not choose to encourage the preponderance of either Guelphs or Guibelines; but after his death in 1276 Visconti grew bolder; he took possession of Como and Lecco, and at last marched against Milan. Napoleone della Torre came out to meet him, but was surprised and taken prisoner, and he and his relations were confined in cages, after the example set by his uncle Martino. The people of Milan, hearing of the defeat, rose against the adherents of the Torriani, pelted them with stones, and drove them out of the city. A deputation of citizens was sent to the archbishop Visconti, whom they saluted as 'Perpetual Lord of Milan.' This occurred in January, 1277. 'It was but one dynasty supplanting another. The Torriani, who had raised themselves by acting the part of demagogues, introduced monarchical habits, depressed the nobles, and drove them into exile. The Visconti, returning at the head of this long-proscribed nobility, which was now ruined in fortune, and had become mercenary, found the people corrupted by servitude. There was no longer any independence of spirit in any class, no elevation of character or love of liberty; and although republican councils and popular institutions continued for a long time after, the principle of life which once animated them was extinct, and the sovereign power was transmitted by the first and virtuous Visconti to their imbecile and vicious descendants, without the nation attempting to recover it from their grasp.' (Sismondi, *Républ. Ital.*, ch. xxii.)

The power of the Visconti, though in fact hereditary, was at first, at least in form, dependent on the sanction of the people, who, at the death of the actual lord, elected his successor. The council of the elders continued to discuss the laws which the lord proposed, to levy the taxes, superintend the expenditure, and to exercise the other functions of a legislature. But gradually, and especially from the time of Bernabò Visconti, the lord took upon himself to issue his own laws or statutes, to impose taxes, let to farm the revenue, make war, and, in short, exercise all the acts of sovereignty. In the fourteenth century the Visconti ranked among the most powerful Italian princes. They extended their dominions not only over Lombardy Proper, north of the Po, but over part of Montferrat, including Asti, Alessandria, Bobbio, Tortona, and also to Parma, Piacenza, Bologna, and other towns south of the Po. Gian Galeazzo Visconti received in 1395, from the Emperor Wenceslas, the title of 'Duke of Milan and Count of Pavia.' The charter of investiture included twenty-six towns and their territories, extending from the hills of Montferrat to the lagoons of Venice. Besides these he obtained also possession by force or fraud of Genoa, Lucca, Pisa, Siena, Perugia, Bologna, and other parts of Romagna. Florence alone stood in his way, and he was preparing to attack it with all his forces, when he died of the plague, in September, 1402. In the following century the duchy of Milan became circumscribed within narrower limits. The Venetians took the three provinces of Brescia, Bergamo, and Crema, between the Mincio and the Adda, which last river became the boundary of the two states. The Swiss took possession of Bellinzona, and other valleys north of the Lago Maggiore. The duchy of Milan likewise lost its conquests south of the Po. On the side of Piedmont its boundary was the Sesia, including within its limits the extensive province of Novara, which now forms part of the Sardinian territories. The duchy of Milan therefore, as possessed by the later Visconti and their successors the Sforza, from whom it came into possession of Charles V., extended about 70 miles north to south from the Alps to the Po, and 60 miles east to west. Its principal cities were Milan, Pavia, and Cremona. Mantua formed a separate duchy until the war of the Spanish succession, when it was taken possession of by the house of Austria, and annexed to the duchy of Milan. These two duchies constituted Lombardy Proper. The duchy of Milan, during a century and a half that it remained under the Spanish branch of the house of Austria, declined greatly from its former prosperity. The delegated absolutism of Spanish viceroys and governors was fatal to Milan, Naples, and Sicily. The wretched system of that administration and the misery of the population subject to it have been admirably portrayed by Manzoni, in his 'Promessi Sposi,' and by Cantú, in his 'Ragionamenti sulla Storia Lombarda del Secolo xvii.,' which is a commentary on the work of Manzoni.

With its transfer to the German branch of the house of Austria Lombardy began to recover its prosperity. But it was under the reign of Maria Theresa that improvements of every sort proceeded with rapid strides, and the duchy of Milan assumed a new aspect. The population also increased rapidly. In 1749 it was 900,000, and in 1770 it was 1,130,000. Joseph II. pursued the career of improvement in Lombardy, and Verri, who wrote his history of Milan at the time, remarked upon the dense population of this limited tract of country, and its fertility, which, besides abundantly supplying its inhabitants with all the necessaries of life, left them an annual surplus of produce for exportation to the amount of 1,350,000 sequins, about sixteen millions of francs. The consequence of all this was, that the people of Lombardy grew attached to the Austrian sway, and when the French, in 1796, invaded the country, they found the inhabitants in general extremely cool towards them and their republican doctrines. The partisans of the French gathered from other districts, from the Venetian provinces of Bergamo and Brescia, and also from Modena, Bologna, and other countries south of the Po, which were not so well administered as the Milanese. The subsequent vicissitudes of Lombardy are noticed under the LOMBARDO-VENETIAN KINGDOM.

LOMBEZ. [GERS.]

LOMBHOOK, or **LOMBOK**, an island of the Indian Archipelago, lying between 8° and 9° S. lat. and 116° and 117° E. long. It has the island of Bali on the west, and that of Sumbhawa on the east. The form of Lombhook is nearly square; its mean length and breadth being respectively 53 and 45 miles. The surface of the island is mountainous. The loftiest of its mountains, the peak of Lombhook, is said to rise to the height of 8000 feet above the level of the sea. The island is populous and well cultivated, and the whole surface is covered with verdure. It is abundantly supplied with springs of water, which feed several small streams; some of which fall into the sea on the west side, where there is a commodious harbour. Ships which enter the harbour may procure from the natives abundant supplies of oxen, swine, goats, poultry, and vegetables. The inhabitants, who are generally intelligent, and have attained a considerable degree of civilization, carry on a brisk traffic with Java and Borneo; their chief food is rice, which they cultivate by means of large tanks and reservoirs of water. The ruler or rajah of Lombhook is tributary to the sultan of Bali, and the island has never been brought under subjection by any European power.

LOMOND, LOCH, is a lake in Scotland, extending between 56° and 56° 20′ N. lat., and 4° 30′ and 4° 42′ W. long., in a direction from north by west to south by east. On the east side it is bounded by the counties of Stirling and Forth, and on the west by that of Dumbarton. Its length is 24 miles. The most southern portion, which is nearly one-third of its length, is from four to seven miles across, and contains several wood-clothed islands. The whole number of islands in the lake is about thirty. North of Luss in Dumbartonshire it grows gradually narrower, being from two to one mile and even less in width. According to the 'Statistical Report of Scotland' it covers a surface of 45 square miles. Its general depth is about 20 fathoms, but in some places it is as much as 80 and even 100 fathoms. The surface is 22 feet above the mean level of the sea at Dumbarton. Its waters are supplied by a great number of small rivers, which descend from the adjacent mountains; the Endrick, the only considerable stream which falls into it, enters the lake on the east side, at that part where it is widest. The circumstance of so many streams falling into it will account for the fact of the surface of the lake being from three to five feet higher in winter than it is in summer. The river Leven, which issues from its southern extremity, carries the surplus waters to the Clyde. Loch Lomond is well known for the grand and beautiful scenery which its banks exhibit: indeed none of the Scottish lakes present a greater variety of landscape. The river Leven runs through a valley of considerable width, which is highly cultivated. The country around the southern portion of the lake is hilly, but fertile, rich, and well cultivated: it contains a number of gentlemen's seats, surrounded with fine natural woods and plantations, while the lake gives a peculiar charm to the scenery by its rocky but beautiful and finely-wooded islands. Where the lake begins to narrow, Ben Lomond on the eastern bank raises its head to near 3200 feet above the sea. Ben Lomond is a beautiful mountain, rising with a gentle ascent, and covered with fine grass to the very summit. Its beauty is increased by contrast with Tullich Hill and the mountains of Arroquhar, which rise on the other side of the lake with a steep declivity and bare and rocky summits, to nearly the same elevation as Ben Lomond. The northern extremity of the lake is completely enclosed by high, steep, rocky, and dark mountain masses.

LOMONOSOV, MICHAEL VASILIEVITCH, the father of modern Russian poetry and literature, was born in 1711, near Kholmogor, in the government of Archangel. His father, who was a serf of the crown, was by occupation a fisherman, and Michael more than once accompanied him in fishing excursions in the White and Northern seas. The long winters were devoted by him to study, in which he was assisted by the instruction he received from a priest; and although his stock of books was exceedingly limited, being nearly confined to a grammar, a treatise on arithmetic, and a psalter, he made such diligent use of them, that at last he had them all by heart. What he thus acquired served only to increase his desire for further information: he accordingly determined to make his way at once to Moscow, to which capital he journeyed in a cart that was conveying thither a load of frozen fish. Having greatly distinguished himself, first in the Zaikonospaski School there, and afterwards in the university of Kiev, he was sent to complete his education at the Academy of St. Petersburg in 1734, where he applied himself more particularly to mathematics, physics, chemistry, and mineralogy. After two years spent in those studies he was sent to Marburg, in order that he might perfect himself under the celebrated philosopher Christian Wolff, under whom he continued three years, and then proceeded to Freyberg, for the purpose of acquiring a practical knowledge of metallurgy and mining. Yet although chiefly occupied by such pursuits, he did not neglect literature, but diligently read all the best German poets of that period, and determined to rival them. One of his first literary efforts was an ode on the taking of Khotin, which he sent to the empress Anne, and which obtained for him general admiration. In the meanwhile he had married during his residence at Marburg, the consequence of which was that he so involved himself in pecuniary difficulties, that he was obliged to lose no time in returning to his own country. After his arrival at St. Petersburg he was made an associate of the Academy in 1741; and in 1746, professor of chemistry, besides which other appointments and honours were conferred upon him, and in 1760 he was made rector of the gymnasium and university. He died April 4 (16), 1765.

The complete collection of his works, published by the Academy, which has passed through several editions, extends to sixteen volumes; and the titles alone of his works would serve to show the great range and diversity of Lomonosov's studies. It would in fact be difficult to name any one who can be compared with him for the encyclopædical multifariousness of his writings. Chronology, history, grammar, rhetoric, criticism, astronomy, physics, chemistry, meteorology, poetry—all engaged him by turns, and he showed himself to have a genius for all. Later discoveries and improvements in science have of course somewhat dimmed the lustre which his writings of that class at first shed upon his name; but the service he rendered to the literature of his country, both by precept and example, no length of time can obscure. His grammar entitles him to be considered the legislator of the language, and as the first who gave regularity and stability to its elements: in poetry he has scarcely been equalled by any one, with the single exception of Derzhavin, in energy of style and sublimity of ideas; notwithstanding that, unlike those who have succeeded him, he found no model to guide him in any of those who had gone before him, but had to purify and recast the language in which he wrote. Polevoi's biographical novel, entitled 'M. V. Lomonosov,' 2 vols. 8vo., 1836, contains, with some admixture of fiction, almost all that can now be collected regarding the life of this extraordinary man, together with notices of his chief literary contemporaries.

LONCHE'RES, Illiger's name for a genus of *Rodents*, including *Echimys* of Geoffroy, a species of *Hystrix* of Schreber and others, and a species of *Myoxus* of Zimmermann and others. (MURIDÆ; RODENTIA.)

LONCHO'PTERIS, a genus of fossil ferns established by M. Adolphe Brongniart. The species belong principally to the coal formation, but one, Lonchopteris Mantelli, is found in the Wealden deposits and in the green-sand.

The leaves are multipinnatifid, the pinnicules adnate to the rachis, marked by a midrib, and equal reticulated nervures, and uniform areolæ.

LONCHU'RA, a genus of *Fringillidæ*, separated from *Fringilla* (Temm.), by Lieut.-Col. Sykes.

Generic Character.—*Bill* strong, short, broad; mandibles entire, the upper one extending in an angle on the forehead, and, with it, forming the arc of a circle. Wings moderate, subacuminate; first *quill* very short and subspurious; the second, third, and fourth, nearly equal and longest. *Tail* graduated, lanceolate; middle tail feathers a little exceeding the others in length. *Feet* moderate, rather slender.

Col. Sykes observes that the peculiar spear-head form of the tail, and the ridge of the upper mandible and the forehead, forming a segment of the same circle, together with the habits of *Lonchura cinerea*, *Cheet* and *leuconota*, afford sufficient characteristics for their separation. Col. Sykes adds that the *Gros-bec longicaude* of the Pl. Col. 96 (*Emberiza quadricolor*, Lath.), belongs to the same group.

Locality of the three species the Dukhun (Deccan). The first two are recorded as found only in the Ghauts.

Lonchura Cheet, Sykes, is described as of a pale cinnamon-brown; the body below and the rump white; quills and tail-feathers deep brown. Irides deep red-brown. *Female* with the colours less intense. Length of the body 4½ inches; of the tail, 2.

Habits, Reproduction, &c.—Col. Sykes states that these birds live in small families, and that he frequently found them in possession of the deserted nests of the *Ploceus Philippensis*; their own nest, which he exhibited on a subsequent occasion, is a perfect hollow ball, made of a delicate *Agrostis*, with a lateral hole for the entrance of the birds. It was found in the fork of a branch of the *Mimosa Arabica*, and contained ten oblong minute white eggs, not much larger than peas, being $\frac{6}{10}$ths of an inch long by $\frac{4}{10}$ths in diameter. The cry of the bird is *cheet, cheet, cheet*, uttered simultaneously by flocks in flight. (*Zool. Proc.*, 1832 and 1834.)

LONDON, the capital of the United Kingdom of Great Britain and Ireland, stands at the head of the navigable tideway of the river Thames. The latitude of the centre of the dome of St. Paul's cathedral, which stands nearly in the centre of what is strictly the *City* of London, is $51^\circ\ 30'\ 47{\cdot}53''$, and the longitude is $5'\ 48{\cdot}3''$ W. of Greenwich. The latitude of Greenwich Observatory, according to Mr. Airy's determination, is $51^\circ\ 28'\ 38{\cdot}07''$. This portion of the metropolis, the City, including the liberties, or the districts into which the municipal franchises and privileges extend, is divided into two portions, London within the Walls, and London without the Walls, a distinction which exists no longer except in name. The original wall of the City is described as having its beginning at a fort which in part occupied the site of the present Tower of London, whence it was carried northward through the street now called the Minories to Aldgate; thence diverging to the west it crossed Bishopgate churchyard to Cripplegate; then southerly to Aldersgate; thence to the north of Christ's Hospital; turning directly south to Ludgate, it then again took a westerly course to New Bridge Street, and accompanied the line of the Fleet River to its junction with the Thames, where another fort marked its termination. The space within the line thus described comprehends London within the Walls, and includes 98 parishes. London without the Walls consists of the following 11 parishes:—St. Andrew's, Holborn; St. Bartholomew the Great; St. Bartholomew the Less; St. Botolph Without, Aldersgate; St. Botolph, Aldgate; St. Botolph Without, Bishopgate; Saint Bride's; St. Dunstan in the West; St. Giles Without, Cripplegate; St. Sepulchre Without, Newgate; Trinity, in the Minories; besides inns of court, hospitals, and other extra-parochial districts locally connected with the above-named parishes. The whole of London Bridge is held to be within the city, together with a plot of ground at the south end of the old London Bridge on the Surrey shore, and called the Bridge-foot.

These boundaries by no means include what is now understood by the name London. They do not even circumscribe the surface over which its magistracy exercises jurisdiction. The borough of Southwark, on the south side of the Thames, is, for certain purposes, subject to the jurisdiction of the corporate officers of the City of London. A great part of the manor of Finsbury is also held by the corporation by virtue of a lease granted by the prebendary of Haliwell and Finsbury, in the cathedral church of St. Paul, at an annual rent. This lease has been renewed from time to time, and the date of its origin is not recorded; but it is known that the corporation has been thus interested in the manor from the beginning of the fourteenth century. It is now usual to consider it as forming part of the metropolis, or of London, in the large sense of the term, which comprehends the City of London within and without the walls, the city of Westminster, the borough of Southwark, and the newly-created parliamentary boroughs of Finsbury, St. Mary-le-bone, the Tower Hamlets, and Lambeth. The area of these several divisions, with the number of houses and of inhabitants which they contained at the census of 1831, are computed to be as follows:—

	Area in Acres.	Houses.	Population.
City of London . . .	600	17,315	122,395
Southwark	590	22,482	134,117
Westminster . . .	2,500	21,893	202,460
Finsbury	4,670	29,605	224,839
St. Mary-le-bone . .	5,310	27,888	234,294
Lambeth	8,840	29,079	154,613
Tower Hamlets . . .	8,988	66,777	302,519
Total . . .	31,498	215,039	1,375,237

The proportionate increase in the population and number of houses that has been found at each decennary enumeration since 1801 has been as under:—

	No. of Houses.	Inhabitants.
1811 ..	16·98 per cent.	16·73 per cent.
1821 ..	16·19 "	17·66 "
1831 ..	19·42 "	20·04 "

The rate of increase has been by no means uniform in the different districts. Comparing 1831 with 1801, the total increase in the number of houses has been 63 per cent., and in the population 70 per cent.; but as regards the city of London there has been, during the same thirty years, a positive decrease in houses of 5·65 per cent., and of inhabitants 4·43 per cent. The great increase has taken place in the newly-created boroughs; the houses being there augmented in the proportion of 94½ per cent., and the inhabitants 105 per cent. The area of the City being already fully occupied by houses, there was no room for their increase, and little capacity for receiving an addition to the number of inhabitants. The trifling diminution experienced in both particulars in the city is fully accounted for by the widening of streets, and by the increased value of houses for commercial purposes, which has induced many persons to parcel out their dwellings as offices, and to remove with their ies to the suburbs.

enumeration has of late years been made of the streets of London; but it has been computed that, including squares, lanes, courts, and alleys, they amount to between 8000 and 10,000. The principal thoroughfares follow the course of the Thames from east to west. The longest line enters from Essex at Whitechapel, and runs in a nearly straight line to St. Paul's cathedral, where it divides into two arms, one of which continues near the river through Fleet-street and the Strand to St. James's palace; the other arm continues more to the north, through Holborn to the western extremity of Oxford-street and Kensington Gravelpits. From a computation made in December, 1785, it appears there were then, 'in and near the City of London, 100 almshouses, 20 hospitals and infirmaries, 3 colleges, 10 public prisons, 15 flesh-markets, 1 market for live cattle, 2 for herbs, and 23 for corn, coals, hay, &c., 15 inns of court, 27 public squares, 49 halls for companies, 8 public or free schools, 131 charity schools, 207 inns, 447 taverns, 551 coffee-houses, 5975 ale-houses, 1000 hackney-coaches, 400 hackney-chairs, and 7000 streets, lanes, courts, and alleys.'

From the official returns obtained in 1832 by the commissioners appointed to consider concerning the division of counties and the boundaries of boroughs, it appeared that there were at that time in each of the proposed parliamentary divisions the following number of houses rated at the yearly value of 10*l.* and upwards, and the assessed taxes paid within those divisions were as follows:—

	Houses assessed at £10 and upwards.	Amount paid of Assessed Taxes.
City of London . .	14,564	£205,476
City of Westminster .	17,681	303,421
Borough of Southwark .	9,923	51,262
" Lambeth .	16,405	91,069
" Finsbury .	23,266	201,027
" Marylebone .	21,630	282,201
" Tower Hamlets	23,187	93,151
	126,656	£1,227,607

From which it appears that the metropolis contained 28·58 per cent. of the total number of houses rated above 10*l.* per annum value in Great Britain, and that the inhabitants paid 29·61 per cent. of the whole amount of assessed taxes, exclusive of the land-tax.

Soil, &c.—The general substratum of London and its vicinity is clay. [LONDON CLAY.] Beds of clay, from 100 to 200 feet in thickness, proper for making tiles, are found in the immediate neighbourhood of the City, and all around the metropolis brick-making is or has been carried on extensively. The clay is in many parts, especially on the north side of the river, for a distance of more than a mile, covered with a thick bed of gravel.

The mean annual temperature of the air *in* London, as deduced by Mr. L. Howard from a series of observations carried on during twenty years, is 50° 5′. The mean temperature of each month, during the period here mentioned, was—

	°		°
January .	36·34	July .	62·97
February .	39·60	August	62·90
March . .	42·01	September	57·70
April . .	47·61	October	50·79
May . .	55·40	November	42·40
June . .	59·36	December	38·71

The amount of rain which fell in each of the nine years, from 1826 to 1834, in the gardens of the Horticultural Society at Chiswick, and in each month of the year 1834, was as follows:—(It is not known that there is any gauge kept within the limits of the town upon which perfect reliance can be placed.)

	Inches.	1834.	Inches.
1826	21·83	January .	2·87
1827	22·18	February .	0·37
1828	27·85	March .	0·86
1829	26·12	April . .	0·65
1830	24·27	May . .	1·19
1831	26·93	June . .	1·63
1832	21·59	July . .	6·34
1833	25·80	August .	2·73
1834	20·39	September	0·83
		October .	0·43
Average	24·10	November	1·75
		December	0·74
			20·39

According to observations made during a series of years the following table shows the directions in which the wind has blown during each month of the year :—

	N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
January . .	3½	3½	1½	2½	1½	6½	6½	3½
February . .	1½	4¾	2½	2¾	3½	5	3½	3¾
March . .	2½	3	—	7	[illegible]	9½	6½	4½
April . . .	2½	2½	3	2½	2½	4	4½	3½
May . . .	3	4	4½	4	1	6½	5½	3
June . . .	3	6½	2	3	1	5½	3	3
July . . .	2½	3	3	4	1½	7	5	3½
August . .	1	2¾	1½	5	3½	6	11½	3
September . .	2	4	1	4	1	8	6	6
October . .	3	7½	2	7½	2½	2½	4	4½
November . .	3	9	3	9	3	6	6	6
December . .	1	2½	3½	3	2	9½	6	4
	30½	45½	26½	59	23½	78½	76½	65½

Architecture.—Although London is known to have existed as a town for over two thousand years, with the exception of here and there a building, or a mass of old tenements, all the rest is comparatively of yesterday, there being very few portions which are more than a century old, and those in situations where they must be purposely sought out. What Roman London was is now entirely matter of conjecture, for although pavements and other fragments of antiquity have been from time to time discovered, they merely prove that Roman structures of some splendour formerly existed on the sites where such remains have been dug up; but in regard to the buildings themselves they afford no information; still less do they assist us in forming any idea of the general mode of building and the aspect of the city. Imagination may speculate freely as to the grandeur of Londinium under the Roman sway, but it is impossible for it to cheat us into the idea of the city's presenting any signs of grandeur in after-times, for under both its Anglo-Saxon and Norman sovereigns it must have been, as we shall presently see, in a most wretched condition, and its inhabitants subjected to what would now be considered intolerable nuisances and inconveniences. Londinium was most probably a British town, that is, a large enclosure protected by a rampart and fosse, previous to the invasion of the island by Cæsar, in whose time a considerable traffic was carried on between the Britons and the Gauls. But though Cæsar crossed the Thames, he makes no mention of Londinium. The first notice of it occurs in Tacitus (*Ann.*, xiv. 33), where it is spoken of as not then honoured with the name of a colonia, but still as a place much frequented by merchants and as a great depôt of merchandise. In the revolt of Boadicea (A.D. 62) Suetonius, the Roman commander, abandoned Londinium to the enemy, who massacred all the inhabitants who did not leave it with Suetonius; a circumstance which leads us to infer that it was then chiefly occupied as a Roman station. If any conclusion can be drawn from the brief notice of Tacitus, London was then incapable of making any defence, and had probably no wall that could resist the enemy; though that historian mentions the want of soldiers as the cause of its being abandoned by Suetonius. It does not appear from Tacitus whether the place was then destroyed by the Britons. At a later date London appears to have been made a colonia under the name of Augusta (Amm. Marcell., xxvii. 8.) The antient wall of London, ascribed to Theodosius, governor of Britain, began at a fort near the present site of the Tower, and continued along the Minories, to Cripplegate, Newgate, and Ludgate. The walls are said to have enclosed an area of somewhat more than three miles in circumference, and to have been guarded by fifteen towers, which latter are conjectured to have been 40 feet high, and the walls 22. The prætorium and its adjuncts are supposed to have occupied the site of the Poultry and Cornhill, as tesselated pavements have been discovered there and at the Lothbury gate of the Bank, and near St. Mary's Woolnoth.

In regard to Anglo-Saxon London, our information is as scanty as it is with respect to the Roman city; but we may easily conceive that it must have greatly fallen off in appearance during the barbarous period that succeeded the final departure of the Romans from the island, when it was alternately attacked and ravaged by the Picts and Scots, by the Saxons and Angles. In the sixth century it became the capital of the Anglo-Saxon kingdom of Essex, and in the following was a bishop's see. Sebert, king of Essex, having been converted to Christianity, erected a cathedral church to St. Paul, and an abbey church to St. Peter, on the sites of the present cathedral and Westminster Abbey. All however that we know of London, till for many centuries afterwards, extends no further than a few sites and names, the memory of which has been preserved, notwithstanding the successive changes to which the places themselves have been subjected. At this period and for long after, the city could have been little more than an assemblage of hovels, intersected by narrow miry lanes, the whole enclosed by walls, except on the side towards the river. It was on the banks of the river, in Castle Baynard Ward, and on the south side of the present cathedral, that the residence of the Anglo-Saxon kings stood, erected either by Alfred, Edward, or Athelstan; most probably by the last, whose name is retained in that of Adel or Addle Hill. This Anglo-Saxon palace was forsaken by Edward the Confessor, who removed to that which he had erected at Westminster; after which, together with the cathedral, the first-mentioned building was destroyed by fire in 1087. The Tower Royal (at the end of the street so called) was another palace, erected after the Norman conquest, but its origin cannot be traced. In Richard II.'s time it was called the Royal Wardrobe, and was granted by Richard III. to the first duke of Norfolk.

Of public buildings there were scarcely any besides religious houses and hospitals, both which were very numerous previous to the Reformation, and of several of them the names are retained at the present day, viz. Black Friars, White Friars, Crutched Friars, Chartreux (the Charterhouse); *Priories*—St. John of Jerusalem, Clerkenwell (St. John's Gate), St. Bartholomew the Great, St. Mary Overies, Southwark; *Nunneries*—St. Helen's, Bishopsgate Street, and Holywell, in Holywell Lane, Shoreditch; *Hospitals*—St. Giles's, St. James's (the Palace), St. Katherine's, and St. Thomas's. What few residences there were of any note were scattered about, and mingled with the meanest habitations: that of Henry, earl of Northumberland in the time of Henry VI., stood in Fenchurch Street; Crosby House (1470, a portion of which still remains, and has lately been restored), in Bishopsgate Street. Oxford Place, the residence of the Veres, earls of Oxford (1592), was in St. Swithin's Lane, where were the houses of Sir Richard Empson and Dudley, the notorious agents of Henry VII.; and that of Cromwell, earl of Essex, stood in Throgmorton Street, while at a later period Aldersgate Street and other places now abandoned to shops, counting-houses, and warehouses, were inhabited by the noble and the opulent. The antient residence of the bishops of London was in Aldersgate-street.

As to the actual appearance and condition of the metropolis we have little more than conjectural and piecemeal information until we come down to times that may comparatively be termed recent; for contemporary chroniclers and topographers seem to have had no regard to the curiosity of posterity; but contented themselves with noting, whether briefly or prolixly, most drily, what they beheld, without aiming at anything like a graphic description of the whole. We may however easily picture to ourselves what London must have been even in the first half of the sixteenth century, when the act for improving and paving the city, passed in 1532, describes the streets as 'very foul and full of pits and sloughs, very perilous and noyous as well for all the king's subjects on horseback as on foot, with carriages.' If to the formidable inconveniences to which passengers and traffic were subjected, we add those of narrow crooked streets, gloomy by day and left in total darkness at night, we shall be forced to add a few shades more to the picture of the [illegible] condition of the citizens. Perhaps even the vilest bye-lanes, alleys, and courts that are now to be met with, are, except in regard to the houses themselves and their inhabitants, hardly a degree worse than was the London 'of olden times' generally. No wonder therefore that pestilence and fire should at various times have committed such havoc, the population being densely cooped up in confined and badly ventilated dwellings, constructed for the greater part of plaster and timber, covered with thatched roofs, and having each story overhanging that immediately beneath it. While this last-mentioned circumstance must have contributed not a little to unhealthiness by leaving very little space between the uppermost stories of the opposite houses, it must also have rendered fires particularly destructive, so that what with the denseness of the buildings, the combustibility of their materials, and an insufficient supply of water, the breaking out of a fire must have threatened a conflagration of a whole neighbourhood, as is still the case at Constantinople. At the present day such a conflagration as that of the great fire of 1666 would be almost impossible, even if no efforts were made to arrest its progress.

Though churches, religious houses, and some few private residences may have been substantially built, and perhaps entitled to the epithet of magnificent, especially when compared with the ordinary dwellings, they must have been altogether insufficient to counteract the general rude and mean appearance of the city. Whatever degree of comfort or even luxury there may have been in the abodes of a few great nobles, there can be no doubt that the people generally, even including the wealthier burghers, were miserably lodged and housed. The exceptions from it are not to be mistaken for the rule itself; and if we contrast the condition of society class by class, we find that, setting aside the very highest, by whom greater state was affected than at present, all the rest will bear no comparison with the corresponding ones of modern times as regards the comforts of life. Many things which were formerly the luxuries of the few have since become the every-day necessaries of the many; to say nothing of the numerous conveniences and enjoyments now placed within the reach of nearly all, though, a century or two ago, no wealth could procure them. The pictures given us by Erasmus and Holinshed of the manners and domestic economy of our ancestors, so far from being at all flattering, portray a state of semi-barbarism; so that whatever occasion there may have been for regulating attire and restraining luxury in dress, there was no need of sumptuary laws to check excess of refinement in houses and furniture. In the early part of the fifteenth century even 'the uplandish towns in the realm' could not boast of more than three or four chimneys; and afterwards the houses of the English were described by the foreigners who came over with Philip II. as consisting of walls built with 'sticks and dirt.' In the metropolis the generality of the houses may have been a degree better; yet Holinshed himself admits that London had a very mean appearance in comparison with most foreign cities. During the sixteenth century however it greatly extended itself westward along the north bank of the river, where many of the nobility erected 'fayre and statelie' mansions, of which Northumberland House is the only one remaining, no traces of the others being left, although the names of several of them are still retained in the streets opening into the Strand. Even Exeter 'Change, which occupied the site of Exeter House, originally built by the great Lord Burleigh, has in its turn disappeared, and transmitted its name to the present Exeter Hall. Still greatly as the metropolis had increased in extent in the reign of Elizabeth, the map of it at that period (a cut of which may be seen in the 'Penny Magazine,' No. 427), shows it to have been a mere dwarf in comparison with its present gigantic dimensions: all to the north and west of the Strand was open fields and country, as well as nearly all the south bank of the river, now a populous and extensive district, and connected with the northern side by several bridges, whereas before the erection of Westminster Bridge (commenced 1739), London Bridge was the only structure of its kind which the metropolis possessed. Insignificant as the increase of buildings in Elizabeth's reign may now appear, it was regarded with so much apprehension as well as wonder at the time, that the queen issued a proclamation in 1580, forbidding the erection of any but houses of the highest class within three miles of the city. The same was done by her successor, but in neither case had the prohibition much effect; so that by 1666 many new districts and parishes had been added to the suburbs. Terrible as was the calamity which during that year befel the city itself, when upwards of 13,000 houses and other buildings, including St. Paul's cathedral and the portico added to it by Inigo Jones, fell a prey to the flames, it has been attended with much benefit. 'Heaven be praised,' exclaims Malcolm, 'Old London was burnt!' and indeed what is chiefly to be regretted now is that advantage was not taken of the opportunity then afforded of laying out the streets with greater regard to regularity and convenience. for that purpose was made by Sir Christopher Wren, other by Sir John Evelyn. If either of them had been carried into execution, the City would have been infinitely more commodious for traffic than it now is, notwithstanding the very material improvements which have taken place within the few last years, by opening a communication from New London Bridge to the Mansion House and Bank, and thence northwards to Finsbury Circus. According to Wren's plan there would have been two principal streets carried in a direct line, one from Aldgate, the other from the Tower, intersecting in their course one or two open polygonal areas or piazzas (from which other streets would have branched off), and terminating in a larger triangular piazza, in which St. Paul's would have been placed, and from which another street would have been carried in a straight course to Temple Bar. Evelyn's plan also provided for several piazzas of various forms, one of which would have been an oval with St. Paul's in the centre of it; but it differed from the other in proposing a street in a line from St. Dunstan's in the East to the cathedral, and then straight onwards to Temple Bar; but this plan did not, like Wren's, contemplate a continued quay or terrace along the river. Unfortunately the singular obstinacy and narrow-mindedness of the citizens set them both aside: the extraordinary opportunity for improvement which then presented itself was entirely thrown away, and instead of being in any respect calculated to show that noble pile to advantage, the area in which St. Paul's stands is as irregular and unarchitectural as it is inconvenient.

Within the course of the next hundred years from this date the metropolis extended itself considerably to the west and north-west, where it became more fashionable to reside; and no doubt the fire of London had a great share in this change, for their mansions in the city having been destroyed by it, the nobility removed from that seat of bustle and traffic much earlier than they otherwise might have done. Both Soho Square and Golden Square (now places of very inferior rank to the more modern ones) were built before the close of the seventeenth century; while Hanover and Cavendish Squares appear to have been erected between the years 1716 and 1720. In the reign of George II. arose three churches, each of which is distinguished by a noble Corinthian portico, viz. St. George's, Bloomsbury (consecrated 1731); St. Martin's, and St. George's, Hanover Square (1742). The first of these however has not obtained a reputation equal to that of the second, notwithstanding that it ought to place the name of Hawksmoor at least on a level with that of Gibbs. [HAWKSMOOR; GIBBS.] In 1700 Old Bond Street was partly built, but its situation was then almost rural, all to the north being fields, lanes, and uncovered ground; and many mansions which are now surrounded by buildings and streets for a considerable distance, then stood, if not quite solitary, with only a few straggling houses in their neighbourhood; such was the case with Montague House, now the British Museum, and Burlington House, Piccadilly.

Notwithstanding however that other squares and streets continued to be progressively formed, until the district on the north of Piccadilly assumed a connected town-like appearance, neither that nor any other part of the metropolis bore much resemblance, in character and aspect, to what it now does, the houses having been all, if not rebuilt, more or less modernized since that time. As one instance of this, we may observe that no one would be able to recognise St. James's Street as shown in one of the plates of Hogarth's Rake's Progress, were it not for the gateway of the palace, the only feature that remains unaltered. The town might have gone on increasing to its present bulk; yet unless improvement had kept pace with its growth, it would have been far different from what it actually is; and we should at this day have had to contend with all the inconveniences described by Gay in his 'Trivia, or Art of Walking the Streets,' which appear to have been formidable enough, both in rainy weather and after nightfall.

It was not till the beginning of the reign of George III., when the present system of paving and lighting the streets was introduced, that the metropolis began to put on a civilised appearance, by the safety and convenience of the public being attended to. Signs, posts, waterspouts, and all similar nuisances and obstructions were removed; foot-paths were laid down, and lamps were lit at night. It is true the foot-pavements were exceedingly scanty, and the oil-lamps diffused a light just as scanty—certainly not brilliant enough to extinguish all at once both flambeaux and link-boys. With the exception of this very important and provement, and the increase of building, little advance was made in the architecture of the metropolis during the latter part of the last century. Almost the only public edifices of that time at all entitled to the epithet of magnificent were Somerset House and the Bank; which latter however may with equal propriety be considered as belonging to the present century, since it was not completed as at present till about 1825. The Adams indeed erected the Adelphi, Portland and Stratford Places and two sides of Fitzroy Square; yet these can scarcely be considered as public works, and as specimens of street architecture are (at least the first-mentioned) of exceedingly questionable taste, although they may fairly be allowed to be handsome in their general air and appearance. The Adams however are entitled to the praise of having improved the general style of ordinary house-building, and of having substituted convenience, cheerfulness, and lightness for the incommodiousness and heavy taste which formerly prevailed. The Pantheon, in *Oxford Street*, by James Wyatt, ought perhaps to be mentioned as a piece of architecture of some note, belonging to the latter half of the last century; but it no longer exists, save in name alone, being now totally altered, except some portion of the façade, which in itself displays no very great taste, and has not sufficient size to give it importance, while the interior is now converted to a very different purpose from its original one. As buildings, none of the theatres can be dated farther back than the present century, at the commencement of which, or about 1800, we may observe that Russell Square (the nucleus of a cluster of other squares that have risen up in its immediate neighbourhood) was first formed. Covent-Garden Theatre, the first production of Sir R. Smirke, and almost the first specimen of the Grecian Doric style in the metropolis, may also be considered as the beginning of a new era in its architecture; or rather it has so happened that it has been followed by numerous other structures and improvements, which have given (at least as far as they extend) quite a different aspect to the town.

Whatever they may be in regard to architectural taste, or however objectionable when examined in detail, it cannot be denied that both Regent Street and the Regent's Park were magnificent improvements, and have, moreover, led to a variety of others. They have certainly created a taste for a degree of architectural display that would formerly have been considered quite prodigal; and if that taste be in many instances very bad—not to say paltry,—it is upon the whole preferable to the dull monotony that used, as far as their architecture was concerned, to characterize even the best of the trading streets in the metropolis. The *Strand* affords a very fair comparison between the old and new modes of building, the houses being of the same class, though very different in architectural character; and as even the most prejudiced can scarcely hesitate to decide in favour of the latter, it may be almost taken for granted, not only that attention to appearance is more studied than it used to be, but that the condition of shopkeepers and tradesmen is improving likewise. The alterations occasioned by the building of New London Bridge, and forming approaches to it, in consequence of the change of site, have already greatly metamorphosed that part of the city, and awakened a spirit of improvement which bids fair to keep pace with that at the other end of the town. As to King William Street, much cannot be said in praise of the façades which it exhibits. The new range of buildings in Princes Street, at that extremity of it which was previously a most inconveniently narrow lane, has, on the contrary, a somewhat imposing air of noble simplicity. Moorgate Street too, which extends from the one just mentioned to Finsbury Circus, is decidedly better than that near the bridge. While it displays a pleasing regularity of design and uniformity of character, it does not offend by too great sameness and monotony, the elevations being broken into sufficiently distinct masses; besides which the houses have an air of greater loftiness than usual, owing to the breadth of the street not exceeding their height. When the Royal Exchange (destroyed by fire on the night of Jan. 10th, 1838) shall come to be rebuilt, it will no doubt lead to various other improvements in its immediate vicinity. In addition to this, it is in contemplation to form new streets where at present either no public thoroughfares exist or only such as are very crooked and narrow. Among these is one from the Post-Office to Lothbury and the Bank; another in continuation of Farringdon Street northwards; a third to open a direct communication between Holborn and the Strand, along the east side of Lincoln's Inn Fields. A similar project is now going on for improving the neighbourhood of Westminster, by means of a spacious street intended to lead from the west front of the Abbey to Pimlico. The necessity not only for these but for other improvements of the same kind must be tolerably apparent to any one who looks at a map of London; and among them would be a direct line of communication from the upper end of St. Martin's Lane into Oxford Street; another from Coventry Street into Covent Garden Market; and a third from Holborn into the Strand, to be obtained by widening and rebuilding the whole of Drury Lane.

With the exception of the terraces in the Regent's Park, Hyde Park Terrace near Bayswater, and that in St. James's Park—which are for the greater part more tawdry than rich in point of design,—none of the newer ranges of private houses make any pretension to architectural decoration; or if any thing of the kind be occasionally attempted, as in Eaton Square, &c., it is so meagre in itself and so grudgingly bestowed, as to be quite the reverse of satisfactory. Internally however the houses themselves are, in proportion to their size, far more commodious and better fitted up than those of half a century ago. All the newer parts of the town are likewise sufficiently airy and cheerful, owing both to the greater width of the streets themselves, and to the greater breadth of the foot-pavements and the areas before the houses; while, for the last reason, the kitchens are less gloomy and the foot-pavements less muddy than in the older and narrower streets. Besides this, another advantage is that the inhabitants are less exposed to the observation of their opposite neighbours; while the system of macadamization, now so generally adopted in squares and streets, has very much abated the nuisance of the rattling of carriages. In fact, as regards the laying out, paving, and lighting of the streets, there is very little room for further improvement: there is however one serious inconvenience attending some of the widest streets which are frequented thoroughfares—the width of the carriage-way being so great as to render it hazardous to cross them when filled with carriages. This is particularly the case in Regent Street; yet the remedy for it is easy, as all danger and inconvenience to foot-passengers would be removed by erecting a lamp-post, with a few other posts around, at one or two crossings; besides which the roadway of the crossing would then be sufficiently lighted at night. In addition to the more obvious improvements as regards paving, lighting, the widening of streets, and removal of all obstructions in them, it should be mentioned that the salubrity of the metropolis has been greatly increased both by the supply of water and the present effectual system of drainage and sewerage.

Public convenience has been better consulted than it used to be by the erection of more commodious markets, in respect to which London was till lately not so well provided as Liverpool. Although not much of an architectural improvement, the present Covent-Garden Market is far more comfortable and commodious than the old one; and both Hungerford and Farringdon Markets (the former more especially) exhibit a most welcome change from the condition of their predecessors. The wonder lies not so much in the change itself, as that it should not have taken place sooner, shelter being almost indispensable for all such places in a climate so humid and rainy as ours, and which, if not kept dry, can hardly ever be kept clean. Of covered streets of shops we have as yet but two, namely, the Burlington and Lowther Arcades; unless we choose, as far as foot-passengers are concerned, to include also the colonnades of the Quadrant in Regent Street and the Opera House. The Lowther Arcade is of exceedingly handsome and tasteful design, and may be termed even luxurious in comparison with some of the narrow alleys and lanes with shops in the city, where however the example thus set has not been adopted. Somewhat akin to these arcades, or *passages*, as the French term them, are the bazaars which have of late years become so common, though formerly Exeter 'Change was the only place of the kind, and one moreover of most homely and mean appearance, compared with the highly decorated one of the Pantheon in Oxford Street. The Pantechnicon, near Belgrave Square, is another very extensive establishment of a similar though not precisely the same kind.

Although, in comparison with many other capitals, London is by no means rich in public collections of works of art, some advancement has of late been made even in this respect, both by the establishment of the National Gallery and the unreserved access now afforded to the British Museum, whose collections have been greatly increased in the present century. The Soanean Museum can as yet hardly be said to be open to the public. An effort has been made to have both Westminster Abbey and St. Paul's opened to visitors gratuitously; but it has hitherto been unsuccessful. In the meanwhile annual exhibitions are increasing: formerly there was only that of the Royal Academy; whereas there are now two at the British Institution, one for modern pictures, the other for works of the old masters; and that of the Society of British Artists, besides one or two of paintings in water-colours. To these may be added various other exhibitions of more or less recent origin, as dioramas, panoramas, &c. Formerly the 'lions' in the Tower and the animals at Exeter 'Change used to be far famed among the sights of London; but in lieu of them we have now the Zoological Gardens at the Regent's Park and the Surrey Zoological Gardens. In the course of a few years the Regent's Park will most probably possess another novel and attractive exhibition, it being intended to convert the whole of the inner circle into a botanic garden, with buildings and other ornamental accessories; and the mention of this reminds us that St. James's Park has been altered greatly for the better, it now presenting, instead of a mere meadow and formal canal, the appearance of a well laid-out pleasure-ground, with a lake studded by islets. The Adelaide Gallery, Lowther Arcade, and the Polytechnic Institute, Regent-street (opened August, 1838), afford proof of the diffusion of knowledge. The same remark applies to the various literary and scientific institutions, of which there is now some one or other in almost every quarter of the metropolis. Another class of establishments which, as now organized, may be said to be peculiar to our own times, are the club-houses, principally at the west-end of the town, which in some degree partake of the nature of places of literary as well as convivial meeting. Some of them are not only splendidly fitted-up and afford the most luxurious accommodation within, but are very conspicuous architectural objects. When the Reform Club is finished, the south side of Pall-Mall will consist almost wholly of these palace-like edifices, whose façades offer such a contrast to that homeliness of exterior which, with here and there an exception, prevails among what are internally splendid private mansions.

One innovation of very recent date, though long before demanded by a regard to public health, is the formation of cemeteries beyond the suburbs. Some years before anything of the kind was actually adopted, a scheme was brought forward for one to the north of the Regent's Park, but it failed probably from its having been on too gigantic and expensive a scale; for that necropolis was to have been a sort of mimic Athens, with facsimiles of all its temples and other buildings. The idea itself however was taken up by other parties, and the Kelsall Green Cemetery was formed about 1832. There are now two more; one at Highgate, the other at Norwood, both of which were executed chiefly in 1838, and a fourth and fifth are about to be undertaken at Brompton and Newington Butts.

Having thus far given a summary account of the growth of the metropolis, and of some of the principal changes occasioned by the increase of wealth, we should proceed to give some description of the more important public buildings; yet, unless we were to confine ourselves to merely one or two, which, as being the most noted, have already been described by others again and again, we should very greatly exceed all reasonable limits. We therefore adopt the more novel and convenient mode of exhibiting, in a tabular form and in chronological order, a list of such public buildings as are most worthy of notice on account of their architecture. This will at all events furnish a synoptical view of our metropolitan architecture, and were similar tables drawn up of the principal buildings of other capitals and cities, including some of our own large provincial towns, more exact information of the kind might be comprised in a few leaves than can otherwise be obtained by turning over a vast number of volumes. We shall however here prefix to the table itself a few general remarks on some of those buildings and others, more satisfactory perhaps than the very brief comments there inserted.

lder architecture the metropolis now exhibits very ith the exception of parts of the Tower, the Temple Church, Westminster Abbey and Hall, and one or two churches, such as St. Bartholomew the Great, and St. Mary Overies, at the south end of London Bridge, which was ably restored a few years ago. Other specimens that had been spared by fire have been swept away by improvement; among the rest the Savoy Palace and Ely House. But if improvement has in this respect been as merciless as fire, and, in the opinion of antiquaries, perhaps no less mischievous, it has at least cleared away the mass of unsightly buildings which formerly blocked it up the noble abbey of Westminster and the magnificent chapel of Henry VII. attached to it, both of them among the finest specimens of their respective styles. Wren's work however, in the western towers of the abbey, shows him to have had no feeling for Gothic architecture, which style did not begin to be revived in the metropolis until the present century. As the architect of St. Paul's, Wren is justly entitled to the reputation which he enjoys; and that noble edifice has procured for his other works more celebrity than they would otherwise have enjoyed; certainly more than they actually deserve. The greater part of the churches erected by him exhibit a heavy uncouth mannerism, with hardly a redeeming beauty. Even the steeples of Bow Church and St. Bride's have been greatly over-praised: the same remark applies to the interior of St. Stephen's, Walbrook, which derives its claim to elegance solely from its cupola and columns, all the rest being poor and trivial even to meanness. The few civic buildings which he erected were not in a more refined taste; nor would such structures as the former Fishmongers' Hall and Custom House, the old College of Physicians (now converted into a butchers' market), and Temple Bar, add to the reputation of any architect of the present day.

In the next age a different mode of design began to be adopted for churches, and those of St. George's, Hanover-square, St. Martin's, and St. George's, Bloomsbury, which are certainly not otherwise inferior to Wren's, greatly surpass them in the classical dignity which they derive from their porticos. It has indeed hitherto been the fashion—for it can be termed nothing better—wholly to overlook the portico of the last-mentioned edifice, and to decry it on account of the supposed absurdity of its steeple, notwithstanding that, in its outline and architectural expression, that campanile exhibits far greater beauty and propriety than any other we can produce; while the general bad taste displayed in the design of St. Martin's has escaped from reproach on account of its portico alone. How far the architect of the latter was really gifted with taste will be more correctly judged by examining his church of St. Mary-le-Strand by Somerset-House (1714-18). As to that of St. Clement's, the steeple of which was also by Gibbs, few will dissent from the opinion passed on it by Malton, who terms it 'a disgusting fabric.'

Besides churches, there are very few public buildings of this period that make much architectural pretension, at least very few now remaining. The former building of the Bank of England, begun in 1734, possessed little beauty or grandeur, though the wings afterwards added by Sir Robert Taylor gave it its present extent of façade. St. Bartholomew's Hospital, commenced by Gibbs in 1730, is a tolerably fair specimen of the average taste of design at that period, which being the case, it is rather surprising that the Mansion House (1739) should have been so severely censured, since, taken altogether, it certainly possesses an air of dignity, and something picturesque in its side elevations. Ironmongers' Hall, Fenchurch-street, begun a few years later (1748), is very far superior in external appearance to any other of the City companies' halls then erected. In the latter half of the century few public buildings were erected, yet among them were two of the noblest which the City even now possesses, namely, the Excise Office and Newgate. The merit of the latter has been universally admitted; the other, on the contrary, is scarcely ever mentioned, notwithstanding that, for imposing grandeur of mass, and greatness of manner combined with simplicity, it surpasses everything else in the metropolis; not so the front of Guildhall by Dance (1789), which is utterly unworthy of the handsome Gothic interior which it masks, being in a most mongrel and vulgarized style, without one single merit to compensate for its absurdities. The small and picturesque front of the adjoining Gothic chapel has now disappeared, it having been taken down some years ago to make room for a building comprising the Bankrupt Courts, &c., a most insipid and builders' design. After the Excise Office and Newgate, Somerset House is almost the only public building which distinguishes the reign of George III.; for all that has been done in the present century may be considered as commencing with the Regency. The end of the last century was however marked by the erection of the East India House, more decidedly Greek than anything which had preceded it. Compared with what it has since been, architecture was then at a rather low ebb; for although one or two of the buildings above mentioned are noble works, they must be taken as exceptions to the meagre, insipid, and monotonous style which stamps this period, and which such erections as the Adelphi and Portland-place rather confirm than contradict. With the exception of St. Peter-le-Poor (1791) and St. Martin's Outwich (1796), not one church was built from the commencement of the reign of George III. to the Regency. The year 1807 is the date from which the metropolitan architecture of the present century may be said to begin. The two Grecian orders Doric and Ionic were for the first time adopted as the standard mode, and insulated columns took place of engaged ones and pilasters. From this time porticos became of as general as they were before of rare application. But in London architectural character has been made to depend too much on such features alone, and even in them the chief study has been bestowed on the columns themselves, nothing whatever of embellishment—not even so much as amounts to consistent finish of the order—being bestowed on their entablatures and pediments. This pseudo-classical style, consisting in merely copying in the latter certain details of antient architecture, has in more than one instance been carried to a most offensive extent; but perhaps the most preposterous of all was the original front of the College of Surgeons, consisting of an Ionic hexastyle attached to a front which, so far from having any architectural pretensions, was in the most vulgar and barbarous taste.

Both the Custom-house and Bethlehem Hospital exhibit in some degree the same perverseness and incongruity, while many other buildings, though more consistent, are nevertheless cold and monotonous, and display nothing more conspicuously than barrenness of invention. Now that the novelty attending Grecian architecture, on its first introduction among us, has passed away, we begin to be sensible of this, and to perceive that little or nothing has been done to naturalize it, or to render it more pliable or more copious than we first found it. Such an avowedly facsimile application of Athenian architecture as St. Pancras was not only excusable but laudable; yet one such specimen of the kind is sufficient; especially when we find that nearly every succeeding one has fallen short of it in regard to finish of details and beauty of execution, though even in St. Pancras the entablature and pediment look chillingly naked in comparison with the columns and the doors within the portico, which latter are in the most exquisite style of decoration. The small façade of St. Mark's, in North Audley Street, forms a rather striking exception from the frigidity and commonplace of Grecian design when reduced to the mere imitation of antient columns. Another pleasing exception is afforded by the New Corn Exchange, Mark Lane, which manifests some happy originality. Of such porticos as that of the College of Physicians, the most that can be said is that they are respectable copies upon a very respectable scale. That of the Post-office (an Ionic hexastyle) is imposing for its size and spaciousness, and is well arranged, owing to its partly receding within the building as well as projecting from it, and to having only a large centre door, with a lower one on each side of it; yet all the rest is rather poor, nor is there much of the genuine expression of the style aimed at. The façade of the University College is a more original and finer composition, besides affording the only instance of a decastyle portico. In the front of the National Gallery the architect of the structure last-mentioned has been by no means so happy; taken by itself the octastyle portico and the ascents to it make a pleasing and rather striking composition, but the cornice is by far too plain and meagre for the rich Corinthian columns, while the dome is positively bad, and altogether different in feeling and character from every other part. In the number of their columns these two porticos (of the University College and National Gallery) exhibit some degree of novelty; but as yet nearly everything of the kind we possess is upon a uniform scale far inferior to that of some of the public buildings at Paris. The only exception, where unusual magnitude has been aimed at, is the Doric Propylæum or Railway Terminus, Euston Square. Here the order displays itself effectively, not only on account of its dimensions, but also because there are no windows nor other features of that kind to interfere with it. The British Fire Office, on the contrary, exhibits a most perverse application of a Grecian Doric to a building which in itself is in the most extravagant and fantastical taste.

Most of the new churches in London and the suburbs professing to be Greek are little better than parodies and travesties of the style. They exhibit moreover a wearisome repetition of the same stale hackneyed ideas, or rather the want of any idea beyond that of tacking a few columns to the front of what would else be mere meeting-houses. These and other spiritless as well as mongrel samples of the Anglo-Grecian school seem at length to have brought the style into disrepute, and accordingly some of the more recent buildings show a desire to return to the Italian, which, if purified and treated with originality instead of servile indiscriminate copying, would in most cases recommend itself in preference to the other. The Travellers' Club-house, particularly the garden front, is a charming and beautifully finished example of the Italian, and its architect (Mr. Barry) has since given a sort of combination of that and Grecian in the new façade of the College of Surgeons. Goldsmiths' Hall is Italian of a more heavily magnificent character, which however is greatly injured by the poverty of the ground-floor and its windows, which is left very bald, notwithstanding that it is comprised within the order. Two buildings erected in 1839, the London and Westminster Bank, and the new synagogue, St. Helen's Place, belong also to the Italian school.

Here we must bring to a conclusion this general summary of the architecture of the metropolis, which it would have been a far easier task to expand than to confine to these limits. We have attempted nothing like either description or detailed criticism, the former of which at least is to be met with in a variety of works. The one more especially devoted to buildings and architecture is the new edition of 'Illustrations of the Public Buildings of London,' by W. H. Leeds. The article 'London,' in Moule's 'English Counties,' will also be found to contain a great deal of information; while in the volumes of the *Companion to the Almanac*, most of the edifices erected within the last six or seven years are described at some length. In regard to detailed criticism, the series of papers in the *Printing Machine*, entitled 'Strictures on Structures,' gives the New Palace, York Column, and various other subjects; and a similar series of architectural critiques on other metropolitan buildings has been commenced in the *Civil Engineer's Journal*.

Table of Public Buildings most worthy of Notice for their Architecture.

Seventeenth Century.

	Time.	Architect.	Remarks.
Whitehall Chapel . . .	1619	Inigo Jones	Chiefly admirable as the first specimen of pure Italian.
York Stairs . . .	1626	Ditto	
St. Paul's, Covent Garden .	1631	Ditto	Tuscan, distyle in antis.
Temple Bar . . .	1670-2	Sir C. Wren	
The Monument . . .	1671-7	Ditto	Fluted Doric column; total height, including pedestal, &c., 202 feet.
St. Stephen's, Walbrook .	1672-9	Ditto	Exterior concealed by houses; interior over-praised chiefly remarkable for its dome.
St. Paul's Cathedral, begun .	1675	Ditto	Extreme length, 500 feet; height to top of cross, 360.

EIGHTEENTH CENTURY.

	Date.	Architect.	Remarks.
St. Paul's finished,	1710		Style Italo-Roman; exterior both magnificent and picturesque, though not faultless.
St. George's, Hanover-square	f. 1724	J. James	Portico hexastyle, Corinthian.
St. Martin's	1721-6	J. Gibbs	Portico hexastyle, Corinthian; the general style bad.
St. George's, Bloomsbury	f. 1731	Hawksmoor	Ditto, ditto; Campanile excellent.
Mansion House	1739-53	Dance	
Westminster Bridge	1739-50	Labelye	Length 1066 feet.
Ironmongers' Hall	1748	Holden	Italian Ionic on basement.
Horse Guards	1751	W. Kent	
Blackfriars Bridge	1760-70	R. Mylne	Length 1000 feet.
Excise Office	1769	James Gandon	Plain in design, but of most commanding aspect.
Adelphi	1770	Adams	
Newgate	1770-82	Dance	Admirable in design and character.
Somerset House	1776	Sir W. Chambers	Though poor in parts, a good example of Italian. River front 590 feet.
Clerkenwell Sessions House	1780	Rogers	East front handsome.
Bank	1789-826	Sir J. Soane	Very picturesque in parts.
India House	1799	R. Jupp	Hexastyle loggia, Grecian Ionic; sculptured frieze and pediment.

NINETEENTH CENTURY.

Covent-Garden Theatre	1808-9	Sir R. Smirke	Grecian Doric; tetrastyle portico.
Drury-Lane Theatre	1811-12	B. Wyatt	
Opera-house, altered	1818	Nash and Repton	
Bethlehem Hospital	1812-15	J. Lewis	Portico hexastyle, Ionic. Length 569 feet.
Waterloo Bridge	1811	J. Rennie	Length 1326 feet.
Mint	1811	Sir R. Smirke	Grecian Doric on a basement.
Custom House	1813	D. Laing	The Long Room and centre of the river front quite altered after the accident in 1826. Length 484 feet.
London Institution	1815-19	W. Brooks	
St. Pancras Church	1819-22	W. & H. W. Inwood	The finest copy of Athenian Ionic.
Post-Office	1823-9	Sir R. Smirke	Hexastyle, Ionic portico; extent of front 390 feet.
Hanover Chapel, Regent-street	1823-5	R. C. Cockerell	Tetrastyle Ionic portico.
British Museum (new buildings)		Sir R. Smirke	
Buckingham Palace	1825	Nash and Blore	
College of Physicians and Union Club-House	1825-7	Sir R. Smirke	Grecian Ionic.
Board of Trade	1824-6	Sir J. Soane	Roman Corinthian.
Colosseum	1824	D. Burton	Hexastyle, Grecian Doric portico attached to a polygon 130 feet diameter.
London Bridge	1825-31	J. Rennie	Length 920 feet.
St. Mark's, North Audley-st.	1825-8	Gandy-Deering	Florid Grecian Ionic; façade small, but of rich design.
St. Katherine's Hospital	1826	Poynter	Chapel Gothic; the rest Old English Domestic.
Hall, Christ Church Hospital	1826	J. Shaw	Later Gothic.
Scotch Church, Regent-square	1827-8	W. Tite	Gothic.
St. George's Hospital	1827	W. Wilkins	Portico tetrastyle, with square pillars.
London University	1827-9	Ditto	Façade not completed; decastyle portico, and dome.
New Corn Exchange	1827-8	G. Smith	Grecian Doric, with pleasing originality of design.
St. Paul's School	1827	G. Smith	Hexastyle, Tivoli Corinthian on a basement.
Law Institution, Chancery-lane	1827-9	L. Vulliamy	Grecian Ionic hexastyle.
Archway, Green Park	1828	D. Burton	
Fishmongers' Hall	1827-34	H. Roberts	Grecian Ionic.
Athenæum Club	1829	D. Burton	Its bas-relief frieze the only specimen in London.
Goldsmiths' Hall	1829-35	P. Hardwick	Italian; magnificent, yet somewhat heavy, and basement poor.
Exeter Hall	1830-1	Gandy-Deering	Greco-Corinthian, distyle in antis.
St. Dunstan's in the West	1830-32	J. Shaw	Gothic; handsome Louvre tower.
York Column	1830-36	B. Wyatt	Total height, including statue, 137 ft. 9 in.
Lowther Arcade	1830	J. Turner	Greco-Italian, with pendentive domes.
Hungerford Market	1831-3	C. Fowler	
Travellers' Club	1831	C. Barry	Choice specimen of the best Italian style, particularly the design of garden front.
Charing-Cross Hospital	1830-1	D. Burton	
St. George's, Woburn-square	1832	L. Vulliamy	Gothic; handsome spire.
Westminster Hospital	1832	Inwoods	Modernized Gothic.
National Gallery	1832-7	W. Wilkins	Grecian; total extent of front 458 feet.
State-Paper Office, St. James's Park	1833	Sir J. Soane	One of his chastest productions. Style, Italian.
Pantheon Bazaar	1834	S. Smirke	
School for Indigent Blind	1834-7	J. Newman	Style Tudor, white brick and stone; central tower of rich design.
St. Olave's School	1835	J. Field	Style Elizabethan, red brick and stone.
College of Surgeons	1835-6	C. Barry	Italianized Grecian.
United University Club	1836-7	Sir R. & S. Smirke	Style a modified Italian; bas-relief panels.
St. James's Theatre	1836	S. Beazley	
Railway Terminus, Euston-sq.	1837-8	P. Hardwick	A Grecian Doric propylæum on an imposing scale.
London and Westminster Bank	1887-8	Cockerell and Tite	Style modified Italian; singular but pleasing.
Synagogue, Great St. Helen's	1837-8	J. Davies	Style Italian; interior rich and tasteful.
Reform Club	1838	C. Barry	Italian.

Divisions.—The City of London is divided, for ecclesiastical objects and for the management of the poor, into 97 parishes within the walls and 11 without the walls. For municipal purposes the City is divided into 26 wards, each of which in some respects is a separate community. The aldermen and common-councilmen, who are chosen to represent the ward (as hereafter explained) in the City parliament, form likewise a ward council, and they have the control of many of its local affairs. In most of the wards there are subdivisions into precincts, chiefly for the purposes of elections. The division into wards appears to have been made without regard to the parochial divisions, as the different wards consist of divisions of parishes as often as they are coterminous with them. An inquest jury is chosen annually in each ward, whose office it is to make presentments of nuisances and returns of non-freemen, and to perform such other duties as are within the province of a leet jury.

The comparative wealth and importance of each of the 26 wards may be estimated from the following statement of the amount of rental assessed in each for local purposes in 1771, 1801, 1831, and 1838 respectively:—

WARDS.	Amount of Rental.			
	1771.	1801.	1831.	1838.
	£.	£.	£.	£.
1 Aldersgate Within and Without	16,011	17,927	26,460	33,297
2 Aldgate	21,080	24,037	40,912	47,229
3 Bassishaw	4,180	5,776	6,730	6,819
4 Billingsgate	16,651	15,580	19,700	26,776
5 Bishopsgate Within and Without	31,472	37,941	64,260	69,000
6 Bread Street	10,045	11,749	17,842	19,154
7 Bridge	10,220	13,170	15,997	19,032
8 Broad Street	27,000	31,000	47,400	51,363
9 Candlewick	5,404	5,424	11,308	15,097
10 Castle Baynard	15,469	15,807	20,114	29,911
11 Cheap	16,419	18,964	27,400	27,730
12 Coleman Street	11,582	17,081	34,062	34,785
13 Cordwainer	[illegible]	9,286	11,777	11,200
14 Cornhill	1[illegible],107	11,911	19,380	9,387
15 Cripplegate Within	16,000	17,291	20,000	23,386
16 Cripplegate Without	14,175	21,921	30,917	36,091
17 Dowgate	10,111	12,180	13,059	14,497
18 Farringdon Within	29,475	30,077	67,241	35,726
19 Farringdon Without	72,719	81,084	115,912	183,244
20 Langbourn	23,269	25,003	36,082	40,356
21 Lime Street	8,192	6,976	12,444	12,736
22 Portsoken	17,851	19,257	21,807	20,060
23 Queenhithe	8,182	8,962	13,301	13,710
24 Tower	17,180	27,807	41,379	37,407
25 Vintry	9,510	9,210	10,042	14,440
26 Walbrook	9,301	11,075	13,298	17,421
Total	457,701	507,172	752,984	786,736

The corporation of London consists of the whole body of the citizens or freemen, under the style of 'Mayor, Commonalty, and Citizens,' viz.:—

Lord-mayor	1	
Aldermen, in addition to the lord-mayor	25	
Common-councilmen	240	
		266

Officers of the Corporation.

The Sheriffs, who are jointly sheriff of Middlesex.
Recorder.
Town-clerk.
Common-serjeant.
Judge of the Sheriffs' Court and Assistant Judge of the Central Criminal Court.
The four Common Pleaders.
The two Secondaries.
The two Under-sheriffs.
Comptroller of the Chamber.
Remembrancer.
Solicitor and Clerk Comptroller of the Bridge House.
Coroner for London and Southwark.
Clerk of the Peace.
Bailiff of Southwark.
The four Attorneys of the Mayor's Court.
The four Auditors of the City and Bridge House Accounts.
Clerk of the Chamber.
The two Bridge-masters or Wardens.
The three Esquires, and other officers of the lord-mayor's household.
The four Harbour-masters, and other officers connected with the port of London and mooring-chain services.
The Clerks and Assistant Clerks to the lord-mayor and sitting magistrates in London and Southwark.
The Keepers, Ordinary and Chaplains, and Surgeons of the several Prisons of the city.
The Superintendent of Police, the City Marshals, and other officers connected with the police of the city, and sundry officers employed in the civil government of the corporation, collection of its revenue, the markets, &c.

The lord-mayor is elected on the 29th September in each year, from among those aldermen who have served the office of sheriff. Two such aldermen are nominated by the liverymen in common-hall, and of these two, one is selected, usually the senior alderman, by the court of aldermen. He enters upon the duties of his office on the 9th November following: if he refuses to serve, he must pay a fine of a 1000*l.* The lord-mayor elect must be presented to the lord chancellor, who signifies the assent of the crown to his election. He must also be presented, on the day on which he enters on his office, to the barons of the exchequer, when he takes the oath of office. The salary and allowances paid to him from the city funds during his year of office amount to 6422*l.* 8*s.* 4*d.*, in addition to which he receives sums from various sources which raise the official income to about 7900*l.* The expenses, chiefly arising from a sumptuous hospitality, usually exceed the income by about 4000*l.* He resides during the year of office in the Mansion-house, which is handsomely furnished, and provided with plate and jewelled ornaments said to be worth from 20,000*l.* to 30,000*l.* The functions of the lord-mayor are multifarious. A great part of his time is occupied by magisterial duties. He presides over the courts of aldermen, common-council, and common-hall. He is conservator of the Thames, and holds eight courts during the year of office, two for each of the counties of Middlesex, Surrey, Essex, and Kent, 'to inquire into all offences to the destruction of the fish, nuisances upon and impediments of the common passage of the Thames and Medway.' He presides as judge in the Court of Hustings, the supreme court of record in London, which court is generally held once a week, whence it is frequently resorted to for obtaining judgments in cases (as of outlawry) where expedition is required. He is first commissioner of the Central Criminal Court, and usually opens the sessions in person. He is a justice of gaol delivery for Newgate, and is named in every commission for that purpose. He usually opens the London session in person. He also opens and presides at the sessions in Southwark. He is escheator in London and Southwark. He is also admiral of the port of London, and is at the head of the lieutenancy of the city of London. He is properly clerk of the markets and gauger for the city. On the demise of the crown he is always summoned to attend the privy-council which declares allegiance to the successor. At the coronation, the lord-mayor acts as chief butler, and receives for his fee a gold cup.

The aldermen are elected for life, at meetings of the ward, called a wardmote, which must take place within 14 days after each vacancy shall occur. The electors are such householders of the ward as are freemen of the city and pay local taxes to the amount of 30*s.* per annum. A person refusing to serve the office when elected may be fined 500*l.*, but is excused on swearing that he is not worth 30,000*l.* With the exception of the alderman of the Ward of the Bridge (always the senior alderman, and who has no local duties to perform), every alderman appoints a deputy from among the common-councilmen of the ward. Every alderman is a justice of the peace for the city of London, and one of them attends, by a rotation among the body, for a week at one time in the justice-room at the Guildhall, for the transaction of magisterial business. In cases where two magistrates are required to determine any case at the Mansion-house, this sitting alderman proceeds there, and joins the lord-mayor for the purpose.

The common-councilmen are elected annually on St. Thomas's day, at a wardmote, the electors being the same as in the elections of aldermen. The number elected varies in the different wards, but not in proportion to their extent and presumed importance, the smallest number in any ward being 4, and the greatest 17. Any qualified freeman householder, when elected, would be subject to fine and disfranchisement for not serving, but such cases seldom or never occur. The common-councilmen do not meet in any court exclusively their own, their sittings being always under the presidence of the lord-mayor and attended of right by the aldermen. The title of the court of common-council is 'the Lord Mayor

Aldermen, and Commons of the city of London in Common Council assembled.' To constitute a court there must be present the lord-mayor or some alderman, his locum tenens, two other aldermen at least, and as many common councilmen as, with the lord-mayor and aldermen present, shall make up the number of 40. The senior law-officers of the city have seats in the court, but have no vote, and do not speak unless called upon to do so. Of late years the public have been allowed to attend, but must be excluded upon the motion of any member of the court. There are usually about 12 ordinary meetings of the court in the year. The lord-mayor may at any time call the members together, and on a requisition from a moderate number of members he seldom fails to do so. This court has now unlimited power of applying the funds of the corporation, and full legislative authority in all municipal matters, where not restrained by statute. The members of the court are severally nominated members of various committees, and thus perform various executive functions. The common seal of the city cannot be applied to any instrument but by order of the court of common-council, which thus reserves power over the disposition of the landed property belonging to the corporation.

The two sheriffs are chosen annually by such of the freemen as are liverymen of some one of the city companies. Every alderman who has not served the office is put in nomination as a matter of course. The lord-mayor, between the 1st of April and the 14th June, may put in nomination any number of freemen not exceeding nine. Any person thus nominated remains on the list until he is elected or has paid the fine of 400*l.* and 20 marks for not serving the office; and on the day of election, Midsummer-day, any two electors may put any freeman in nomination. No person is liable to serve the office twice.

The sheriffs attend the lord-mayor on state occasions and at every court of aldermen. They present the petitions of the court of aldermen or common-council to the House of Commons at the bar of the House. In the cases of addresses to the crown they attend at court for the purpose of learning when the address will be received. They attend the common-hall at elections to take the votes. They are the returning officers of the members of the House of Commons for the city of London and the county of Middlesex. Either the sheriffs or the under-sheriff of Middlesex attend at the execution of capital sentences within the city. They have the superintendence of prisons within the city, and present reports concerning their state at every court of aldermen. The sheriffs receive between them a payment from the city of 737*l.* 6*s.* 8*d.*, and they have a few incidental emoluments which one year with another raise the income to 1000*l.* for the two. On the other hand, the state which they are expected to maintain and the entertainment of the judges and aldermen who attend the Central Criminal Court at the Old Bailey subject them to very heavy expenses, amounting for each sheriff to about 2000*l.* beyond the receipts. The shrievalty being vested in the citizens of London, some of its most important duties are assigned to the judge of the sheriffs' court, and the secondaries, who are elected by the common-council.

The recorder is elected for life by the court of aldermen. He must be a freeman, but the grant of freedom may immediately precede the election. The recorder has always been chosen from among barristers. The duties of recorder are those of an advocate and adviser of the corporation. He is advised with on all cases relating to the affairs of the city, and holds a brief for the corporation in all cases, except in the courts where he himself presides. When the city is heard by council before either House of Parliament, the recorder argues the case. He is by charter a justice of the peace and commissioner of the Central Criminal Court, and a justice of the peace in Southwark. The recorder attends the lord-mayor on all important occasions of state ceremony. He sits with the judges of the court of hustings to direct them in points of law and to give judgment. The recorder acts as one of the judges at the twelve sessions holden annually in the Old Bailey, and at the conclusion of each prepares a report of the case of every capital convict for the consideration of the privy-council, and he afterwards attends to take the pleasure of the Queen thereupon. He issues warrants for the reprieve or execution of the criminals whose cases have been reported. The annual salary of the recorder is 3000*l.*, in addition to which he receives the ordinary fees on all cases and briefs which come to him from the corporation, and some other trifling emoluments.

The common-sergeant, who has always been a barrister, is elected by the common-council on the nomination of some member of the court. His duties are:—to preside daily in one of the courts of the Old Bailey during the sessions for London and Middlesex, for which purpose he is always named in the commission; he attends all meetings of the livery in common-hall; he attends all courts of aldermen and of common-council unless otherwise engaged in behalf of the corporation; he also attends the lord-mayor on all public occasions; he advises in all law cases relating to the corporation, and acts as counsel for the city in the courts in Westminster Hall. His salary is 1500*l.* per annum, in addition to which he receives fees with all cases and briefs sent to him on behalf of the city, and has some other small emoluments.

The town-clerk is appointed by the common-council, and holds his office by a grant under the common-seal during the pleasure of the court. He is the clerk of all courts holden before the lord-mayor and aldermen; of the mayor's court, of the court of hustings, of the courts of common-council and of common-hall, and of the sessions for conservation of the waters of the Thames and Medway. His duties are exceedingly various; they are such as are incident to the office of a secretary or town-clerk of a corporation, and need not be here detailed. In one year (1833) this officer attended 75 committees of aldermen and 502 committees of the common-council, in addition to his other duties. His emoluments consist of fees on licences, on leases, and on admissions to freedom or to different offices, estimated at 700*l.* per annum for himself, and 100*l.* for his clerks: besides these fees he has a salary of 1300*l* per annum,, and an allowance of 1500*l.* per annum for the expenses of his office. He resides in apartments at the Guildhall, free of rent and taxes.

It is not necessary to enter upon any detail of the nature of other offices held under the corporation. Their duties will generally be sufficiently indicated by their designations

In the City of London there are 89 companies or guilds, eight of which are practically extinct; and one other, that of parish clerks, is not connected with the municipal institutions of the city. Except in cases where the honorary freedom of the City is presented by a formal vote of the corporation, no person could, until recently, become a freeman who had not been admitted into one of these companies; but when by birth, apprenticeship, purchase, or gift, a person has become a member of a company, he has (by virtue of an existing bye-law) an inchoate right to the freedom of the corporation, and is admitted on proving his qualification and on payment of certain fees. Within the last few years however the antient practice has been resumed of admitting to the freedom all resident householders who may apply, by vote of common-council, without being members of any company. Most of the companies possess what is called a livery, that is, a part of their body, under the name of liverymen, if they be freemen of the corporation, enjoy privileges which other freemen do not possess: such as voting for mayor, sheriffs, chamberlain, &c., a right limited to them exclusively by an act of Geo. II. The following list exhibits the names of the companies, stated in their order of precedence. The first twelve are called the Twelve Great Companies. The names in Italics are those of extinct companies:—

1. Mercers
2. Grocers
3 Drapers
4. Fishmongers
5. Goldsmiths
6. Skinners
7. Merchant Tailors
8. Haberdashers
9. Salters
10. Ironmongers
11. Vintners
12. Cloth-workers
13. Dyers
14. Brewers
15. Leather-sellers
16. Pewterers
17. Barbers
18. Cutlers
19. Bakers
20. Wax-chandlers
21. Tallow-chandlers
22. Armourers and Braziers
23. Girdlers
24. Butchers
25. Saddlers
26. Carpenters
27. Cordwainers
28. Painter-stainers
29. Curriers
30. Masons
31. Plumbers
32. Innholders
33. Founders
34. Poulterers
35. Cooks
36. Coopers
37. Bricklayers
38. Bowyers
39. Fletchers
40. Blacksmiths

41. Joiners
42. Weavers
43. Woolmen
44. Scriveners
45. Fruiterers
46. Plasterers
47. Stationers
48. Broderers
49. Upholders
50. Musicians
51. Turners
52. Basket-makers
53. Glaziers
54. Horners
55. Farriers
56. Paviors
57. Loriners
58. Apothecaries
59. Shipwrights
60. Spectacle-makers
61. Clock-makers
62. Glovers
63. Comb-makers
64. Felt-makers
65. Frame-work knitters
66. Silk-throwers
67. *Silkmen*
68. *Pin-makers*
69. Needle-makers
70. *Gardeners*
71. *Soap-makers*
72. Tin-plate workers
73. Wheelwrights
74. Distillers
75. *Hat-band-makers*
76. Patten-makers
77. Glass-sellers
78. Tobacco-pipe-makers
79. Coach and harness makers
80. Gun-makers
81. Wire-drawers
82. *Long bowstring-makers*
83. Playing-card-makers
84. Fan-makers

86. *Starch-makers*
87. *Fishermen*
88. Parish Clerks
89. Carmen

No company on the foregoing list, with the exception of the Carmen, is now exclusively composed of persons from whom it takes its name. The greater part of the Apothecaries' company are in some way connected with the sale of drugs or the practice of medicine; and the greater part of the Stationers' company in the trade connected with the sale of books. The livery was in former times granted only to the more wealthy citizens. An order of the court of aldermen, passed in 1697, directs that 'no person should be allowed to take upon himself the clothing (or livery) of any of the twelve companies,' those which stand at the head of the foregoing list, 'unless he have an estate of 1000*l.*; nor of the inferior companies unless he have an estate of 500*l.*' In more modern times not only has this restriction been relaxed, but it has frequently been made imperative upon many freemen of the City to take up their livery in one of the companies. The terms of admission vary with regard to different companies; but, with some few exceptions, it is open to any freeman to take up the livery of any company upon payment of its regular fees or fines. When the freedom is claimed on the ground of patrimony or servitude, the fines are usually limited to a few pounds; in other cases they vary from a few pounds to 100 guineas. These trading companies may be divided into three classes:—

1. Those which exercise an efficient control over their trade, in which class there are now only two companies, the Goldsmiths and the Apothecaries.

2. Those which have power to search for defective wares, or to prove or mark the article, or to execute any legislative enactment passed for regulating the trade. In this class there are now only the Apothecaries, Stationers, Gunmakers, and Founders, which last has the privilege of testing and marking weights.

3. Those into which persons carrying on certain occupations in the City are compelled to enter, which class includes all not enumerated in the first and second class.

The management of the affairs of these companies is entrusted to certain senior members of the livery, who form what is commonly called 'The Court of Assistants,' and which usually consists of a master, a senior warden, a junior warden, and of an indefinite number of assistants, who succeed in due rotation to the higher offices of the court. Many of the companies possess extensive estates and other property, which is applied in part to the relief of decayed members of their own body and their families, and in part to more general objects of charity. Many of them are also trustees of lands and money, which have been appropriated by the donors to specific charitable objects, and, among such objects, to education. These companies are however no part of the corporation of London, but have many of them their own charters of incorporation.

The City returns four members to the House of Commons. The right of election is in the freemen, being liverymen, and the inhabitant householders occupying dwellings of 10*l.* yearly value. The numbers of electors registered in these two classes in 1832 and 1837 were as follows:—

	1832.	1837.
Number of householders . .	10,322	10,673
Freemen, being liverymen . .	9,134	9,003
Together . .	19,456	19,676

It is probable that some of the above are registered in their double capacity, and thus swell the apparent number of electors. The number that polled at the general election (on which occasion the same individual can appear in one character only) of 1837, which was severely contested, was—

Householders	5,799
Freemen, being liverymen . .	5,778
	11,577

Production.—That London is not commonly considered as a manufacturing town is owing to the more important aspects under which it presents itself, and not because of the absence of manufacturing industry. Manufactures of almost every kind are in fact carried on in the metropolis, and upon a scale of great magnitude; the best workmen in almost every branch of handicraft being certain of finding employment in London at the highest rate of wages. London was for a long time the only seat of the English broad silk manufacture, which is still carried on as extensively as formerly, and perhaps to a greater extent than ever, although Manchester, Macclesfield, and other towns have now become rivals in that branch of industry. Linen, woollen, and cotton fabrics are not made in or about London.

The largest breweries, distilleries, and sugar-refineries in the kingdom are in the metropolis. The manufacture of metals in almost every branch is carried on to a vast extent. It is true that a great part of the hardware and cutlery required for common purposes is made at Birmingham and Sheffield, which likewise supply the greater part of those articles required for exportation, because of the lower prices at which they can be there produced; but when taste or fashion is to be considered, and superiority of quality is desired, the London workmen are commonly employed. Almost every kind of machinery, from the smallest wheels required by the watch-maker to the most powerful steam-engines, are made in London. The making of gold and silver articles, of optical and surgical and other instruments, tools of the best quality, and musical instruments, gives employment to numerous hands. Ship-building, with all its accessories, rope-makers, mast-makers, block-makers, anchor-smiths, &c., has always been actively prosecuted. There are also numerous chemical works on a large scale, tanneries, soap-manufactories, potteries, and dye-houses. Male and female clothing of all descriptions is made, not merely for the use of the inhabitants of the metropolis, but for the supply of wealthy persons in various parts of the kingdom, and even in the British colonies. The metropolis is also the great workshop of literature, science, and the arts. The number of books printed and published in all other parts of England is small in comparison with what is produced in London. The number of men employed as compositors in London is estimated at 2000; there are also 500 apprentices, and 1000 pressmen, in addition to those who superintend the working of the great printing-machines, and whose number has not been ascertained. In the extent to which it has now reached, the mechanical part of the labour of producing books and periodical publications in London may well be considered a manufacture. It has been computed by a bookseller long conversant with one great branch of publication—that of periodical works—that the number of such works sold on the last day of every month in London amounts to half a million of copies, occasioning an expenditure on the part of the public of 25,000*l.*; and that the number of parcels containing periodicals despatched into the country in various directions on that day is 2000. This estimate does not include weekly publications (not newspapers), about fifty in number, of which about ten millions of copies are sold in the course of the year. Of newspapers there are eleven published daily, six in the morning and five in the evening. There are besides twenty-four weekly newspapers, and thirty-eight which appear at other intervals of time, some three times and some twice a week; others on alternate weeks, and one or two monthly. The number of newspaper stamps issued for London publications between 15th September, 1835, and 15th March, 1839, was—

In the year ending 15th of September, 1836 . 19,241,640
" 15th " 1837 . 29,172,797
six months ending 15th March, 1838 . 14,438,556

The number of newspapers despatched from the General Post-Office in London in each of the three years ending 31st of October, 1835-6-7, was as follows:—

	Year ending 31st October, 1835.	1836.	1837.
Sent from the Inland Office .	14,066,406	12,913,878	19,046,411
" Foreign-Office .	158,929	231,819	427,516
" Ship-Letter Office	55,555	66,158	87,537
	14,280,890	13,211,855	19,561,464
Sent through the Twopenny-Post	234,756	242,630	367,942
Total .	14,515,646	13,454,485	19,929,406

The increase in the number of stamps and in the transmission by post during the last year above given, doubtless arises from the reduction of the stamp-duty to which newspapers were liable.

Consumption.—It is not possible to state with any pretensions to accuracy the amount of consumption in London, of any except a very few articles of general use. A considerable part of the foreign and colonial merchandise that passes every year through the custom-house of the port is forwarded into the interior of the country, and the same remark applies, though in a less degree, to the produce of London breweries, distilleries, tanneries, &c. A tolerably good test of the consumption of butchers' meat was formerly supplied by the returns of sheep and cattle sold in Smithfield market, although this would at all times be somewhat below the actual amount, because of the number of animals sold to butchers by the drovers on their road to the market; but of late years, since the improvement of turnpike-roads, and the consequent acceleration of travelling, and more especially since the adoption of steam-navigation, a great and continually increasing quantity of cattle and slaughtered meat is brought for sale to London, of which no account is taken. During all the colder months of the year, from October to April, almost every steam-vessel employed in the coasting-trade to London brings a supply to its markets. Oxen, sheep, and swine slaughtered on Saturday in Edinburgh are by this means brought and exposed to sale on the following Monday, and this branch of business is now followed with activity and regularity from almost every port of the kingdom within 500 miles of the metropolis, which has with it a constant steam communication. Live cattle, sheep, and pigs are brought by the same means during the summer months, and in considerable numbers. With this explanation the following table is offered, showing the average number of sheep and cattle sold in Smithfield market in each quinquennial period from 1730 to 1770, and the actual numbers so sold in each of the years from 1820 to 1838:—

		Sheep.	Cattle.
1730	to 1735	568,060	93,655
1735	1740	599,466	97,548
1740	1745	531,134	85,892
1745	1750	655,516	80,876
1750	1755	680,618	80,843
1755	1760	616,750	91,699
1760	1765	635,247	86,555
1765	1770	632,812	84,244

	Sheep.	Cattle.
1820	947,990	132,933
1821	1,107,230	129,125
1822	1,340,160	142,043
1823	1,264,920	149,552
1824	1,239,720	163,615
1825	1,130,310	156,985
1826	1,270,530	143,460
1827	1,335,100	138,363
1828	1,288,460	147,968
1829	1,240,300	158,313
1830	1,287,070	159,907
1831	1,189,010	148,168
1832	1,257,180	158,640
1833	1,167,820	152,093
1834	1,237,360	162,485
1835	1,381,540	170,325
1836	1,219,510	164,351
1837	1,329,010	172,435
1838	1,403,400	183,362

The following statement of the quantity of wheat and flour brought into the port of London in each year from 1820 to 1838 contains the only information that can be given concerning the consumption of bread in the metropolis, but must not be taken as an accurate test of that fact. In ordinary seasons the great bulk of these importations are retained for the use of the metropolis and surrounding district, but in addition to the quantities thus recorded a great deal of flour is brought by land-carriage from the adjoining counties which does not pass through the books of the custom-house, nor of the clerks of the markets; and on the other hand, in seasons of scarcity, when grain is brought from abroad, much that figures in the returns of the port is afterwards transmitted to other parts of the country. In order to render the following figures as useful as possible in a comparative point of view, notice is added characteristic of each season.

Year ending Michaelmas.	Wheat. Quarters.	Flour. Sacks and Barrels.	Nature of Harvest.
1821	641,371	464,820	Average.
1822	486,484	442,218	
1823	554,351	450,095	Below an average.
1824	394,637	502,390	Average.
1825	354,267	457,231	Not quite an average.
1826	530,961	540,253	Average.
1827	447,677	482,266	
1828	409,042	450,689	Below an average.
1829	423,102	468,293	Average.
1830	1,342,745	484,793	Average.
1831	873,488	475,746	Not quite an average.
1832	908,517	627,003	Full average.
1833	695,902	542,813	
1834	459,222	409,565	
1835	457,448	442,152	Above an average.
1836	429,748	376,775	
1837	465,362	428,431	Below an average.
1838	525,407	515,005	

The following statement of the quantity of coals brought to London in each year, from 1825, will show the consumption of that article with tolerable accuracy. Of late years the greater amount of gas-lighting, the increasing number of steam-engines employed for manufacturing purposes, and still more the supplying of steam-vessels, occasion an increased consumption beyond the quantity used in families; but these circumstances cannot very materially affect the general result.

	Tons.		Tons.
1825	1,956,606	1832	2,139,078
1826	2,040,291	1833	2,010,409
1827	1,888,321	1834	2,078,685
1828	1,960,559	1835	2,298,812
1829	2,018,975	1836	2,398,352
1830	2,079,275	1837	2,626,997
1831	2,045,292	1838	2,581,085

The consumption of coals in London, in 1744, was 596,1[illegible] tons, and in 1795 had reached 1,163,100 tons.

The inhabitants of London draw nearly the whole of their supply of water, for manufacturing and household purposes, from the Thames and what is called the New River. [HERTFORDSHIRE, p. 179.] The daily consumption is stated by the directors of the principal companies (eight in number) by which it is distributed, to amount to 20,829,[illegible] imperial gallons. Of this quantity, the north-western district receives 9,000,727 gallons, the north-eastern 7,694,[illegible] gallons, and the district on the south side of the Thames 4,134,000 gallons. The inhabitants of the northern suburb are partly supplied by a ninth company, from ponds at Hampstead and Highgate. The six companies which draw their supply from the Thames have large reservoirs, into which the water is pumped by powerful engines, and allowed to remain sufficiently long for the subsidence of the grosser impurities. Besides these sources of supply, London has the advantage of possessing, in many parts, springs of peculiarly fine water; and there is little doubt that the comparative state of healthiness enjoyed by the inhabitants must be in a great measure attributed to the abundant supply of water and the excellent drainage.

The consumption of the metropolis, in regard to some principal articles which are under the management of the excise, may be stated with tolerable accuracy. The following statement gives the number of bushels of malt used by the London brewers, and the quantities of British and foreign spirits, tobacco, and snuff, which have been sent out with permits by the dealers or manufacturers, for consumption, in different years since 1827:—

Years.	Malt used in Brewing. Bushels.	Sent out of Stock for Consumption. Foreign Spirits. Gallons.	British Spirits. Gallons.	Tobacco. lbs.	Snuff. lbs.
1827	3,964,649	1,512,268	4,602,376	3,167,503	[illegible]
1830	3,176,046	1,485,953	5,222,145	3,359,273	818,946
1833	4,653,526	1,471,267	5,218,318	3,384,744	1,107,680
1835	5,284,926	1,420,600	5,941,351	4,038,317	1,086,492
1837	5,692,360	1,270,931	5,354,388	3,636,362	1,181,733

Some abatement from the above quantities, but in what proportion cannot be stated, must be made before we can ascertain the actual consumption of the metropolis, because many persons who reside beyond its limits procure supplies from London tradesmen.

Police.—Until comparatively a recent period, the police of this metropolis was very defective, although the subject had engaged the attention of the public, and had been investigated by numerous committees of the House of Commons at various times during the last fifty years. The 'Treatise on the Police of the Metropolis,' published by Mr. Colquhoun in 1797, revealed such dreadful scenes of depravity as powerfully engaged the public attention; and to that work may in a great measure be attributed the reforms which have at length been introduced. Deplorable as was the state of the police when Mr. Colquhoun's work was published, it was not worse than it had been for some centuries. As recently as the beginning of the eighteenth century it was highly dangerous to venture abroad, alone and unarmed, after dark, except in the most frequented parts of the town; and in 1728 a plan was formed for robbing the queen in St. Paul's Churchyard, as she returned from supper in the city to St. James's; but the gang being engaged in robbing Sir Gilbert Heathcote, an alderman, on his return from the House of Commons, her majesty passed unmolested. Many facts are recorded by Maitland and other historians, showing the height to which open violence was carried in those days. Fielding, writing in 1751, says: 'The great increase of robberies within these few years is an evil which to me appears to deserve some attention. In fact, I make no doubt but that the streets of this town, and the roads leading to it, will shortly be impassable without the utmost hazard; nor are we threatened with seeing less dangerous gangs of rogues among us than those which the Italians call the banditti. What indeed may not the public apprehend when they are informed, as an unquestionable fact, that there are at this time a great gang of rogues, whose number falls little short of a hundred, who are incorporated in one body, have officers and a treasury, and have reduced theft and robbery into a regular system? There are of this society men who appear in all disguises and mix in most companies.' Even so recently as the end of the last century there were many places in the metropolis where swarms of the most desperate men openly congregated, in perfect security from the police, which dared not disturb them. Among these places of resort were some, the names of which have been handed down to us as infamous for the crimes which were perpetrated in them. Open violence is now fortunately at an end, and even in the most lonely parts of the suburbs an efficient police ensures personal safety at all hours of the night. The vice which still exists is of a less obtrusive character, and crimes are now for the most part confined to depredations on property. Society has been thus tending towards improvement during the last forty or fifty years, but it is during the latter half of this period that the amendment has been most apparent. The evidence given before a committee of the House of Commons, in 1816, still detailed scenes and circumstances of villainy which are no longer to be witnessed. The establishment of the metropolitan police force, under an act of parliament in 1829, has been mainly instrumental in producing this improvement. The regulations for its management are calculated for the prevention rather than the punishment of crime, it having been among the gravest charges made against the system which it superseded that men were nursed in crime until the length to which they proceeded produced the offer of rewards for their apprehension.

The police force is under the management of two commissioners, who are in direct communication with the secretary of state for the home department; under the commissioners are 17 superintendents, 70 inspectors, 342 sergeants, and 2968 constables. The district under their care extends from Brentford Bridge on the west, to the river Lea on the east, and from Highgate on the north, to Streatham and Norwood on the south, excluding the city of London. The population of this district, at the census of 1831, was 1,493,012 souls, and the rental of houses assessed for the relief of the poor within the same, in 1837, amounted to 6,177,113*l.* per annum. The constables and officers must be men of good character, who can read and write, and who at the time of their appointment are not more than thirty-five years of age. They wear a uniform dress, and are altogether a fine and respectable-looking body of men. The whole district is parcelled out into seventeen divisions, to each of which one superintendent and an adequate number of sergeants and constables are appointed; and it is expected that each constable will exert himself to acquire a complete personal knowledge of his district. The system of responsibility throughout the force is perfect. The commissioners are answerable to the government for the due performance of their duties; the superintendents are answerable to the commissioners for their own conduct, and that of the sergeants and constables in their division; and the sergeants are answerable to the superintendents for the good conduct of the constables under their orders. The constables and officers are strictly forbidden to receive any payments or gratuities from private persons. The expense attending this system is greater than that of the old nightly watch, for which it was substituted. The total expenditure, in the year 1837, amounted to 209,751*l.* 11*s.* 11*d.*, and the charge for the former nightly watch, in the same districts, was 137,288*l.* 18*s.* 6*d.* For this difference, 72,465*l.* 13*s.* 5*d.*, the inhabitants have the benefit of an efficient day police in exchange for an inefficient nightly watch, which was frequently entrusted to infirm old men. The expense chargeable on the parishes is limited to an assessment of eightpence in the pound on the rental, and all beyond this is defrayed from the public purse. Three-fourths of the whole expense are borne out of the parish rates, limited as above mentioned; and the remaining one-fourth is paid by the Treasury. The efficiency of the metropolitan police may in part be seen from the statement of the number of persons taken into custody by its constables, in each year since it came fairly into operation, and which were:—

1831	.	72,824	of whom	31 353	were drunk.
1832	.	77,543	..	32,636	..
1833	.	69,959	..	29,880	..
1834	.	64,269	..	19,779	..
1835	.	63,474	..	21,794	..
1836	.	63,384	..	22,728	..
1837	.	64,416	..	21,426	..

The total number of persons charged with offences by the metropolitan police force in the year 1838 was 71,802, of whom 48,742 were accused of petty offences, and the remaining 23,060 of crimes usually tried before a jury. Of these numbers 20,697 in the first class, and 14,820 in the second class, or about one-half, were discharged on a hearing by the magistrates, only 2951 were committed for trial, 15,876 were discharged on payment of fines—chiefly cases of drunkenness, and the remainder were sentenced summarily by the magistrates to various short periods of imprisonment. Among the persons committed for trial, 5 were accused of murder, 16 of manslaughter, and 88 of burglary and housebreaking: the others were charged with larcenies, breaches of the peace, and other offences of inferior degree.

It will be seen that a large proportion of the persons included in these numbers were taken into custody by reason of their being drunk, in which condition they hold out temptation to dishonest persons, and require to be protected.

It has been mentioned that this police force has no authority within the City. The day and the night police in the City were till lately established on two systems wholly unconnected with each other. The day police was under the control of a committee of the court of aldermen, and its operations embraced the whole city without any reference to its division into wards, while the duty of providing the nightly watch was left to the ward authorities, each ward supporting an independent establishment of its own. The day and night police are now consolidated, and consist of—

1	Superintendent.
12	Inspectors.
50	Sergeants.
438	Constables.
501	

It is organised as nearly as possible on the plan of the metropolitan police, the City being divided for this purpose into 6 districts. There are besides, connected with the business of the justice-rooms, four men specially called police officers, and three men placed at the Mansion-house and Guildhall: the whole of this force is directed by the superintendent. Its duties are confined to the north side of the Thames, Southwark being under the metropolitan force.

There are further provided for preserving the peace of the metropolis, nine police offices, each of which has attached to it three magistrates. The offices are—

Bow Street, having attached to it	.	10 officers.
Queen Square,	„ .	6 „
Marlborough Street,	„ .	7 „
Marylebone,	.	7 „
Hatton Garden,	„ .	6 „
Worship Street,	„ .	7 „
Whitechapel,	„ .	6 „
Union Hall,	„ .	8 „
Thames Police,	„ .	6 „

In addition to this there is a River Police attached to the Thames Police Office, and employing 22 Thames police surveyors and 70 river constables. The expense of these establishments is 51,724*l.* 5*s.* 5*d.* per annum. The horse-patrol was attached to the office in Bow Street until October, 1836, when it was made part of the metropolitan police force; it comprises a conductor, 4 inspectors, and 66 patrols. Their sphere of action is in the less frequented roads around the metropolis. Their respective beats and the hours of visiting different localities are continually being changed, according to the directions of the superintendents of police.

The sessions of the peace for the city of London are holden eight times in the year. The judges are the lord-mayor, aldermen, and recorder, any four of whom form a quorum, but the recorder is the acting judge. Before the establishment of the Central Criminal Court the jurisdiction of the London sessions court extended to all kinds of felonies, but in practice all crimes (except treason) which were capital by common law and all which have been called felonies by statute were tried at the Old Bailey sessions. The Central Criminal Court has twelve sessions in the year. This court was established 'for the trial of offences committed in the city of London, the county of Middlesex, and those parts of the adjoining counties which lie within the parishes of Barking, East Ham, West Ham, Little Ilford, Low Layton, Walthamstow, Wanstead, St. Mary Woodford, and Chingford, in Essex; Charlton, Lee, Lewisham, Greenwich, Woolwich, Eltham, Plumstead, Deptford, Kedbrook liberty, and Nottingham hamlet, in Kent; Southwark, Battersea, Bermondsey, Camberwell, Christchurch, Clapham, Lambeth, St. Mary Newington, Rotherhithe, Streatham, Barnes, Putney, Tooting, Graveney, Wandsworth, Merton, Mortlake, Kew, Richmond, and Wimbledon, in Surrey.' This new criminal court was established in 1834, under the act 4 and 5 William IV., c. 36, and empowers 'the lord-mayor of London, the lord chancellor, the judges, the aldermen, recorder, and common-sergeant of London, and such others as his majesty may appoint, to be judges of a court to be called the Central Criminal Court.' These judges or any two of them 'may determine all such treasons, murders, felonies, and misdemeanors as might be determined under any Commission of Oyer and Terminer for the city of London or county of Middlesex, or commission of gaol delivery to deliver the gaol of Newgate, at such times and places in the said city or suburbs thereof as by the said Commissioners shall be appointed.' The district thus described is to be considered as one county for all purposes under the act. The juries are summoned from London, or from the counties, or from both indiscriminately. The sessions thus authorised are to be holden twelve times at least in every year. This court is further empowered to try persons for offences committed on the high seas and other places within the jurisdiction of the admiralty of England, for which separate sessions used formerly to be held by the judges of the admiralty court. The great bulk of the cases brought before the Central Criminal Court are larcenies, unaccompanied by violence. The frequency of the sessions is found to be a great improvement; persons who may be wrongfully accused are speedily released, and the guilty are more quickly brought to justice.

Prisons.—There are nine prisons for the confinement of offenders within the metropolis. These are—

1. The Gaol of Newgate
2. The Giltspur-Street Compter } in the City of London
3. The Bridewell Prison
4. The New Prison, Clerkenwell, Middlesex County Gaol
5. The Coldbath-fields, County House of Correction
6. The Westminster, County Bridewell
7. The Horsemonger Lane, Surrey County Gaol
. The Borough Compter
. The Penitentiary at Millbank.

The Gaol of Newgate is under the control of the Corporation of London, and is the principal prison appropriated to the reception of persons brought before the Central Criminal Court. This prison has at various times been stigmatised as one of the worst regulated in the kingdom, and although various reformations have been attempted, but little effectual good appears to have been thus accomplished. In the third Report of the Inspectors of Prisons, presented to Parliament in 1838, it is stated 'that this great metropolitan prison, while it continues in its present state, is a fruitful source of demoralization, and a standing reproach on the character of the Corporation of the City of London.' The more heinous classes of offenders are placed in separate cells which are not warmed, have no privies, and are without stool or table, but in each of them is placed a Bible and Prayer Book. The numbers of persons confined in this prison in the course of the year ending Michaelmas, 1837, was 3349, of whom 802 were females. The greatest number at any one time in that year was 342, of whom 123 were females. The current expenses of the prison for the year amounted to 7785*l.* 15*s.* 10*d.*

The Giltspur-Street Compter is under the jurisdiction of the Lord Mayor and Court of Aldermen. Prisoners of every denomination and character are crowded together in the wards, yards, and sleeping cells of this prison without any possibility of classification, and, as we find it stated in the last Report of the Inspectors of Prisons, 'The Giltspur-Street Compter continues a wretched prison, with no efficient means of affording a salutary discipline. The prisoners are left together in large numbers in idleness and unrestrained communication during the whole 24 hours.' The number of prisoners confined there in the course of the year 1837 was 552 males and 130 females; the greatest number at any one time was 124 males and 48 females.

The Bridewell prison is under the jurisdiction of the governors of Bridewell and Bethlehem Hospitals, and is used for the reception of persons summarily convicted by the lord mayor or sitting aldermen. The prisoners are for the most part petty pilferers, misdemeanants, and vagrants: refractory apprentices brought before the aldermen or chamberlain of London are also sent here to solitary confinement for short periods. The prisoners were formerly employed, as a punishment, in beating hemp, which occupation has given place to the modern invention—the tread-wheel. The inmates are classified, and the *silent system* has been adopted. There were confined in this prison in the year ending Michaelmas, 1837, 770 males and [illegible] females; the greatest number at any one time was 90 males and 29 females. The current expenses in that year amounted to 1934*l.* 15*s.* 1*d.*

The new prison, Clerkenwell, is the general receiving prison of Middlesex for offenders committed, either for examination before the police magistrates, for trial at the sessions, for want of bail, and occasionally on summary conviction. Some degree of classification has latterly been attempted, but as the limits of the prison oblige 30, 40, or more prisoners to remain together in a small room, this division must be more nominal than real; the attempt is indeed limited to marking divisions on the floor, within which certain classes are desired to remain. The number confined in the year ending Michaelmas, 1837, was [illegible] males and 2054 females, but the greatest number at any one time was 205 males and 109 females; the expenses for the year amounted to 3763*l.* 10*s.* 2*d.*

The Coldbath-fields County House of Correction is under the jurisdiction of 14 visiting magistrates appointed at each quarter-sessions · four go out of office quarterly by rotation. This prison contains felons, misdemeanants, and persons committed under the designation of rogues and vagabonds. It contains a tread-wheel. The prisoners are kept separate in classes in the different wards, and the silent system is strictly enforced. The discipline is said by the prison inspectors to be extremely good. In the year ending Michaelmas, 1837, there were confined 6625 males and 3125 females; the greatest number at any one time having been 929 males and 319 females; the expense to the county, exclusive of alterations and repairs, was 13,4[illegible]*l.* 14*s.* 9*d.*

The Westminster County Bridewell in Tothill-fields is under the jurisdiction of the magistrates for the City of Westminster. It is a modern building, having been first occupied in 1834: it cost upwards of 200,000*l.* The prison contains 42 day-rooms and 348 sleeping apartments, in addition to 120 dark cells in the basement. The classification of prisoners is accomplished to a great extent. Prisoners who have been convicted are subjected to the silent system. There are two tread-wheels in the prison, and two schools have been established, one for boys, the other for girls, under 17 years of age, who are committed to the prison. In the year ending at Michaelmas, 1837, there were confined 3085 males and 2439 females; the greatest number at any one time was 438, of whom 159 were females. The current expenses of the prison were 5578*l.* 7*s.* 4*d.*

The Surrey County Gaol, in Horsemonger Lane, Southwark, is under the jurisdiction of the sheriff, court of quarter-sessions, and 12 visiting magistrates of the county of Surrey. This prison contains debtors as well as criminals of all degrees, which latter are not classified, nor kept separate to any useful extent. In the course of the year, to Michaelmas, 1837, there were in this prison 1193 male and 107 female debtors. Of other prisoners the numbers were 1901 males and 605 females; the greatest number of these at any one time was 233 males and 62 females, together 295. The expense in that year was 3316*l.* 0*s.* 2*d.*

The Borough Compter, in Mill-lane, Tooley Street, is under the jurisdiction of the lord-mayor and court of aldermen of London, and the high-bailiff of Southwark. The prisoners consist of debtors, of persons committed for trial for felonies and misdemeanors, and others tried and sentenced to imprisonment, but not to hard labour; those prisoners who are sentenced to labour are sent to the County House of Correction at Brixton. The defects in the discipline and management of this prison were strongly animadverted on by a Committee of the House of Commons in 1829, and in their Report of 1838 the Inspectors of Prisons remark that 'its general state is as deplorable at this moment' as it was then. In the year ending Michaelmas, 1837, there were confined 273 male and 32 female debtors; 688 males and 464 females accused of offences; the greatest number of these at any one time was 69, of whom 23 were females: the expenses of the prison were 878*l.* 19*s.* 8*d.*

The Penitentiary at Milbank was established in 1820, and placed under the direction of the Secretary of State for the Home Department. It is built upon the plan recommended by the late Mr. Jeremy Bentham, which admits of the most perfect classification and supervision: it cost nearly half a million of money, and is capable of containing 1100 prisoners. The whole establishment is managed by a committee appointed by the Secretary of State. The prisoners are in great part persons sentenced to transportation or to death, whose punishment has been commuted to imprisonment, and it has no peculiar connexion with the police of the metropolis.

Lighting.—The whole of London is now well lighted with coal-gas. In 1694 it appears that the City was partially lighted with lamps. By the act passed in that year under which the Orphans' Fund was created, the sum of 600*l.* per annum was assigned towards that fund as 'arising from a lease granted for 21 years by the corporation, of certain lights to be used in the City;' from which it may be inferred, that the city authorities in those days derived a revenue from granting the privilege of lighting to private parties, who must of course have taken their remuneration from householders. At the expiration of the lease here mentioned, viz. in 1716, an act was passed by the municipal parliament repealing all former laws upon the subject, and ordering that for the future every housekeeper should hang out a light before his door with sufficient cotton-wicks to burn from six o'clock in the evening until eleven of the same night, after which hour the streets were consequently left in darkness. The housekeepers were at liberty to discontinue the lighting of their street lamps between the seventh night after each new moon and the third night after it arrived at the full—an instance of economy which is still practised in many of the provincial towns of this kingdom. Every housekeeper who should omit to hang out the necessary light on all other nights was fined one shilling for each offence. This system proved to be exceedingly troublesome and unsatisfactory; and after a few years a company was established which in return for a payment of six shillings per annum, which it was authorised to demand from each householder rated for the support of the poor within the city, engaged to provide a sufficient number of lamps and to keep them lighted from six o'clock until midnight. The company further engaged to pay to the Orphans' Fund the yearly sum of 600*l.* above mentioned. The insufficiency of the light thus provided may be inferred from the numerous depredations then committed in the city by highwaymen, who, riding into the streets after nightfall, perpetrated their outrages with impunity. This evil rose to such a height that government found it necessary to offer a reward of 100*l.*, a large sum in those days, for the apprehension of every highwayman in the city of London or within five miles of the same. After these evils had been endured for some years a further and a more effectual improvement was introduced. The contract just mentioned was cancelled, and an act of parliament was procured in 1736, authorising the corporation to set up as many glass lamps as should be necessary, and to keep them lighted throughout the year from the setting to the rising of the sun. To defray the cost the corporation was empowered to levy an annual rate upon every householder proportioned to the value of his house. This system was found to answer well, and continued in operation until the introduction of gas-lighting. During the 70 years that intervened London enjoyed the reputation of being the best lighted city in Europe, but no person, unless he can remember the nightly appearance of the metropolis previous to the adoption of gas-lighting, can be sufficiently aware of the value of the improvement, nor of the degree in which it operates as a measure of police. The lamps are now lighted by various joint-stock companies possessing large capitals, and which are content to derive a low rate of remuneration for the lighting of street-lamps, in return for the opportunity of supplying shops and private houses, which pay more liberally. The first established of these gas companies received a charter of incorporation in 1812; it has three stations, one in the Horseferry-road, Westminster, another in Brick Lane, Old Street, and the third in the Curtain Road, Shoreditch. Several other companies have since been established; the more important of these are, the City of London, the Imperial, the British, the Independent, and the Equitable gas companies; these supply among them more than 60,000 lights over a field extending from Bow on the east to Brentford on the west, and from Edmonton on the north to Brixton on the south. Their aggregate incomes for these lights, derived from parishes and private consumers, exceed a quarter of a million of money per annum: of this sum the corporation of London pays about 10,000*l.*

Sewers.—The sewers of the metropolis and adjacent districts, comprehending a circle of ten miles, measured from the Post-Office, are divided into seven trusts, and placed under the management of as many boards of commissioners, viz.:—

1. The City and Liberties of Westminster.
2. Holborn and Finsbury division.
3. Blackwall, Poplar, and Stepney division.
4. The City of London.
5. The Tower Hamlets division.
6. From the river Ravensborne, in Kent, to the river Mole, in Surrey.
7. Regent Street division.

There are no means of ascertaining the aggregate length of the sewers throughout these divisions. Those under the commissioners for the City of London are about 15 miles in extent, and form only a small part of the drainage of the whole metropolis. Sewers were first constructed in London in the reign of Henry VI., under an act (6 Hen. VI., c. 5) passed in 1428. This act was amended by parliament in the reign of Henry VIII.; and the law relating to sewers, passed in the twenty-third year of that reign, is still substantively adhered to by two of the seven boards of commissioners, the fifth and sixth of the above list; the other five boards are regulated by local acts. The expenses attending upon the construction and management of sewers in the different districts are repaid by means of rates levied upon the householders at the discretion of the several boards of commissioners. In the City of London the rate cannot exceed 4*d.* in the pound on the rental. Much dissatisfaction existed some years ago in regard to the efficiency of the sewerage in different parts of the metropolis. Drains which had been adequate to the drainage and cleansing of a district in former times were rendered by degrees wholly inadequate, through the increase of the population. Much has of late years been done to meet this objection; the subject has been investigated by a Committee of the House of Commons, appointed in 1834; and although there are still some obscure corners where the health and comfort of the inhabitants might be improved by a better attention to the sewers, it may be fairly stated that the drainage and the removal of impurities from London are, upon the whole, satisfactorily accomplished. The sum collected in the City of London district for sewers-rate in 1838 was 12,214*l.* 8*s.* 1*d.*

Fires.—An important part of the police of a city consists in the measures taken for the prevention and extinction of accidental fires. After the Great Fire of London, in September, 1666, an order was issued forbidding any person to proceed in rebuilding his premises until some general plan should be devised for rebuilding the city in such a manner as should prevent the recurrence of a similar misfortune. The chief improvements introduced at that time consisted in widening the streets and employing bricks for building the houses instead of wood and lath and plaster, which had previously been very generally used. The regulations adopted on that occasion were extended and improved from time to time by various acts of parliament until 1774. In that year an act was passed (14 Geo. III., c. 78), commonly called the Building Act, repealing former acts, regulating the mode of building so as to render houses 'ornamental, commodious, and, by providing party-walls of a certain thickness, secure against the accidents of fire.' Under this act it was further rendered incumbent on churchwardens to provide one or more fire-engines in every parish, to be in readiness on the shortest notice to extinguish fires; and also to have in constant readiness ladders to favour the escape of persons from burning houses. It was further made incumbent on the churchwardens to fix fire-plugs at convenient distances upon all the main water-pipes within the parish, and to have keys to open the same, so that the water might be instantly made available. Graduated rewards were also established by the same acts to persons bringing the first three parish engines for the extinction of a fire. These measures have since been greatly aided by the various offices for insuring property against fire, which have maintained, at their own charge, numerous fire-engines and corps of firemen. The legislature on its part gave facility to the officers by granting protection against impressment into the navy to those firemen who were chosen from among the watermen and lightermen employed upon the Thames. Until a recent date each of the insurance offices maintained its own engines and corps of firemen independently of all other similar establishments. A few of the most extensive made an arrangement among themselves in 1825, by which their engines and firemen were placed under the orders of one superintendent; but it was not until 1833 that the fire-offices of London became generally united for this purpose under one uniform system, each office subscribing towards the expense of the establishment in a certain agreed proportion. Under this arrangement, which is superintended by a committee of delegates, one from each of the associated offices, London is divided into five districts, three on the north and two on the south side of the Thames, viz.:—

North. 1. From the eastward to Paul's Chain, St. Paul's Churchyard, Aldersgate Street, and Goswell-street-road.
" 2. From the above district to Tottenham-court-road, Crown Street, and St. Martin's Lane.
" 3. Parts to the westward of the foregoing.
South. 4. From the eastward to Southwark-bridge-road.
5. From Southwark-bridge-road westward.

The force employed consists of a superintendent, 5 foremen, 10 engineers, 9 sub-engineers, 31 senior firemen, 35 junior firemen and 6 extramen, and the number of engines in constant readiness is 33, which are kept at 20 different stations in various parts of the metropolis: two are floating engines, kept on the river, one moored off King's Stairs, Rotherhithe, the other off the Southwark Bridge. One-third of the men employed are constantly on duty, day and night, at the engine-houses, and the whole are liable to be called upon whenever a fire occurs. The superintendent, who must repair to the spot, wherever it may be, when a fire breaks out, has power to employ any additional number of men that may be wanted. The firemen are uniformly clothed, and have their heads protected with helmets made of hardened leather; they are provided with the most approved apparatus for the suppression of fires, the rescue of man life, and the saving of property: including ropes l lengths of scaling-ladders capable of being readily con-ted to any required length. The advantages attending an organized force of this description must be apparent. We have no record of the number of fires that occurred previously to its establishment in the metropolis, but a record has since been kept from which the following particulars are taken:—

Year.	Number of Fires.	Wholly burnt.	Severely damaged.	Slightly damaged.	Fires in which lives were lost.	Number lives lost.
1833 ..	458	31	135	292	5	12
1834 ..	482	28	116	338	5	7
1835 ..	471	81	125	315	7	11
1836 ..	564	33	134	397	14	14
1837 ..	501	22	122	357	16	13
	2,476	145	632	1,699	47	57

Revenues, &c.—The revenue of the corporation of the City of London is derived from various sources, the principal of which are rents of premises, dues, and market-tolls. The receipts and expenditure for the years 1831 and 1832, as given in to the Municipal Corporation Commissioners, were as follows:—

RECEIPTS.	1831.			1832		
Rents and quit-rents .	£46,900	9	10	£45,998	4	6
Rents and navigation of Thames .	1,949	1	5	9[illegible]5	17	2

	£176,147	8	3	186,9[illegible]	[illegible]	[illegible]

The first item in the above statement of expend requires some explanation. The court of the lord- and aldermen of London had from time immem acted as the guardians of the children of deceased den and as trustees of their property. The corporation ha advanced large sums to the government upon the se of Exchequer Tallies, which were totally lost to upon the shutting of the Exchequer in 1672, this c stance, with the losses occasioned by the Fire of L occasioned a deficiency in the sum owing to its wards and other creditors of 747,472*l.* An act was ingly obtained (5 and 6 Will. and Mary, c. 10), e 'An Act for the relief of the Orphans and other Cr of the City of London,' in the preamble of which the mentioned deficiency is attributed to 'sundry accide public calamities,' which act established a fund for ment of the interest upon the above sum, which pay interest for ever was declared to be in full satisfact debt. The fund created consisted of a charge of annum on the lands and revenues of the city; the of aqueducts, or the right of bringing water into the 2000*l.* per annum to be levied by assessment on th habitant householders; 600*l.* per annum arising fr lease granted of the right of lighting lamps, as else explained; a tax of 2*s.* 6*d.* on binding each appren freeman: and of 5*s.* upon every person admitted freedom of the city; 4*s.* per tun upon wine import London; and 4*d.* per chaldron on the metage of coals;

6*d.* per chaldron upon all coals imported. The last tax was to commence in 1700, and to continue for 50 years; after which the lands of the city were to be charged with 6000*l.* per annum more in favour of the orphans' fund; but in 1750 the coal-tax was renewed for 35 years; and in 1767 it was further extended to 1831; and it was afterwards continued to 1837. The debt for which these charges were originally made was fully discharged in 1820, the duties imposed having been rendered more productive than was expected, owing to the great increase of the city; but it was found convenient to continue them in order to provide for the discharge of debts otherwise and subsequently incurred for various buildings and improvements, among which may be mentioned Blackfriars Bridge, Newgate prison, the Middlesex sessions-house, and improvements at Temple Bar and Snow Hill. More recently the coal duties have been continued on account of a million of money borrowed to make suitable approaches to the new London Bridge.

The total produce of the various charges and duties authorized by the act of 1694 produced between that year and 1829 is as follows:—

Payments from city revenues	£1,324,750
Aqueducts	62,441
Assessments on inhabitant householders	203,907
Lights	21,000
Apprentice bindings	34,277
Freedoms	41,250
Duty on wine	363,442
Metage and duty on coals	3,718,059
Sale of ground, &c.	50,975
	£5,820,101

The passing of the bill through parliament (1694) to authorize the levying of these duties was accompanied by an extraordinary circumstance. Considerable delay having been experienced in the proceedings of the House of Commons, the city chamberlain was authorised to disburse such sums as should be found necessary for expedition. Through some want of caution the government came to suspect that bribery was used, and a committee of the House of Commons being appointed to investigate the matter, it came out that the Speaker had actually received 1000 guineas for his services in expediting the bill through the house, and that two other members had been guilty of similar corruption. The three were consequently forthwith expelled from the house.

The freehold estates belonging to the corporation within the city are situated chiefly in and about Broad Street, Fenchurch Street, Aldgate, and the Minories. It has also a considerable estate in the parish of St. George's, Hanover Square, and possesses five-sixths of a leasehold estate under the chapter of St. Paul's This lease has been held since the beginning of the fourteenth century, and will expire in 1867. The net produce to the city arising from ground-rents is 7500*l.* per annum, but the annual value which will lapse to the church in 1867 is expected to amount to 50,000*l.* or 60,000*l.*

Most of the companies are in possession of real property and money in the public funds, but as many of them refuse to state the nature and amount of their property, it is not possible to speak more precisely on the subject. The Drapers' Company made a return to the Municipal Corporation Commissioners, from which it appears that their yearly rents amount to 23,400*l.*; and the Fishmongers have in like manner stated their income from real property to be 17,973*l.* per annum. It is known that other companies, and particularly the Mercers, Goldsmiths, and Merchant Tailors, hold large landed estates within the city of London, and elsewhere, both for their own use, and on various trusts; but the particulars of these estates are not made public.

The Irish Society is a corporation connected in a peculiar manner with the corporation of London. The origin of this connection was as follows. In the reign of James I. a considerable part of the province of Ulster was forfeited to the crown, and proposals were entertained for establishing an English colony in that province. In pursuance of this scheme articles of agreement were executed in January, 1609, between the lords of the king's council and a committee appointed by the common-council acting on behalf of the mayor and commonalty of the city of London for establishing corporations in Derry and Coleraine. It was arranged that 20,000*l.* should be advanced by a London company, to consist of a governor, deputy-governor, and 24 assistants; that the governor and five assistants should be aldermen of London; that the recorder should be another assistant, and that the deputy-governor and the rest of the assistants should be citizens of London, to be elected annually by the common-council. The Society, being thus appointed, was soon after put in possession of the estates. The sum subscribed for the purpose amounted eventually to 60,000*l.*, and was chiefly furnished in different proportions by the most wealthy of the London companies. [LONDONDERRY.] The Society was incorporated on the 29th of March, 1619, and the town of Coleraine and the county of Londonderry were granted to the Society and their successors for ever. By another charter granted to the Society by Charles II. in 1662, power was given to the common council of Londonderry to make bye-laws for the government of the city, but to give them validity it was necessary that these bye-laws should be confirmed within a limited time by the Irish Society. The accounts of the Society since 1831 have been printed and laid before the court of common-council. The estates have been the subject of a suit in chancery, which has confirmed the title of the corporation to all except the lands that had been granted to the companies.

Pauperism.—Although employment may easily be obtained in London by persons in health, and adequate wages are paid, a considerable proportion of these wages are spent in intemperance, which adds largely to the amount of wretchedness owing to misfortune, sickness, and other causes. Under the orders of the commissioners for executing the act of 1833 for the amendment of the law relating to the poor, the metropolis, so far as it has hitherto been brought under the provisions of the new poor law, is divided into 26 districts or unions, as enumerated and described below, each of which is managed by a board of guardians, elected by the rate-payers of every parish within the union. in some cases the parishes are too large and populous to admit of their being satisfactorily united for this purpose; and some parishes are governed under special and local acts of parliament, which oppose difficulties to such junction. The divisions, the amount of their population in 1831, the number of guardians elected in each, and the sums expended for relief of the poor in the year ending 25th March, 1838, are as follows:—

	Population, 1831.	No. of Guardians.	Expended for Relief of Poor in Year ending 25th March, 1838.
Holborn Union	42,649	20	£11,527
St. George's in the East	38,505	18	11,683
St. Leonard's, Shoreditch	68,564	21	17,318
St. Martin in the Fields	23,732	24	9,318

Begging is followed as a trade or profession in the metropolis perhaps more systematically than in any other city. The subject has at various times attracted the attention of the legislature, and considerable light has been thrown upon it by the Reports of committees of the House of Commons. In one of these Reports it was stated on evidence that two houses in St. Giles's parish (which is the principal resort of beggars) are frequented by considerably more than 200 persons, who hold in them a kind of club, from which all who are not of their profession are excluded; that children are let out by the day, and that the hire paid for deformed children is sometimes as high as four shillings per day, and that a regular school is kept in the same district where children are instructed in the arts necessary to their success as beggars. It has been stated that the number of professional beggars in and about London amounts to 15,000, more than two-thirds of whom are Irish; but this statement rests upon no certain foundation, and has been variously considered as too high or too low, according to the views which different persons take of the condition of society. It is ascertained that few of the street-beggars who pretend to be husband and wife are really married. The Mendicity Society was formed in 1818 for the purpose of remedying this evil, by affording relief to really deserving persons, and by exposing and punishing the professional beggar and impostor. This Society has an office and establishment in Red Lion-square, Holborn, and has, through the constant activity of its managers, been instrumental in moderating the evil, which however is too great in degree to be successfully combated by any merely private association.

Savings' Banks.—The various savings' banks that are open within the limits of the metropolis are no doubt resorted to by some persons who reside beyond it; and it is therefore not possible to ascertain with precision the amount of deposits made by the metropolitan population. After a careful examination of all the returns and other documents extant upon the subject, it appears that there were, on the 20th November, 1837, about 97,000 individuals resident within the metropolitan limits who had accounts open at the different savings' banks, and that the sum standing at the credit of their accounts was about 2,450,000*l.*, being 18 per cent. of the total number of depositors in England, and 15 per cent. of the total amount of their deposits. It is supposed that the class of domestic servants, who are very numerous in London, forms by far the largest proportion of depositors in savings'-banks.

Charities, Hospitals, &c.—The public charities and hospitals within the limits of the metropolis are very numerous, and many of them richly endowed. The royal hospitals of Greenwich for seamen and of Chelsea for soldiers are national establishments, and wholly independent of private support. The revenues of Greenwich Hospital are derived partly from estates in Cumberland, on which lead-mines are profitably worked, and partly from a payment of sixpence per month stopped from the wages of seamen, and in time of war from unclaimed prize-money. In Greenwich Hospital there are usually about 3000 maimed and superannuated seamen, who are boarded, lodged, and clothed, and provided each with one shilling per week pocket-money. There are besides about 32,000 out-pensioners receiving various allowances from 3*d.* to 1*s.* 6*d.* per diem. The great officers of state are nominally governors of the hospital; but it is really managed by twenty-four directors, a governor, and a lieutenant-governor. Chelsea Hospital, which is for the army, accommodates about 400 in-pensioners, and a great number of out-pensioners. The expenses are defrayed by means of contributions stopped from the pay of every officer and private soldier in the army; the deficiency, if any, being provided for by parliament. The establishment is under the direction of commissioners, a governor, and a lieutenant-governor. Connected with these two hospitals are the Royal Naval Asylum at Greenwich and the Royal Military Asylum at Chelsea, the former for the education and maintenance of 800 boys and 200 girls, the children of seamen of the Royal Navy; the latter for giving the same advantages to 700 boys and 300 girls, the children of soldiers.

The charities connected with the corporation of London are Christ's Hospital, better known as the Blue-coat School, Bridewell and Bethlehem Hospitals, St. Bartholomew's Hospital, and St. Thomas's Hospital, all of which were founded by Edward VI. Christ's Hospital contains about 1200 boys, to whom good classical, commercial, and mathematical instruction is given. They are also boarded and clothed: the annual expenses of the establishment amount to 30,000*l.* The lord-mayor and corporation of London are directors of the hospital; there are besides about 350 governors, each one of whom, at his election to the office, presents 400*l.* to the institution. The children are admitted on the nomination of the directors and governors, who exercise their privilege in rotation. Bridewell Hospital, which is under the management of the same board of governors as Bethlehem Hospital, is now used only as a prison, under which head it is noticed. Bethlehem Hospital, first erected in 1675 in Moorfields, was removed in 1814 to Saint George's Fields. It is employed for the reception and treatment of insane patients, of whom about 200 are constantly accommodated. This has lately been found inadequate to the wants of the poor who are thus afflicted in the city of London, and the building is at this time (January, 1839) receiving two additional wings. [As to St. Bartholomew's Hospital, see BARTHOLOMEW'S HOSPITAL.]

St. Thomas's Hospital, in Southwark, is governed by the lord-mayor, aldermen, and 12 common-councilmen of London, and 180 governors through donations of 50*l.* and upwards. It is capable of receiving and usually contains nearly 500 patients; besides whom it affords relief to a considerable number of out-patients, who receive advice and medicines gratuitously. There is a medical school attached to this hospital. Other corporations dependent on the corporation of London are, the corporation of the London Workhouse. The Commission of Sewers, Carpenters' School, &c.; and Gresham College, held in conjunction with the Mercers' company.

The other hospitals of the metropolis have been founded and are supported by private benevolence.

Guy's Hospital, St. Thomas's Street, Southwark, founded 1721, and richly endowed by Mr. Guy. A bequest of 200,000*l.* was made to its funds in 1829 by Mr. Thomas Hunt. It contains more than 400 beds, and medical aid is gratuitously afforded to out-patients.

London Hospital, Whitechapel Road, established 1740, and supported by voluntary contributions and subscriptions, gives relief to upwards of 2000 patients in the course of the year, the greater part of whom are surgeons' patients through accidents among the shipping on the river and in the docks, and the various manufactories in the eastern part of London. It has three physicians, three assistant-physicians, three surgeons, and three assistant-surgeons.

Charing-Cross Hospital, King William Street, West Strand, established in 1818, erected in 1831, is supported by voluntary subscriptions. It has an establishment of three physicians and two surgeons.

Westminster Hospital, established 1719; the present building was erected in 1833. It is capable of receiving 230 patients.

St. George's Hospital, Hyde Park Corner, instituted in 1733. The hospital has been recently rebuilt. There are usually nearly 300 in-patients, besides a considerable number relieved as out-patients. Four physicians, with an assistant-physician, an equal number of surgeons, two assistant-surgeons, a house-apothecary, and four visiting-apothecaries are attached to this hospital.

Middlesex Hospital, Charles Street, Oxford Street, instituted 1745, is capable of containing 300 patients, and affords relief also to many out-patients. Persons meeting with accidents are admitted at all times without recommendation. This hospital, which has an adequate number of physicians and surgeons, is supported by voluntary contributions and subscriptions.

The University College Hospital, built on ground opposite and belonging to University College, was opened in November, 1834. It contains beds for 130 patients, and is the hospital for the medical school of the College.

All the above hospitals have medical schools attached to them.

Saint Luke's Hospital, City Road, instituted in 1751, for the reception of poor insane persons, being parish paupers or others. With every parish-patient a sum of 4*l.* must be paid to the hospital; other patients must pay only 1*l.*, which is returned in case of death, or if the patient is discharged within a month. The hospital will accommodate 300 patients. The affairs are managed by governors contributing twenty guineas and upwards to the funds of the hospital.

Small-pox Hospital, St. Pancras, instituted 1746, is supported by voluntary contributions. Since 1799 vaccination has been adopted in this hospital, and upwards of 100,000 persons have been vaccinated by its medical officers. There is also a 'National Vaccine Establishment' in Russell Place, having in connection with it eleven 'vaccinating surgeons' residing in different parts of London and its environs.

London Fever Hospital, St. Pancras, adjoining the Small-pox Hospital, receives at all hours cases of typhus and scarlet fever without recommendation. It is supported by donations and subscriptions, and is at present increasing its means of accommodation.

Lock Hospital, Grosvenor Place, Pimlico, contains 80 patients' beds, viz. 45 for males and 35 for females. It usually receives between 500 and 600 patients during the year.

There are four Lying-in hospitals in various parts of the town, viz.: Queen Charlotte's, founded 1752, situated at Lisson Green, Paddington; the British, 1749, Brownlow Street, Drury Lane; the City of London, 1750, City Road; the General, 1765, York Road, Lambeth.

A floating hospital was instituted in 1821 for the reception of sick and disabled seamen of all nations, who may present themselves without any recommendation. The Dreadnought, a ship of 104 guns, was given for this purpose by the government properly fitted up, and is constantly moored off Greenwich; it is supported by voluntary subscriptions, chiefly from owners and masters of ships trading to the port of London.

There are two Ophthalmic Hospitals, one in Moorfields, established in 1805, the other in Chandos Street, Charing-Cross; two Royal Infirmaries for diseases of the Eye, one in Cork Street, Burlington Gardens, the other in Little Portland Street, Cavendish Square; an Infirmary for diseases of the Skin, in Blenheim Street, Oxford Street; an Infirmary for diseases of the Lungs, in Artillery Street, Bishopsgate; a Royal Universal Infirmary for Children, in the Waterloo-bridge Road; a Royal Metropolitan Hospital for Sick Children, in Broad Street, Golden Square; a Royal Dispensary for diseases of the Ear, in Dean Street, Soho; and eighteen General Dispensaries, situated in various parts of the metropolis, and supported by the residents in the different localities where they are found.

The charitable institutions of the metropolis are so various and so numerous that only the following list of those which are most important can here be given, with the dates of their establishment, as far as can be ascertained.

Foundling Hospital, founded by T. Coram, incorporated 1739.
Scottish Hospital, for relief of natives of Scotland, founded in 1665.
Magdalen Hospital, for penitent prostitutes, established 1758.
London Female Penitentiary, for the same purpose, established 1807.
Hospital for French Protestants, established 1716.
Jews' Hospital, for aged poor and education of children, established 1803.
School for the Indigent Blind, established 1799.
Orphan Working School, established 1760.
Female Orphan Asylum, established 1758.
London Orphan Asylum, established 1813.
Infant Orphan Asylum.
Adult Orphan Institution.
British Orphan Asylum.
Clergy Orphan Asylum, established 1749.
Merchant Seamen's Orphan Asylum.
Sailors' Female Orphan Home, established 1829.
National Benevolent Institution, founded in 1812.
City of London General Pension Society, established 1818.
East London Pension Society.
General Annuity Society, established 1827.
Philanthropic Society, established 1788.
General Philanthropic Society, established 1813.
Society for relief of distressed Schoolmasters.
Literary Fund for relief of Distressed Authors, established 1790.
Marine Society for reception of Poor Boys to be sent to Sea, established 1756.
Deaf and Dumb Asylum, established 1792.
Artists' Benevolent Fund, established 1810.
Artists' General Benevolent Institution, established 1814.
Royal Masonic Institution, instituted 1798.
Society for Discharge of Persons imprisoned for Small Debts, established 1772.
Corporation of the Refuge for the Destitute, established 1805.
Childrens' Friend Society, for Prevention of Juvenile Vagrancy, established at Hackney Wick, 1830.
Royal Humane Society, for recovery of persons apparently dead, established 1774.
St. Ann's Society Schools, established 1709.

The principal charitable establishments, for the purpose of instruction only, are:—

The Westminster School, established by Queen Elizabeth in 1590.
St. Paul's School, founded by Dean Colet in 1510.
Merchant Taylors' School, established 1561.
St. Olave's Free Grammar-School, founded by Queen Elizabeth.
Mercers' Free Grammar-School.
St. Saviour's Grammar-School, founded 1562.
British and Fóreign School Society.
National Society for the Education of the Poor.
Society for promoting Christian Knowledge, instituted in 1699.

The educational establishments of a public character, but not charitable, are:—

University College, London.
King's College, London.
School of the Corporation of the City of London.
The Charter House, founded by Thomas Sutton in 1611, is an hospital, which has a school attached to it. [CHARTER HOUSE.]
The University of London, incorporated in 1837, consists of a chancellor, vice-chancellor, and thirty-six fellows, who are empowered to confer degrees in arts, law, and medicine. The university chambers are at present in Somerset House. It is principally supported by grants from government. The first examination for matriculation in arts took place in November, 1838. The first examination for degrees will take place in May or June, 1839.

Of societies and establishments connected with science, literature, and the arts, the following are the principal:—

The British Museum.
The Royal Society, incorporated 1663.
The Society of Antiquaries, founded 1572.
The Society for the Encouragement of Arts, &c., established 1754.
The Royal Academy of Arts, incorporated 1765.
The Royal Institution, incorporated in 1800.
The Linnæan Society, established 1802.
The British Institution, established 1805.
The Geological Society, established in 1813.
The Society for the Diffusion of Useful Knowledge, established in 1826, incorporated in 1832.
The Horticultural Society, established 1808.
The Mechanics' Institute, in Southampton Buildings, established in 1823.
The Royal Astronomical Society, established in 1820.
The Royal Geographical Society, established 1830.
The Royal Asiatic Society, established 1823.
The Zoological Society, established 1829.
The Architectural Society, established 1831.
The Royal Society of Literature, established in 1820.
The Society of Civil Engineers, established in 1828.
The Statistical Society, established 1834.
The Royal Institute of British Architects, established 1835; incorporated by charter 1837.
The London Institution, established 1806.
Sion College, incorporated 1630.
Entomological Society, instituted in 1806.
Phrenological Society.
City of London Literary and Scientific Institution.
College of Physicians, established in 1518.
College of Surgeons.
Company of Apothecaries.
And several medical societies.

Of late years numerous literary and scientific institutions have been established within the metropolis: their general objects are the same, being the communication of useful knowledge by means of lectures, classes, the formation of libraries, and collections of various kinds.

The principal places of public amusement in the metropolis are:—

The Queen's Theatre (Opera House), Haymarket.
The Theatre Royal, Drury Lane.
——— Covent Garden.
——— Haymarket.
The English Opera House, Strand.
The Royal Adelphi Theatre, Strand.
The Olympic Theatre, Wych Street.
The St. James's Theatre.
The Surrey Theatre.

The Victoria Theatre, Waterloo Road.
The City of London Theatre, Norton Falgate.
The Pavilion Theatre, Whitechapel Road.
The Garrick Theatre, Goodman's Fields.
Astley's Amphitheatre.
Sadler's Wells Theatre.
Royal Fitzroy Theatre, Tottenham Court Road.
Vauxhall Gardens.

The places of general recreation are:—St. James's Park, Hyde Park, Kensington Gardens, the Regent's Park, and Greenwich Park, on the banks of the Thames at Greenwich. With the exception of Greenwich Park, they may all be considered to be in London, and are easily accessible to all the inhabitants of the metropolis.

Trade, &c.—The accidental burning of the Custom House of London, in February, 1814, in which the greater part of the trade records of the port and kingdom were destroyed, renders it impossible to give a complete account of the commerce of the metropolis for any preceding period. The relative proportion of the foreign and colonial trade enjoyed by its merchants during the present century will be sufficiently shown by the following statement of the net amount of customs duty, collected at different times from the year 1815, in London and in all the various ports of the United Kingdom, including London:—

Year.	London.	United Kingdom.
1815	£5,536,441	10,521,551
1820	5,342,731	9,837,279
1824	5 731 238	11,327 741
1826	8 829 789	17,280,711
1827	8,790 829	17,894,405
1828	8.918 310	19,295,403
1829	8 524 261	19,129.615
1830	8,576,163	19,360,750
1831	7,916,993	18,124,725
1832	7,876,660	18,341,188
1833	7,662,521	17,597,697
1834	9,576,972	18 494 316
1835	10,601,600	20,522,895
1836	11,088,207	21,448,741
1837	10,190,006	20,556,559

It appears from these figures, which are taken from official returns, that the payments into the Exchequer by the Custom House of London amount to as much as the net receipts of all the other custom-houses in Great Britain and Ireland. It was expected that the opening of the China trade, and the consequent participation of other ports in the tea trade, which had previously been monopolized by London, would have considerably altered the above proportions; but it will be seen that such has not been the result: in fact, the buyers of this article of general consumption still resort to London as the market in which they can select their purchases to the greatest advantage.

The number of ships, with the amount of tonnage, that have frequented the port, give a better idea of the actual amount of its trade than is afforded by revenue accounts, which must vary with the fiscal regulations of the country, and which exclude altogether goods that enter the port and are re-exported or sent coastwise under bond to other ports in the kingdom. The shipping that cleared outwards to foreign parts in 1753 consisted of—

	Ships.	Tons.
British	1219	153,969
Foreign	150	26,281
	1369	180,250

In 1792 the trade was more than double what it was in 1753. The clearances from the port were in that year—

	Ships.	Tons.
British	1078	310,724
Foreign	504	88,325
	1582	399,049

The shipping belonging to the port in the same year (1792) was—

		Tons.
1109	ships under 200 tons burthen	94,952
368	„ between 200 and 300 tons burthen	91,157
268	„ „ 300 and 500 „	92,970
24	„ „ 500 and 750 „	13,984
1769		293,063
	Indiamen	81,160
	Total tonnage	374,223

The number and tonnage of vessels, British and foreign, that entered the port from foreign parts in each year from 1820 to 1837, will show how greatly its foreign commerce has increased during the last half century:—

Years.	British.		Foreign.		Total.	
	Ships.	Tons.	Ships.	Tons.	Ships.	Tons.
1820	3,354	655,239	856	122,619	4,210	777,858
1821	3,000	585,994	571	89,073	3,571	675,067
1822	3,230	603,167	597	106,099	3,827	709,266
1823	3,031	611,451	865	161,705	3,896	773,156
1824	3,132	607,106	1,643	264,098	4,775	871,204
1825	3,989	785,565	1,743	302,122	5,732	1,087,687
1826	3,495	675,026	1,586	215,254	5,081	890,280
1827	4,012	769,102	1,534	221,008	5,546	990,110
1828	4,094	767,212	1,303	195,929	5,397	963,141
1829	4,108	784,070	1,300	215,605	5,408	999,675
1830	3,910	744,229	1,268	207,500	5,178	951,729
1831	4,140	780,988	1,557	269,159	5,697	1,050,147
1832	3,274	640,057	886	154,514	4,160	794,571
1833	3,421	678,289	1,061	175,883	4,482	854,172
1834	3,786	735,693	1,280	216,063	5,066	951,756
1835	3,780	740,255	1,057	188,893	4,837	929,148
1836	3,845	772,046	1,465	255,875	5,310	1,027,921
1837	4,079	821,788	1,547	240,135	5,626	1,061,923

The number and tonnage of ships that cleared out from London to different parts of the world in each year from 1831 to 1837 have been as follows:—

	1831.		1832.		1833.		1834.		1835.		1836.		1837.	
To the United States of America ...	95	33,026	91	31,603	87	31,403	96	35,206	95	36,771	108	45,027	79	[illegible]
„ British N. Amer. Colonies...	248	75,905	215	65,016	219	65,753	234	75,693	282	89,089	256	82,578	220	[illegible]
„ Cape of Good Hope	25	5,012	29	6,131	28	5,638	36	7,097	26	5,242	47	10,291	45	[illegible]
„ Australian Colonies.........	65	24,008	73	25,964	67	21,502	74	24,576	84	30,056	91	32,202	100	[illegible]
Other parts........................	4,184	788,174	3,259	722,124	3,383	639,864	3,707	684,479	3,489	667,243	3,906	749,467	4,016	[illegible]
	4,612	926,125	3,667	850,838	3,784	764,163	4,167	827,051	3,976	828,401	4,408	919,565	4,460	902,922

The above figures exhibit an amount of activity in the prosecution of foreign trade wholly without a parallel, but these numbers are far exceeded by the coasting trade of the port. The number and tonnage of coasting vessels that entered London from other parts of the United Kingdom, distinguishing those engaged in the trade with Ireland, during the six years from 1833 to 1838, were as under:—

Years.	General Coasters, including Colliers.		Irish Traders.		Total.	
	Ships.	Tons.	Ships.	Tons.	Ships.	Tons.
[illegible]	[illegible]	[illegible]	1,094	148,568	19,338	2,517,221
[illegible]	[illegible]	[illegible]	1,043	147,962	20,069	2,593,857
	[illegible]	[illegible]	1,163	[illegible]	20,471	2,764,982
	[illegible]	[illegible]	1,048	154,009	20,765	2,810,879
	[illegible]	[illegible]	1,121	167,882	21,322	2,911,736
	[illegible]	2,727,741	1,239	180,435	21,582	2,908,176

It is not possible to form any reasonable estimate of the quantity of merchandise brought by canal and by land-carriage to London or which is by the same means conveyed thence to the interior of the kingdom, but it must be very great. There is not a town or village of any note in the midland districts which does not keep up a constant commercial intercourse with the metropolis by means of boats or waggons or both, but nothing is known concerning the quantity of goods transported. It would be easy for the proprietors of canals to give an account of their traffic, but all information of this kind is systematically withheld, probably through the fear of exciting competition. The value of foreign and colonial produce and merchandise constantly in the warehouses of the great docks is very great, but as no accurate account of the quantities remaining has been taken at any time since the commencement of the warehousing system, it is not possible to give any more definite information on the subject. [Docks.]

The amount of postage collected in London in each year from 1832 to 1837 was as follows:—

		£	s.	d.			£	s.	d.
1832	.	585,596	17	8	1835	.	634,180	1	2
1833	.	642,571	0	7	1836	.	699,309	19	1

During this time there has been no increase in the rate of postage, and the progressive increase in the amount collected is probably not more than equivalent to the increase of inhabitants. The above sums form between a fourth and a third part of the gross produce of the post-office duty in the United Kingdom. The post communications between London and various parts of the United Kingdom have been greatly accelerated by means of the different lines of railway already opened, and as the system is extended, greater improvements in this respect will of course be realized. At present the letter bags which leave London at eight o'clock in the evening arrive at Edinburgh early on the second morning. Letters for Liverpool despatched at the same time are delivered by eleven o'clock the following morning.

Steam-Vessels.—There is no port in the Kingdom which has profited more than London through the application of steam to navigation. A great part of the steam-vessels that arrive and depart carry passengers only, and are therefore not required to make entry at the custom-house, and with regard to such as carry goods no distinction is made at the custom-house between them and sailing-vessels, for which reasons no accurate account of the number of this class of ships that enter and leave the port can be given. Steam passage-boats are passing and repassing at all hours during the day between London and Greenwich and Woolwich, and others start every quarter of an hour during the day from London Bridge and Westminster. To Gravesend boats go at various times during the day, and in the summer there are several departures and arrivals every day to and from Margate and Ramsgate. Between London and Calais, Boulogne, Antwerp, and Rotterdam steam-vessels are passing almost daily in summer and frequently in winter. With various ports in England, Scotland, and Ireland, a constant intercourse is kept up in the same manner.

LONDON CLAY. The most considerable of the tertiary formations of Great Britain is thus designated, from its development in the valley of the Thames under and around the metropolis. It may be viewed in three parts, occupying the following series:—

Upper part.—'Bagshot Sand,' in which several remarkable fishes have been lately noticed by Dr. Buckland.

Middle part. 'London Clay.'—Containing a few bands of sand, nodules of septaria, and multitudes of marine shells.

Lower part, 'Plastic Clays and Sands.'—Various coloured clays and sands, with lignite, and marine, estuary, and fresh-water shells.

LONDON, NEW. [CONNECTICUT.]

LONDONDERRY, a maritime county of the province of Ulster in Ireland, bounded on the north by the Atlantic Ocean, on the east by the county of Antrim and a portion of Lough Neagh, on the south by the county of Tyrone, and on the west by the county of Donegal. According to the map of Ireland published under the superintendence of the Society for the Diffusion of Useful Knowledge, it lies between 54° 38′ and 55° 12′ N. lat., and between 6° 28′ and 7° 22′ W. long.; and, according to the map of the Ordnance Survey of Ireland, extends from the Tyrone boundary at New Bridge on the Ballinderry river on the south to Portrush on the north, 40½ statute miles; and from the Donegal boundary near Londonderry on the west, to the Antrim boundary at Kilrea Bridge on the east, 34 statute miles. The area, according to the same map, consists of—

			Acres.	r.	p.
Land	.	.	507,997	1	27
Water	.	.	10,404	0	3
			518,401	1	30

or 810 square statute miles. In 1831 the gross population was 222,012.

The county is of an irregularly triangular area, of which the eastern side may be considered as formed by the shore of Lough Neagh and the line of the river Bann, the south-western by the Tyrone boundary, and the north-western by the river Foyle and coast-line. From the Bann the surface gradually rises westward for about ten miles, forming a chain of elevations which bound the valley of that river on the west, and constitute the most remarkable feature of the interior of the county. These heights slope with a gentle declivity eastward and northward, but present steep and often precipitous escarpments towards the west, in which direction they overlook an extensive tract of undulating country extending from their bases to the eastern shore of Lough Foyle, and bounded on the south by the mountain range which separates the counties of Londonderry and Tyrone. Between the southern extremity of the first-mentioned range and the shore of Lough Neagh a comparatively level tract is interposed. The country between the rivers Bann and Foyle may thus be conveniently considered as divided into the district of the Bann, the district of Lough Foyle, and the district of Lough Neagh.

The Lower Bann, from Lough Neagh to the sea, a distance of upwards of thirty miles, has a fall of only 48 feet. The sea flows up to the Cutts above Coleraine, a distance of six miles, between low banks, which are encumbered towards the mouth of the river with extensive levels of sand. The north-western liberties of Coleraine here occupy an irregular semicircle of about four miles in radius, surrounding the town (COLERAINE) on the eastern side of the river. The general characteristics of this district are similar to those of the north coast of the county of Antrim. The elevations are however inconsiderable, and the general aspect of the country is tame and bleak. On a low rocky peninsula at the extreme north-east of the county is the thriving town of Portrush; and nearer the Bann, on an exposed strand running down between low headlands of basalt is Port Stewart, a well built and fashionable watering-place, but quite unprovided with shelter for any craft above the size of a fishing boat. West of the sand-banks which occur at the embouchure of the Bann the coast has a bolder outline, rising in a series of precipitous cliffs over the sandy beach. These cliffs extend a distance of rather more than two miles, increasing in height as they trend westward, until at the north-western extremity of the basaltic tract, of which they form the northern boundary, they have an elevation of from 350 to 400 feet. At this point the escarpments which mark the western boundary of the basaltic area commence, and may be traced along the brows of all the heights which have been mentioned as overlooking the district extending from this line to Lough Foyle. Of these heights the most prominent are Benyevenagh, at the northern extremity of the range, which rises abruptly over the sandy flat of Magilligan to a height of 1260 feet; Donald's Hill, nine miles farther south, 1315 feet; Benbradagh, three miles south of Donald's Hill, 1531 feet; and, separated from Benbradagh by the bold amphitheatrical valley of Glenshane, the upper or eastern boundary of which is formed by Carntogher mountain, 1521 feet high, is Craignashock, 1773 feet, with its subordinate heights of Altaghish, 1261 feet, and Tounmaran, 1272 feet, which together form the south-western extremity of the basaltic area, and complete a nearly continuous range of mountain of 24 miles in length from north to south. With the exception of some small streams which form striking cascades in falling over the escarpments of Avish and other minor heights north of Benyevenagh, all the waters which rise in the area included between the western fronts of the above-mentioned mountains and the river Bann take their course in the direction of the latter river. Of these the most considerable are the Macosquin and Agivey rivers, the former of which has its sources in the *slack*, as mountain-passes are here provincially termed, between the mountains of Benyevenagh and Keady, and the latter of which unites the waters of several streams descending from the range of Donald's Hill and Benbradagh. On the road leading from Kilrea on the Bann, westward through the *slack* separating the Donald's-hill range from the group of Benbradagh and the other mountains, which on this side form the valley of Glenullar, is the town of Garvagh. The Clady river, rising from the eastern declivities of Carntogher mountain, also joins the Bann at Portglenone, a point of considerable intercourse between the counties of Londonderry and Antrim. South of this the drainage of the county is towards Lough Neagh, through the rivers Moyola and Ballinderry, the latter of which forms part of the county boundary on this side. The Moyola has its rise at the bases of the mountain groups which form the head of Glenshane and the valley of Ballynascreen, and carries a considerable body of water to Lough Neagh, which it enters at its north-western extremity. The town of

Maghera is situated about midway between the Clady and Mayola rivers, on the road westward from Toome, at which latter place the Lower Bann first issues from the lake. The towns of Castle Dawson, Magherafelt, Tobermore, and Moneymore are situated in the open country between the Moyola and the Ballinderry rivers. This tract is bounded westward by the detached mountain of Slieve Gallion, which rises to the height of 1739 feet, and is in its structure similar to the mountains of the basaltic tract abovementioned, although throughout the wide intervening valley of Ballynascreen there are no traces of any connecting formation. West of the valley of Ballynascreen commences a mountain-chain which with little interruption extends to the valley of the river Foyle, forming the boundary between the counties of Tyrone and Londonderry. The highest of the group is Sawell, which rises to a height of 2236 feet, about midway between Slieve Gallion and the western extremity of the chain. The other chief heights on the range are Muinard, east of Sawell, 2057 feet; Dairt mountain, west of Sawell, 2037 feet; Finglen, east of Muinard, 1875 feet; and Slieve Kirk, which forms the western extremity of the range, 1224 feet. The district included between these mountains and Loch Foyle, constituting the western division of the county, is divided by a central tract of high land into the valleys of the rivers Roe and Faughan. The former, rising in the upper part of Glenshane, is joined by the Owenreagh and Owenbeg rivers at the entrance of that valley, from which it pursues a northern course nearly parallel to the line of abrupt declivities terminating the basaltic region, to Loch Foyle, which it enters by a sharp turn to the west immediately under the base of Benyevenagh. Several streams join the Roe from the comparatively level tract interposed between it and these mountains, rendering it, next to the Foyle and Bann, the most considerable river of the county. The valley of the Roe, especially towards the embouchure of the river, is flat and open, and contains much good and highly improved land. The thriving town of Newtown Limavady is situated on this river about five miles above its mouth, on the high road between Coleraine and Londonderry city, next to which places it is the most important town of the county. Dungiven, also a place of some consequence, occupies a romantic site on the same river near its junction with the Owenreagh, in the opening of the valley of Glenshane. The principal roads from the east to the west of the county pass through these towns, which severally occupy points at which the leading mountain-passes converge. The open rich country of this valley, called Moyroe, or the plain of the Roe, extends westward along the southern shore of Loch Foyle by Muff, and at the lower extremity of the loch opens into the valley of the Faughan. The Faughan river, which springs from the northern declivities of Sawell, after skirting the bases of the several mountains which extend from that point westward and northward to within two miles of the Foyle, makes a sharp turn to the east of north, and runs through a highly improved open valley to Loch Foyle. From the village of Claudy, situated near the sources of the Faughan, to the point where the river turns northward, a distance of twelve miles, the valley is occupied by well-improved grounds and numerous bleach-greens. The fertile vales of Bond's Glen and Glenrandle open from between the mountains forming the county boundary on this portion of the valley of the Faughan. The district between the valleys of the Roe and Faughan is considerably encumbered with moor and mountain. Legavannon, the principal eminence, which occupies nearly the centre of the tract, has an elevation of 1269 feet. Other heights, varying from 600 to 900 feet, spreading southward and westward from Legavannon, form the valleys of Burntolloght and Faure, from each of which a considerable stream descends to the Faughan.

Between the Lower Faughan and the Foyle is a range of undulating ground crossed by a valley through which the high road from Dungiven is carried to the village of Waterside; from thence a wooden bridge completes the communication with Londonderry city. The city of Londonderry occupies a boldly rising ground on the west bank of the Foyle, along which the county embraces an irregular tract extending from about four miles above the city to a mile below Culmore, where the river expands into Loch Foyle. The distance from end to end of this out-lying portion of the county is ten miles, and its breadth from one to three and a half. It is all arable and in a good state of improvement, as is also the opposite bank of the river. The Foyle here makes a noble appearance, varying in breadth from 300 yards to half a mile, and being capable of floating ships of 800 tons up to the bridge of Londonderry.

The most remarkable feature of the coast-line is the tract which extends from the north-western extremity of the hilly region to the low point of Magilligan and southward to the mouth of the Roe. On this tract is measured the base-line of the trigonometrical survey of Ireland now going on under the superintendence of the Ordnance, 53,200 feet in length. The same tract appears to occupy the greater portion of the bottom of the loch, and rises towards its centre in a bank which confines the navigation to that portion of Loch Foyle lying along the coast of Donegal. The length of the loch, which is of a triangular shape, bounded by the low coast of Londonderry on the east and south, and by the bold shore of Ennishowen on the west, is above 18 miles, and its greatest breadth 10. The entrance to the loch, between Magilligan Point and Ennishowen Head, is about a mile across, and from this point to Londonderry city is a safe and tolerably sheltered navigation of 23 miles. Eastward of the entrance is a shoal called the 'Tuns,' which renders the loch difficult of access in stormy weather. The safer channel is by the western side of this shoal. Except the small and at present inconvenient harbour of Portrush, there is no other shelter for vessels on the coast of this county. It has been proposed to render the Bann navigable from Loch Neagh to the sea by deepening the channel at Toome, and clearing away the ledges of rock which cross it at Moyvannagher, Portna, and the Cutts. There is however an extensive sand-bar at the mouth of the river, which could not be kept open without constant dredging. Under these circumstances Portrush is likely to continue the port of Coleraine.

The roads throughout the county are in general excellent. The immediate valley of the Bann and the district of Loch Neagh in particular are closely intersected with lines of communication. The western district is not so well opened. The chief lines here are those connecting Newtown Limavady by the southern shore of Loch Foyle and the valley of the Lower Faughan with Londonderry, and that which runs by the Upper Faughan from Dungiven to the same place. One road only crosses the rough country interposed between these lines. The valley of the Roe is well provided with roads, which extend southward by Banagher to Clady, giving ample means of communication to the country between the heads of the rivers Roe and Faughan. The communication southward is chiefly by the valley of the Foyle on one side, and by the head of the valley of Ballinascreen on the other. Besides these there are several passes from Tyrone into Londonderry among the mountain groups which lie between these points.

By a rain-guage, kept with great care at Londonderry, it appears that the maximum annual quantity of rain, on an observation of seven years, was somewhat less than 35 inches, the minimum somewhat less than 26 inches, and the mean 31·1 inches. From the same observations it appeared that on an average of seven years there were in each year 1[illegible] days fair, 202 showery, and 34 wet. The climate is by no means favourable to early sowing. The frequency of the showers, rather than the quantity of rain, renders the air more humid than in many districts where a greater quantity of rain falls.

Geology.—The basaltic tract corresponds in all respects to the remainder of the field on the opposite side of the Bann [GIANTS' CAUSEWAY], with this remarkable difference, that the dip of the strata is reversed; the surface, and the masses which compose it, on the Londonderry side of the Bann dipping towards the north-east, whereas their direction on the Antrim side is nearly to the south-west. The basalt, as in Antrim, attains its greatest thickness at the northern extremity of the field, the cap of Benyevenagh measuring upwards of 900 feet. Chalk, lias, limestone and red sandstone, succeed in descending order, one or more of the members being frequently absent, and constitute the remainder of the system, which throughout reposes immediately on the primitive rock. The geological structure of the district may thus be described as a floor of primitive rock overlaid in part by a field of secondary formations, capped by basalt. The boundary line is marked by the abrupt declivities forming the eastern limit of the valley of the Roe from the southern extremity of this range it passes across the Mayola river to the east of Slieve Gallion, and so to Loch Neagh, on the opposite side of which it reappears at the mouth of the Glenavy river. The main constituent of the rest of the county is mica slate. This rock covers about 450 square statute miles of the surface of Londonderry. In general the line of demarcation between it and the red sandstone, which is the most prominent member of the secondary field, is well defined. One mass however, that of Coolcoscrahan mountain, which rises nearly 1300 feet above the level of the sea, is wholly composed of this rock, although almost surrounded by the advanced basaltic heights of Craignashook and Benbradagh. Upwards of two-thirds of the mica slate of this district belong to the talcose variety. Primitive limestone is of frequent occurrence throughout this field. At a height of 800 feet above the sea, on the north-west side of Carntogher mountain, it is found with veins of coloured spar, quartz, and green chlorite. It also occurs near Dungiven and Claudy. On the east side of Slieve Gallion there is a granular limestone, which contains quantities of crystallized hornblende: hornblende slate is found at several places in the valley of the Roe; a bed, four hundred yards in extent, occurs near the old church of Dungiven, where it runs parallel to the bed of primitive-limestone above mentioned. The structure of the south-eastern extremity of the county is more complex. Slieve Gallion, besides having a cap of basalt, with the usual underlying formations, exhibits towards its base beds of sienite in connection with porphyry. On the north-west side the sienite verges into greenstone. Several masses of greenstone, unconnected with the tabular basalt of the summit, also crop out on the east side of the mountain. All along the western verge of the basaltic region the red sandstone, which forms the lowest member of the field, projects beyond the superior strata in a belt varying from one to two miles in breadth. This is the surface rock of the eastern valley of the Roe, from the head of which it sweeps across the opening of the valley of Ballinderry, and so between Slieve Gallion and the line of basalt into Tyrone. A detached patch of floetz limestone occurs near the outer edge of the sandstone field at Desartmartin, on the north-east of Slieve Gallion, where it is worked for burning. There are no mines worked in this county.

Soil, Agriculture, and Trade.—The soil of that part of the valley of the Bann where the subsoil is hard basalt consists for the most part of a rusty loose grit, without sufficient strength or cohesion for wheat crops. Numerous tracts of bog, interspersed with shallow pools, and frequently separated by craggy knolls of basalt, are scattered over this part of the county. There are however tracts of good land along the banks of the several rivers which traverse the district, and especially at their junctions. In general these superior portions consist of rolled gravel banks: clayey tracts occur in the neighbourhood of Coleraine, beyond which, on the Antrim side of the river, the basaltic soil is of a better quality than in the rest of the tract. The same characteristics mark the basaltic field in the district of Loch Neagh; but between the basalt and the primitive district farther west is a tract of rich open country, extending southward into Tyrone. This is the most extensive tract of good ground in the county. The soil of the basaltic field towards its western border is of a better description than in the immediate valley of the Bann and Loch Neagh. The basalt is here copiously intermixed with zeolite, which renders its detritus comparatively fertile. A soil of this kind covers the summits of Benyevenagh and Benbradagh, forming extensive tracts of sweet pasture. The subjacent valley of the Roe possesses a variety of soils, all of a superior kind. The rich flat of Moyroe, extending from the base of Benyevenagh across the opening of the valley, consists of alluvial deposits, which form a deep loamy soil of considerable strength and fertility. A strip of loamy land, also of alluvial origin, accompanies the windings of the river as high as Newtown Limavady. High gravel banks, rising in a natural terrace on each side beyond these flats, mark the more immediate valley of the river throughout the greater part of its course: The soil of these banks is generally a fertile though not very rich loam. Beyond the eastern terrace commences a tract of red clay, arising from the decomposition of the sandstone, which at this side forms the surface-rock up to the immediate acclivities of the mountains. This clay contains extensive beds of marl, and with good treatment bears excellent grain crops. The schistose district, lying between the valleys of the Roe and Faughan, is to a great extent moory and mountainous. The valleys of Faughan-vale and Muff-glen, running southward from the open tract along the margin of Loch Foyle into the schistose region, have good tracts of fertile land, composed of a mixture of gravel, loam, and strong clay. The main valley of the Faughan river is in its structure and soil similar to the western half of the valley of the Roe, having gravel terraces reaching back to the schistose region at each side. These are well cultivated, and towards the lower part of the valley spread over a considerable tract. Gravel and mica-slate are also the chief constituents of the soil on the opposite bank of the Foyle. A cold blue clay occurs here in a few detached spots. The best improved portions of the county are the district of Loch Neagh, the valley of the Roe, the valley of the Faughan, including the coast of Loch Foyle, between the embouchures of these rivers, and the immediate vicinity of Londonderry on both sides of the Foyle. There is a very general scarcity of timber. The chief mansion-house in the county is that of Down-hill, the residence of Sir James Bruce, Bart., built by the late earl of Bristol, bishop of Derry. It is an imposing architectural pile, situated on the brow of the basaltic field where it rises over the sea, about a mile and a half west of the mouth of the Bann. The cliffs immediately behind the house rise upwards of 100 feet above the beach, and the situation is so bleak that planting could only be effected in the deep ravines which surround the demesne on the land ward side. There is here a splendid collection of paintings by the old masters, and of other articles of virtù, removed from the galleries at Ballyscullion when the palace erected by the same prelate there was taken down. Ballyscullion house, as it stood in 1802, was by much the most magnificent residence in the north of Ireland. The situation, on the bare flat near the point where the Bann issues from Loch Beg, was however extremely unfavourable to the formation of a demesne corresponding to the magnificence of the building. The house was accordingly taken down on the death of the earl, and the materials sold.

The progress of agriculture in this county has been materially forwarded by the establishment of an agricultural school near Muff by the company of grocers of London, who here hold large estates under the crown. There are 130 acres of land attached to the school, for experimental farming; a classical school is likewise connected with the establishment. Oats and barley are the principal grain crops. The system of greencropping is practised by the gentry only. There is but little land in pasture, and the breed of cattle, with the exception of pigs, of which great numbers are reared, is in general not much attended to. The following table exhibits the quantity of grain sold at the chief market-towns, exclusive of Londonderry and Coleraine, in the years 1830 and 1835:—

	Wheat. (tons.)		Oats. (tons.)		Barley. (tons.)		Bere. (tons.)	
	1830.	1835.	1830.	1835.	1830.	1835.	1830	1835.

The condition of the labouring population is superior to that of the same class in most parts of the north of Ireland. The general rate of wages for agricultural labourers is 1*s.* per day for 180 working days in the year. The population are to a considerable extent of Scottish and English descent. Their dwellings and persons are distinguished by a superior air of comfort. Those of the native race occupy the more mountainous and remote districts; they are a simple and interesting people, preserving vivid traditions of early times, and are generally on the most friendly terms with the rest of the population. The Irish language is very commonly in use among them.

The manufacture and bleaching of linens is the staple trade of the county. The most extensive bleach-greens lie along the rivers Roe and Faughan, on the latter of which there is abundant water-power and numerous sites admirably calculated for this branch of the manufacture. In 1831 there were in the county 2543 weavers, 46 reed makers, 258 flax-dressers, 21 bleachers, 64 cotton-spinners, 3 brewers, 1 distiller, 6 maltsters, 153 coopers, 53 hatters citizens, their charter was renewed by letters patent of the 6th April, 1662, and the city again began to prosper. About 1685 however a great decay took place in trade and commerce, and two years after, on a *quo warranto* brought against the corporation by the government of King James II., the corporation were deprived of their charter. The subsequent proceedings of the government excited universal alarm among the Protestants of Ireland, and a report of an intended massacre having reached the city in the latter end of the year 1688, decided the inhabitants on refusing admission to Lord Antrim's regiment, which had been despatched by the lord-lieutenant Tyrconnell to garrison the place. The gates were closed by some resolute young men of the town, on the 7th of December, just as the advanced guard of the king's forces appeared on the opposite side of the river. The northern Protestants now generally took arms, and Derry became their principal rendezvous. Lord Mountjoy, a Protestant nobleman, holding a commission in the army of King James, was, with some difficulty, admitted by the citizens, who stipulated that one-half of any force he might introduce should be Protestants, and that until their apprehensions should be allayed by a pardon for the late commotion, the citizens themselves should keep the guards. In the meantime arms and ammunition were provided, and applications for assistance urged on the London companies. Lord Mountjoy being despatched to Paris, the command was bestowed on Colonel Lundy, who professed himself strongly attached to the Protestant cause.

On the 12th March, 1690, King James landed at Kinsale, and immediately proceeded to Dublin, where it was resolved to make the reduction of Derry the object of the army's first operations. On the approach of King James, who proceeded on the expedition in person at the head of 20,000 men, Lundy declared the place untenable, and dissuaded some English forces which had just arrived in the bay from landing in the face of the superior force advancing against them. The citizens, indignant at his cowardice, rose tumultuously, seized the gates, and fired upon the advanced guard of the Irish. Lundy having fled from the city in disguise, the citizens elected two new governors, Walker, rector of Donoghmore, and Major Baker, and formed themselves into eight regiments, amounting to 7020 men and 41 officers. Eighteen clergymen of the establishment and seven dissenting ministers, laying aside all sectarian animosities, joined their ranks. The besiegers having seized the fort of Culmore, erected batteries on both sides of the river, and stretched a boom across for the purpose of preventing the arrival of supplies. They then proceeded in their operations against the city by regular approaches on the western side, and pushed some of their works close to the foot of the rampart. The citizens conducted their defence by a vigorous fire from the walls, and by irregular sallies, which were generally attended with success. After the first eleven days of the siege, King James withdrew, leaving the command to Marshal Rosen. On the 30th July, after the inhabitants had been reduced to the necessity of eating dogs, horseflesh, hides, and tallow, and when even these were failing, two ships laden with provisions and convoyed by an English frigate entered the bay. The foremost victualling ship, after passing Culmore and the batteries on either side uninjured, struck the boom and broke it. The siege, which had lasted 105 days, was immediately raised. The garrison lost 3200 men; and, of the 4300 who remained, more than 1000 were unfit for duty. The loss of the besiegers, between the number slain in the siege and retreat, and those who died from disease in their camp, was 8000. On the representations of the heroic Walker, the twelve London Companies advanced 100*l.* each for the repair of the city; wood was supplied by the Society, abatements made in the rents, and the terms of many leases rendered more favourable to the tenants. The town-hall, which had been destroyed during the siege, was rebuilt in 1692. In 1789 a wooden bridge was commenced over the Foyle, where, previously, the only means of passage had been a ferry. The architect was Lemuel Cox, an inhabitant of Boston in New England. The original expense was 16,294*l.* 6*s.* 0*d.* Two years completed the work, which, having been frequently repaired at an expense rather greater than the original cost, is still standing. The length is 1068 feet, and the breadth 40. A turning bridge near the western end of the structure admits the passage of vessels up the river. The greatest depth of the Foyle here at low-water is 31 feet, and the rise of the tide is from five to nine feet. The depth of water at the quays is from 12 to 14 feet at low-water of neap tides. The velocity of the current is from three to four miles an hour in the narrowest part of the channel, and from two to three in the widest.

The charter of the corporation bears date the 11th Jan., 18 Car. II. The governing body is the common-council, consisting of 12 aldermen, including the mayor, 24 chief burgesses, and two sheriffs. The mayor is chosen by the common-council from the aldermen. The freedom is acquired by birth, servitude, marriage, and special favour. The recorder is presented by the corporation and appointed by the crown. The city sessions, to hear and determine felonies, are held three times in the year. A court of record, with civil jurisdiction, unlimited in amount, is held before the mayor or recorder once a week. With the exception of the rent of the market tolls, amounting to 170*l.* per annum, the corporation do not now possess any property not held for special public trusts. In Feb., 1833, they owed a total debt of 66,444*l.* 17*s.* 6*d.*, of which 34,690*l.* 9*s.* 11½*d.*, was paid off by a sale of their then remaining property. The balance due has since increased to 32,971*l.* 7*s.* 6½*d.*, to pay which there are not now any funds, save the above rents, available.

Prior to the Union, Londonderry city returned two members to the Irish parliament. Since that time it is represented by one member only. The franchise is now in the 10*l.* householders and freemen. On the 1st *April*, 1835, the constituency consisted of 724 electors.

The general appearance of the city is highly imposing. The hill on which it stands rises boldly over the Foyle, the banks of which on both sides are steep and wooded. On the summit of the hill, 119 feet above the level of the river, is the cathedral, the spire of which rises to the height of 178 feet from the churchyard. Walker's testimonial—a fluted Doric column, 90 feet high—springs nearly from the same level on the central western bastion. These objects, with the cupola of the town-house, give a very striking outline to the mass of buildings which stretches from the water's-edge up the northern and eastern acclivity of the hill, and spreads westward into an extensive suburb occupying the lower part of the valley which separates the hill and site of the old town from the adjoining eminences. The bishop's palace stands within the walls at the south-western extremity of the town, near the cathedral. Between the cathedral and palace is the court-house, a very handsome edifice, exhibiting a façade of 126 feet, consisting of an Ionic portico of four columns with wings adorned with Doric pilasters, and surmounted by statues of Peace and Justice. The building was commenced in the year 1813, and cost 30,479*l.* 15*s.* Outside the walls, on this side, is the county gaol, a very spacious and strong building, completed at an expense of 33,718*l.* (Irish) in the year 1824. The crown-prison department is somewhat too extensive for the demands of justice in so peaceable a county. Outside the walls, at the opposite extremity of the town, facing the river, is the custom-house, a hollow square of buildings, 170 feet by 130. The quays extend from the bridge northward for rather more than half a mile, and terminate in a patent slip, constructed in 1830 at a cost of 4000*l.* This slip is found to answer all the purposes of a dry-dock for vessels of 300 tons register. A general ship-yard is attached, in which vessels of 200 tons and upwards have been recently built. The walls and ramparts are still kept in repair, and form an agreeable promenade for the citizens. Between 1803 and 1808 the three principal gates were built at a cost of 1403*l.* 3*s.* Bishop's-gate, which forms the entrance at the side occupied by the cathedral and court-house, is a handsome triumphal arch with lateral passages, erected by the corporation in 1789.

The lighting, cleansing, and watching of the city are managed by a committee under the act of 2 and 3 Wm. IV., c. 107. The gas-works which supply the city were established by a joint-stock company in 1830, at an expense of 7000*l.* The supply of water is from a tank on the opposite side of the river. The water is conveyed across the bridge by pipes which close by the operation of the same machinery that opens the turning platform in the bridge for the occasional passage of vessels. Turf-fuel is procured from the bogs of Clondermot, on the eastern bank of the Foyle. The quantity of coal and culm imported in 1835 was 13,966 tons, of the value of 8728*l.*

The port is under the control of a committee acting under the provisions of the 2nd and 3rd Wm. IV., c. 107, which act also regulates the tonnage duties. The quays, which up to 1831 were the property of the corporation, are now in the hands of private individuals and companies. There are twenty-one such quays and wharfs, including two on the waterside bank of the river. The shipping belonging to the port in 1837 consisted of forty sailing vessels of an aggregate tonnage of about 6000 tons, and of six steamboats of an aggregate tonnage of 1063 tons.

The number of vessels employed in the foreign trade which entered inwards in 1837 was forty-six, of an aggregate tonnage of 8385 tons; outwards fifteen, of an aggregate tonnage of 4886 tons. Coastwise, in the same year, the number inwards was 687, and the tonnage 79,935 tons; outwards 543, tonnage 66,260 tons. These returns, compared with those of 1826, exhibit a considerable decrease in the foreign trade; but a much more than corresponding increase in the trade coastwise, which, within the last ten years, has more than doubled.

Exports of Londonderry in the year 1835 (*exclusive of re-shipments of Sugars*).

In the same year the imports amounted to an estimate value of 708,054*l*. The chief articles were sugar, 58,744*l*.; iron, 24,520*l*.; British spirits (chiefly Scotch whiskey), 21,820*l*.; tea, 19,255*l*.; flax-seed, 16,896*l*.; haberdashery and apparel, 13,550*l*.; fish (chiefly herrings), 10,811*l*.; tallow, 9570*l*.; glass and earthenware, 8980*l*.; tobacco, 8213*l*.; and coal and culm, 8728*l*. The customs of the port for the year 1837 amounted to 99,652*l*.

It is estimated that the quantity of goods of all kinds carried annually into the city by inland conveyances is 58,400 tons, of which 37,000 tons are for exportation; and that the total quantity of goods carried out of the city is 67,500 tons, of which 54,400 tons consist of goods imported. The grinding of grain (chiefly oats) is the chief branch of manufacture carried on in the city and suburbs. There are two extensive distilleries, a brewery, copper-works on a large scale, and a metal foundry. In these seven steam-engines are employed, of an aggregate of 116 horse-power. The salmon fishery of the Foyle gives employment to 120 men besides water-keepers. The fish are exported to Liverpool, Glasgow, Bristol, and Dublin, in boxes, packed with ice. The produce has increased greatly within the last ten years, in consequence of the introduction of stake-nets. In 1835 the total number of fish taken in stake and draught nets in the Foyle was 55,906, weighing 143 tons 9 cwt. This fishery belongs to the Irish Society.

In 1618-19 the total number of houses in the city was 92, inhabited by 102 families; in 1814 the number of houses was estimated at 1458, and of inhabitants at 10,570; in 1821 the number of houses was found to be 1329, and of inhabitants 9313. In 1831 the numbers were—houses 1405, inhabitants 10,130, comprising 1972 families: of which number 34 families were chiefly employed in agriculture; 1297 in trade, manufactures, and handicraft; and 641 were not included in either class. According to the Report of the Commissioners of Public Instruction, the numbers in 1834 were—

Within the walls . . .	2,121
Without the walls . .	11,164
	13,285

and these appear to be still increasing.

There were, in 1836, in the city, suburbs, and liberties, 31 daily schools, supported wholly by the pupils, educating 748 males and 564 females; and 12 daily schools, supported wholly or in part by contributions and bequests, educating 680 males and 584 females. Gwyn's Charitable Institution has an income of 1870*l*. 13*s*. per annum; in 1836 there were 81 boys on the establishment. The Diocesan and Free Grammar-school has an income of 600*l*. per annum, 567*l*. 6*s*. 2*d*. of which is contributed by the London companies, the Irish Society, and the bishop. The Irish Society also contributes to the support of eight other schools. Two schools, in 1836, were in connection with the National Board of Education. In the city is a public library and news-room, with a collection of about 300 volumes, established in 1819, and in 1824 transferred to a new building now partly occupied by the Chamber of Commerce. There is also a literary society, established in 1834. The savings'-bank, established in 1816, had deposits amounting to 16,226*l*. 15*s*. 6*d*. on the 10th Nov., 1835. The number of depositors was 699. Two weekly newspapers are published in the city.

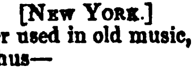
Of the charitable institutions the principal are:—the Mendicity House, established in 1825 by Bishop Knox, and supported by voluntary donations averaging 600*l*. per annum; the Poor-Shop, established in 1821 to provide the indigent with clothing and bedding at prime cost, supported by contributions averaging about 45*l*. annually; and the Ladies' Penny Society, established in 1815, for the relief of sick and indigent room-keepers, supported by subscriptions averaging 200*l*. per annum. There are also a charitable loan-fund, a penitentiary for females, and some minor charities. The district lunatic asylum stands on the north of the city. It was opened in 1829, at a cost of 25,678*l*. 2*s*. 4*d*., and is calculated for 104 patients. The funds for its support are advanced by government, and repaid by the counties of the district. The county infirmary and fever-hospital, opened in 1810, and the dispensary, established in 1819, are supported by annual subscriptions and grand-jury presentments. The annual average of patients relieved in the former is 407, and of those relieved by the latter 1564.

(*Ordnance Memoir of the City and North-western Liberties of Londonderry*, 4to., Dublin, 1837; *Report of Railway Commissioners*, Ireland, 1838; Leland's *History of Ireland*, &c.)

LONG, ROGER, was born in the county of Norfolk about the year 1680. At the age of seventeen he entered Pembroke Hall, Cambridge, took the degree of Master of Arts in 1704, and that of Doctor of Divinity in 1728. The following year he was elected a Fellow of the Royal Society and Vice-Chancellor of the University; in 1749 he was appointed Lowndes' Professor of Astronomy, and in 1751 he was presented to the rectory of Bradwell in Essex, which he held until his death, 16th December, 1770. His principal work is a treatise on astronomy, in two large quarto volumes, the first of which was published in 1742, the other in 1764: a second edition appeared in 1784. This work contains very good descriptions of the apparent motions of the heavens. Besides his astronomy he wrote, under the signature of Dicaiophilus Cantabrigiensis, a pamphlet entitled 'The Rights of Churches and Colleges defended,' 1731, 'Reply to Dr. Gally's pamphlet on Greek accent,' 1755; 'Life of Mahomet,' prefixed to Oakley's 'History of the Saracens,' 1757; 'Music Speech spoken at the public commencement, July 6, 1714,' and other poems, London, 1719, to which is prefixed a short notice of the author's life. With a view to popularise the science of astronomy, he caused to be constructed a hollow sphere, wherein thirty persons could sit conveniently, and on the inner surface of which was a representation of the heavens as they would appear to an observer in north latitude. The keeper of this sphere, who is generally an undergraduate, receives 6*l*. per annum. (*Cambridge Calendar*.) The habits of Dr. Long were peculiarly moderate, his ordinary drink being water; and for some years previous to his death he abstained altogether from eating animal food. By his will he bequeathed 600*l*. for the benefit of his college. (*Biog. Brit.*; *Memoir* of Dr. Wood mentioned above.)

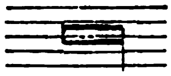
LONG ISLAND. [NEW YORK.]

LONG, a character used in old music, formed of a breve with a stem added, thus—



and equal in time, or duration, to two breves, or four semi breves, &c. It is rarely met with in compositions of later date than the middle of the seventeenth century, and is now hardly known, except to the musical antiquary.

Still more obsolete is the LARGE (a word omitted in its proper place), a character nearly in the above form, but the head is much more extended. Ex.·



This is the longest note ever used in musical notation, and equal to two longs, four breves, &c.

LONGFORD, an inland county of the province of Leinster in Ireland, bounded on the north-west by the county of Leitrim, on the north-east by the county of Cavan, on the south-east by the county of Westmeath, and on the south-west by the county of Roscommon, from which it is separated by a part of Loch Ree and the river Shannon. According to the map of Ireland published under the superintendence of the Society for the Diffusion of Useful Knowledge, it lies between 53° 29′ and 53° 56′ N. lat., and between 7° 19′ and 7° 56′ W. long. According to the map of the Ordnance Survey of Ireland, it extends from the Leitrim boundary at Gulladoo Loch on the north to the Westmeath boundary on the south, 29 statute miles, and from the Shannon at Tarmonbarry bridge on the west to the Inny near Loch Kinale on the east, 22 miles. Its area, according to the same map, consists of—

	Acres	r.	p.
Land . .	255,734	1	10
Water .	13,675	0	23
Total . .	269,409	1	33

or 421 square statute miles nearly. In 1831 the total population was 112,558.

The general slope of the surface is westward and southwestward towards the Shannon, except in the north-eastern angle towards Cavan, where the county embraces a small portion of the basin of Loch Erne. This district, forming the immediate basin of Loch Gownagh, is separated from the remainder of the county by a slightly elevated tract upon the south, and by a series of hills of low elevation on the west. The latter eminences range from 200 to 400 feet above the level of the lake, and form the eastern front of the Cairn Clonhugh group. Loch Gownagh is a very irregular piece of water extending from north to south five miles and a half, and from east to west nearly five miles, but from its being rather a collection of lakes communicating by narrow channels than one sheet of water, it does not in all cover more than about 3000 acres, of which 2278 acres are within this county. Its chief feeders are small streams running from the surrounding hilly country. There are several pretty wooded islands in the lake, and the shores are picturesque and in some places finely planted. The Cairn Clonhugh hills, extending about ten miles from north-east to south-west, occupy the greater part of the district between Loch Gownagh and the Shannon. The chief heights are Crott on the north-east (686 feet) and Cairn Clonghugh near the opposite extremity of the group (912 feet). The general character of these hills is tame and pastoral. They form the southern boundary of the district of Drumlish, a bare tract extending along the southern border of Leitrim, and watered by the Ballinamuck, or Clonard river, which rises from Loch Annagh, in the north of the Cairn Clonhugh hills. Ballinamuck is a small place, and much of the surrounding country is moory and barren: the surface improves towards Drumlish, which is a place of some trade in grain. The angle included between the Shannon and the river Rinn, which flows southward out of Leitrim [LEITRIM], is much encumbered with bog. Between the western termination of the Cairn Clonhugh hills and the Shannon is an open well-cultivated tract, in which the thriving town of Newtown Forbes is situated. Newtown Forbes lies about two miles eastward from the Shannon, which here spreads into a lake three miles long by from a mile and a half to half a mile in width, called Loch Forbes. The intermediate flat, being about two miles every way, is occupied by the extensive plantations of Castle Forbes, the seat of the Earl of Granard. The south-eastern slope of the Cairn Clonhugh hills forms one side of the immediate valley of the Camlin, a considerable river, which, taking its rise in the extreme east of the county, skirts the low range bounding the basin of Loch Gownagh on the south, whence flowing through the small lakes of Killeen and Ballinlough, it runs in a westerly direction, by a winding course of upwards of twenty miles, to the Shannon, which it enters two miles south of Loch Forbes, at Tarmonbarry. The country through which the Camlin flows is open and well improved. The southern bank of the river in particular is beautified by numerous seats and well planted demesnes. On the more elevated portions of the plain, between the sources of the river and Loch Gownagh, is the town of Granard. A little lower down the river is St. Johnstown. Nearer the Shannon is Longford, the assize town of the county, principally situated on the southern bank of the Camlin. Between Longford and the Shannon, the Camlin receives two considerable streams from the south, of which the Keenagh river is the larger. The district intercepted between the Keenagh and the Shannon, which along the south-western boundary of this county expands into the extensive lake of Loch Ree, is very flat and boggy. The arable portion of this district towards the Shannon is low, and along the shores of Loch Ree, which here forms the boundary of the county, is liable to extensive winter-floods. These inundations materially alter the appearance of the coast-line of the lake, submerging several large peninsulas and converting others into islands.

Next to the district of Ballinamuck, this is the least productive part of the county. Along the shore of Loch Ree there are however some handsome demesnes and good tracts of pasture-land. The towns are Cloondara, or Richmond Harbour, at the terminus of the Royal Canal, which traverses this part of the county in a direction nearly parallel to the Keenagh river; and Lanesborough, at the head of Loch Ree, where the Shannon is crossed by the road leading to Roscommon. An inlet of Loch Ree, running about four miles eastward from the main sheet of the lake, bounds this part of the county on the south. Near the shore, in this direction, are the small lakes of Derry and Derrymacar, the latter of which in winter becomes a portion of the enlarged sheet of Loch Ree. The level of Loch Ree in summer is 122 feet and in winter 129 feet above the sea at low water. At the head of the above-mentioned inlet is the confluence of the Inny, which, next to the Suck, brings down a larger body of water than any other tributary of the Shannon. Its sources are in the county of Cavan, where the streams which feed Loch Sheelin have their rise: issuing from Loch Sheelin, it passes through Loch Kinale at an elevation of 212 feet above the sea, in the eastern extremity of Longford; thence, forming for a few miles the boundary between Longford and Westmeath, it enters the latter county, where it expands into the beautiful lake of Derrevaragh; passing from which, through Loch Iron, it again becomes the county boundary for a few miles; then, running under the line of the Royal Canal at Quin's Bridge Aqueduct, near Abbeyshrule, it cuts off a small portion of the extreme south of Longford, and flowing westward, by Ballymahon, enters the Shannon at the head of the eastern inlet of Loch Ree. The valleys of the Camlin and Inny are separated by a low table-land, which rises into only one conspicuous eminence of 650 feet at Slieve Goldry. The remainder of this plain, especially towards the Inny, is much diversified by low ranges of eskers, similar in structure and direction to those of the south of the county of Leitrim. On the side of this plain, towards the Inny, are the towns of Ballymahon and Edgeworthstown. The neighbourhood of Ballymahon is the most highly improved part of the county, being in all respects similar to the rich plain of Westmeath, of which it is a continuation. The only striking natural feature in this part of the line is Glen Loch, a sheet of water about a mile and a half in length, south of Edgeworthstown. The stream issuing from it runs southward to Loch Iron and the Inny. There are numerous other small lakes throughout the county.

The Shannon, between the points where it becomes the boundary of the county, has a coast-line, including windings, of about fifty miles. Above Loch Ree there is no navigation by passenger-boats. The trade-boats plying on the line are barges of from thirty to fifty tons, drawing from 3½ to 4½ feet water. The freight, including tolls, is one penny per mile. The total amount of goods carried in both directions, in the year 1835, was 9770 tons, of which [illegible] tons consisted of grain. The Inny offers peculiar facilities for navigation; but as yet there has been no attempt made to remove the slight obstructions which prevent the ascent of boats. The Royal Canal entering the county at [illegible] nearly parallel to the Inny, turns northward at Ballymahon, from which its course is parallel to that of the Keenagh river. At Abbeyshrule, near where it enters the county, its elevation is 224 feet above the level of the sea, and at Cloondara, at its terminus, 139 feet. The intermediate descent of 84 feet is distributed over seven locks. A branch of six miles in length, on one level, is carried from the main line near Killashee, across the Keenagh and Ardagh roads, to Longford town, where it terminates in a small basin. Fly-boats for passengers have recently been established along the entire line to Dublin, which perform the trip from Longford to Dublin in fifteen hours. The time required by the slow passenger-boats is twenty-two hours. The principal goods conveyed on the Royal Canal are grain, potatoes, pigs and black cattle, turf, bricks, and small quantities of iron from the Arigna works, downwards; the return trade is chiefly in coals, merchandise, and manure. The trade-boats carry from forty to sixty tons, and draw 4½ feet water. The total number of passengers conveyed by fly-boats on the canal, for the year ending 1st of May, 1837, was 19,130, and by slow passenger-boats 28,330. At the time of this return the fly-boat system had not been extended beyond Mullingar. In the year 1837 the number of live pigs conveyed to Dublin by this canal was 33,349; of casks of butter, 3630; of tons of corn, meal and potatoes, 26,024; of tons of merchandise, 6247; of tons of coal and manure, 14,339; of tons of turf, 21,724; and of tons of stones, sand, flags, and bricks, 16,127: making a total tonnage of 84,461 tons, producing a total amount of toll of 10,941l. 16s. 5d. The country is in general well supplied with highways, which are kept in good repair by the county.

The climate is not so genial as that of the midland counties in general. There is a considerable extent of wet and marshy surface.

Geology.—The entire district south of the Camlin consists of the floetz limestone of the central plain, with the exception only of two patches of sandstone, one extending across the bed of the river Inny round Ballymahon, and the other constituting the mass of Slieve Golry, and extending northward to near the town of Longford. The immediate valley of the Camlin on its southern bank, and the entire tract extending northward from it to the county of Leitrim, consist of clay-slate, constituting a portion of the greywacke formation of Cavan. Between the western extremity of the clay-slate field and the limestone, which crosses the bed of the Camlin near its junction with the Shannon, and occupies the level country round Newtown Forbes, a belt of yellow sandstone and conglomerate intervenes: this last formation is in connection with a tract of a similar character in the south of the county of Leitrim. The eskers, or low gravel ridges, which occur so frequently throughout the southern and south-eastern parts of Longford, are also similar in character to those of the last-mentioned county. They contain large quantities of fine calcareous sand and marl. Marly clay also underlies many of the boggy tracts, in some places to a thickness of ten feet between the bog and the limestone rock; but in general the thickness of this bed of clay is one foot only. The average depth of the bogs is thirty feet: they contain the same vegetable matter and subsoil, and are reclaimable by the same means as those of the other midland counties.

A small tract, similar in character to the millstone-grit formation (LEITRIM), occurs near Lough Gowna. The iron-stone is said to be equal to the best Swedish ore, and to be associated with coal-shale; but the traces of coal in this district ought probably to be referred to the detritus of the coal-tract of Lough Allen. Lead ore has been found in the quarries in the limestone district, and exposed in the beds of streams, but no workings have hitherto been attempted. Marble is raised in the vicinity of Ballymahon: it is of a deep grey colour, and polishes well.

Soil, &c.—From the great quantity of bog and surface-water in the western part of the county, the soil in this district is not equal to that of the tract sloping towards the valley of the Inny. Here the characteristics of the limestone plain are found in a rich vegetable mould, producing either heavy grain crops or sweet fattening pasture. The rest of the county is chiefly grazing land. Great quantities of butter are made by the farmers and cottiers. *Pigs* are reared in great numbers. The feeding of sheep is not much attended to. The returns of the sale of grain in the several markets are very imperfect. About 15,000 barrels of oats are annually sold in the market of Granard, and about 9000 barrels at Edgeworthstown. At Ballymahon and Longford are also brisk markets for the sale of wheat, oats, and barley.

The condition of the working population is very low. Sixpence per day, for eighty working days in the year, is the amount of wages stated for agricultural labourers in this county, in the Appendix to the Report of the Commissioners to inquire into the Condition of the Poor in Ireland. The people live almost entirely on vegetable food: they are nevertheless strong and healthy; but want of regular occupation and insufficient returns for their occasional employment has added to a spirit of recklessness, the effects of which are apparent in the criminal returns.

The linen manufacture is carried on with some activity in the neighbourhood of Newtown Forbes, where the first Earl Granard took pains to introduce it. The manufacture of coarse flannels and friezes for home consumption is also attended to throughout the county. In 1831 there were in Longford 3 brewers, 104 coopers, 19 hucklers of flax, 15 tanners, and 651 weavers of linen and woollen fabrics.

The only seats of the nobility are Castle Forbes, the residence of the Earl of Granard, and Longford Castle, of the Earl of Longford. Carrickglass, the seat of the Lefroy family, near Longford, on the Camlin river, has an extensive demesne; so also have Clonfin, Lissard, Fox Hall, Doory Hall, Castlecore, and Newcastle, which three last are in the vicinity of Ballymahon.

Divisions, &c.—Longford is divided into the baronies of *Longford*, on the north-west, containing the towns of Longford (pop. in 1831, 4516), Drumlish (pop. 574), and Newtown Forbes (pop. 537), and the villages of Cloondra (pop. 214) and Ballinamuck (pop. 161); *Granard*, on the north-east, containing the town of Granard (pop. 2069), and the villages of Abbeylara (pop. 310), St. Johnstown (pop. 255), and Bunlahy (pop. 229); *Ardagh*, on the east, containing the town of Edgeworthstown (pop. 1001) and the village of Ardagh (pop. 142); *Abbeyshrule*, on the south, containing only hamlets; *Rathcline*, on the south-west, containing the town of Ballymahon (pop. 1961), and the villages of Lanesborough (pop. 320) and Keenagh (pop. 396); and *Moydow*, on the west and centre, containing the village of Killashee (pop. 231.)

Prior to the Union, Longford sent ten members to the Irish parliament; two for the county, and two for Longford, Lanesborough, Granard, and St. Johnstown, respectively. The representation is now limited to two members for the county. In 1837 the constituency consisted of 1298 voters. The assizes are held at Longford, and general quarter-sessions at Longford and Ballymahon.

The constabulary force on the 1st of January, 1838, consisted of 4 chief-constables, 29 constables, 117 sub-constables, and 8 horses; the cost of supporting which establishment was 5482l. 16s. 9d., of which 2676l. 13s. 10d. was chargeable against the county. The number of persons charged with criminal offences, who were committed to the county gaol in the year 1836, was 607, of whom 557 were males and 50 females, being in the proportion of one criminal offender in 185 of the entire population. The district lunatic asylum is at Maryborough, in Queen's County. The proportion paid by Longford towards the expense of its erection is 4087l. 8s. 2d. The county infirmary is at Longford, and there are dispensaries at Granard, Ballymahon, Edgeworthstown, and Keenagh. There are barracks at Granard and Longford, together affording accommodation for 400 men and 200 horses.

Longford town is incorporated by charter of 25th Nov., 19th Car. II. The governing body consists of the sovereign, bailiffs, and burgesses; there is a seneschal's court with jurisdiction to 200l., but no corporate criminal jurisdiction nor borough gaol. The paving and cleaning of the town are under the control of commissioners acting under the 9th Geo. IV., c. 82. The town is not lighted. Longford is principally built on the southern bank of the Camlin: the county court-house and gaol, and the barracks, are on the opposite side of the river. The town is handsome, and has an appearance of cheerfulness and business. There have been extensive stores erected at the basin which terminates the Grand Canal on the southern side, in which direction several new streets are laid out. The Earl of Longford has recently built a butter-market and shambles. There are branches of the Bank of Ireland, the National Bank, and the Agricultural and Commercial Bank, established here.

Lanesborough has also a charter of the 17th Car. I., but

15

the governing body has not exercised any corporate functions since the Union. Its situation, with a bridge over the Shannon, is favourable to trade, and it has a brisk market for agricultural produce. Great quantities of eggs pass through Lanesborough by the Royal Canal to Dublin and the English markets.

St. Johnstown is incorporated by charter bearing date 3rd April, 3rd Carl. I.; but there are now no traces either of the corporate jurisdiction or of the lands bestowed for its establishment.

Granard, erected into a borough by charter of Charles II. in 1678, is a well-built town, consisting chiefly of one wide street, about half a mile in length. The remains of old Granard, a place of great antiquity, are still traceable a little distance to the west of the present town. A lofty earthen fort, the summit of which is 593 feet above the level of the sea, and about 150 above the surrounding plain, stands at the eastern extremity of the present town, and commands a fine prospect over the extended plains of Meath, Westmeath, and Longford.

Ballymahon and Edgeworthstown are rather large villages than towns. Both are centrally situated, and have brisk markets for grain.

The village of Ardagh, containing 142 inhabitants, gives name to a bishop's see in the province of Armagh. The see, which was founded in the sixth century, was united to the bishopric of Kilmore in 1658; and that union being dissolved, was afterwards, in 1742, annexed to the archiepiscopal see of Tuam, the archbishop holding it as a suffragan of the primate. By the provisions of the Church Temporalities Act, the see, on the demise of the present archbishop of Tuam, is to be reunited to Kilmore.

History and Antiquities.—The territory at present constituting the county of Longford was originally a portion of the kingdom of Meath, and as such was included in the grant of Meath by king Henry II. to Hugh de Lacy, from whom it came through his son Walter to a female heiress, one of Walter's two daughters. Owing to the negligence of her descendants, who lived in England, the territory was lost to the absentee owners. On the erection of the district into a separate county, in the 11th of Elizabeth, it retained few or no traces of ever having been under the authority of the English law or government. The O'Farrels, who almost exclusively inhabited it at this time, consented, on the 11th Feb., 1570, to surrender their interest, and take back their lands on English tenures. On the 12th of April, 1615, a commission was appointed by king James to inquire into his title to the territory. An inquisition was accordingly taken, by which it was found that, under a proviso in the grant of Elizabeth, the crown was entitled by virtue of the act of absentees. On the 5th of August in the same year a commission was issued empowering the Lord Deputy and others to dispose of the estates, so found to be in the king, to patentees. In the distribution which followed the natives had a preference. Upwards of 13,000 acres were assigned to members of the O'Farrel family, and of the entire residue of the county only 17,904 acres were allotted to the new-comers, the remainder being parcelled out among the old inhabitants. The rent reserved to the crown on the new grants was 3*d.* per acre. The plantation did not take effect to any great extent, as in 1641 the entire county appears to have been seized back by the O'Farrels, excepting only Longford Castle and Castle Forbes. The confiscations which ensued extended over nearly the entire county, and introduced almost a totally new proprietory.

The remains of the old town of Granard possess considerable interest when taken in connection with the neighbouring rampart of Duncla, which runs from Loch Kinale to Loch Gownagh, a distance of nearly eight miles. This work is in all respects similar to the Dane's Cast [DOWN], and probably formed part of the division between the antient kingdoms of Meath and Ulster. On the island of Inch-Clorin, in Loch Ree, are the ruins of seven churches, and the foundation of a round-tower. An abbey was founded here, about A.D. 540, by St. Dermid. There are the foundations of another round-tower at Granard. The Lord Richard Tuite, A.D. 1205, built an abbey at Granard in honour of the Virgin, which was afterwards rifled by the Scots, under Edward Bruce, in 1315. In 1541 Richard O'Ferrall, the last abbot, was made bishop of Ardagh. The abbey at Longford was one of Patrick's foundations. O'Ferrall, or O'Farrel, prince of Annaly, founded a very fine monastery on the site of this abbey, A.D. 1400. The church of the friars is now the parish church. Abbeyshrule was another rich foundation of the same family. In Loch Ree, besides the seven churches of Inch-Clorin, were the monasteries of All Saints, founded by St. Kieran in the year 544, and Innisbofin, founded by a nephew of Patrick about the year 530, on islands bearing these names respectively. There are remains of all the preceding, as also of the religious houses of Moydow, Clonebrone, Clone, Derg, and Inismore, a foundation of St. Columba's, on an island in Loch Gownagh. A few castles are still partially standing: the principal ones are at Castle-Forbes, Granard, Tenallick, Castlecor, Rathcline, and Ballymahon.

The county expenses are defrayed by grand-jury presentments. The amount levied in 1835 was 12,606*l.* 9*s.* 2*d.*, of which 4162*l.* 18*s.* 5*d.* was for roads and bridges; 2209*l.* [illegible] 2½*d.* for public buildings, charities, salaries, &c.; 267[illegible] 13*s.* 10*s.* for police; and 3556*l.* 10*s.* 8½*d.* for the repayment of loans advanced by government.

LONGI'NUS, the author of a treatise in Greek 'On the Sublime,' is said to have been born either in Syria or at Athens, but at what time is uncertain. His education was carefully superintended by his uncle Fronto, a celebrated teacher of rhetoric; and he also received instruction from the most eminent teachers of philosophy and rhetoric of his age, especially from Ammonius and Origen. He afterwards settled at Athens, where he taught philosophy, rhetoric, and criticism to a numerous school, and numbered among his disciples the celebrated Porphyry. His school soon became the most distinguished in the Roman empire. After remaining at Athens for a considerable time, he removed to Palmyra at the invitation of Zenobia, in order to superintend the education of her sons. He did not however confine his attention to this duty, but also took an active part in public affairs, and is said to have been one of Zenobia's principal advisers in the war against Aurelian, which proved so unfortunate to himself and his royal mistress. After the capture of Palmyra by Aurelian, A.D. [illegible] Longinus was put to death by order of the emperor.

Longinus wrote many works on philosophical and critical subjects, now known only by their titles, none of which has come down to us, with the exception of his treatise 'On the Sublime,' and a few fragments, preserved by other writers. There is however some doubt whether the treatise 'On the Sublime' (περὶ ὕψους) was in reality written by this Longinus. Modern editors have given the name of the author of this treatise as 'Dionysius Longinus;' but in the best MSS. it is said to be written by Dionysius, *or* Longinus, and in the Florence MS. by an anonymous author. Suidas says that the name of the counsellor of Zenobia was Longinus Cassius. Some critics have conjectured that this treatise was written by Dionysius of Halicarnassus, or by L[illegible] nysius of Pergamus, who is mentioned by Strabo (625, Casaub.) as a distinguished teacher of rhetoric; but the difference of style between this work and the acknowledged works of Dionysius of Halicarnassus renders this conjecture very improbable, and as to the other Dionysius, the conjecture has no foundation. The treatise 'On the Sublime' has for its object the exposition of the nature of the sublime, both as to the expression and the thought, which the author illustrates by examples. As a specimen of critical judgment the work has always maintained a high rank, and in point of style is perspicuous and precise.

The best editions of Longinus are by Pearce (1724), Morus (1769), Toup (1778), and Weiske (1809); the best translations are the German by Schlosser, the French by Boileau, and the English by W. Smith.

LONGIPENNES, Cuvier's family name for the long-winged oceanic birds (*Grands Voiliers*), such as the *Petrels*, *Albatrosses*, &c. The genera which he includes in this family are *Procellaria*, *Puffinus*, *Haladroma*, *Pachyptila*, and *Diomedea*.

LONGIROSTRES, Cuvier's name for a family of wading birds (oiseaux de rivage), in which he includes the genera *Ibis*, *Numenius*, *Scolopax*, *Rhynchæa*, *Limosa*, *Calidris* and *Tringa*, *Arenaria* (*Calidris*, Vig.), *Pelidna*, *Falcinella* (*Erolia*, Vieill.—*Scolopax pygmæa*, Linn.), *Machetes*, *Hemipalama*, *Eurinorhynchus*, *Phalaropus*, *Strepsilas*, *Totanus*, *Lobipes*, and *Himantopus*,—the greater part of which, as he observes, would come under the great Linnæan genus *Scolopax*. He remarks that one can hardly place the *Avocets*, *Recurvirostra*, Linn., in any other position than at the end of the *Longirostres*.

LONGITUDE and LATITUDE. These terms mean different things as applied to a point of the earth, or a star in the heavens; and we must accordingly distinguish between *geographical* latitude and longitude, and *celestial* latitude and longitude.

The latitude of a star in the heavens is its angular distance from the ecliptic, measured on a great circle drawn through the star and pole of the ecliptic. It differs from the DECLINATION only in this, that the ecliptic is used instead of the equator. The longitude of a star is the angle made by the circle on which latitude is measured with the circle which passes through the pole of the ecliptic and the vernal intersection of the equator and ecliptic. Thus a star on the ecliptic has no latitude, and one which lies directly between a pole of the ecliptic and the vernal equinox has no longitude. The use of celestial longitudes and latitudes has in great measure been superseded by those of right ascensions and declinations.

The meaning of the term geographical longitude is the same whether we consider the earth as a sphere or a spheroid. It is the angle contained between the plane of the meridian of the place, and that of some one meridian which is fixed on as the starting-place. Thus we choose the Observatory of Greenwich, and the French that of Paris, as being in the first meridian; and while we express the relative position of the two observatories (in longitude) by saying that Paris is 2° 20′ 24″ east of Greenwich, the French describe Greenwich as 2° 20′ 24″ west of Paris.

It is usual to measure terrestrial longitudes in time (ANGLE; TIME), the whole circuit of the globe being supposed described (as in the diurnal motion) in 24 hours. It is also usual to reckon longitudes to 180° east or west, without proceeding farther. Thus a motion in longitude of 185° east will bring the traveller into 175° of west longitude. In astronomical writings, however, longitudes (both geographical and celestial) are measured all round the globe.

Supposing the earth to be a sphere, the latitude of a place is the angle subtended at the centre by the arc of the MERIDIAN intercepted between the place and the equator. This angle is equal to the altitude of the pole of the heavens at the place, and the determination of the altitude of the pole is the method usually resorted to for determining the latitude. But the earth not being precisely a sphere, but a spheroid (GEODESY), the zenith line (which is a perpendicular to the tangent plane) does not pass exactly through the centre, and the altitude of the pole is not precisely the angle subtended at the centre by the arc of the meridian. It is however the altitude of the pole which is called the latitude of the place; and it must be distinctly understood that a latitude, astronomically determined, is the angle made by a line which is vertical at the place with its projection on the equator. The angle subtended at the centre of the earth by the arc of the meridian is less than the altitude of the pole by a number of seconds equal to

$$\frac{\epsilon}{\sin 1''} \times \text{sin. twice the latitude,}$$

where ϵ is the ELLIPTICITY. Assuming this at $\frac{1}{300}$, the above is such a proportion of 11′·5 as the sine of twice the latitude is of unity.

The reason why the preceding is not of more importance in the construction of maps lies in this, that when a large portion of the earth is mapped, the scale is necessarily too small to make such an error of any consequence; and when a small portion of the earth is taken, the error is nearly the same in every part of the map, and relative positions are not sensibly affected.

The method of finding longitudes and latitudes is given in the next article. The history of this problem, or rather of that of finding the longitude in particular, divides itself into two portions. The first, or the account of the real progress of the problem, is so mixed up with the history of astronomy and horology, that it would be useless to attempt it within any limits which we could afford: the second is that of the speculators who have misunderstood the problem, and is not worth the recital. Since however there are still persons who imagine that some mysterious *method* is yet attainable, by which the longitude is to be found, and since the conductors of the newspaper press are not all sufficiently aware of the state of the problem to prevent the insertion from time to time of paragraphs which create a most erroneous impression, we shall briefly point out the source of the fallacy which has misled so many persons.

The determination of the longitude requires simply accurate instruments for the measurement of the positions of the heavenly bodies, and one or other of the two following—either perfectly correct watches, or perfectly accurate tables of the lunar motions. The legislature of Queen Anne, which passed an act offering a reward for the discovery of the longitude, the problem being then very inaccurately solved, for want of one or the other, good watches or lunar tables, never contemplated the invention of a *method* but only of the means of making existing methods sufficiently accurate. And the legislature of George III., which repealed the former act and substituted another, specifically limited the reward to those who should either proceed by improvement of chronometers, or of lunar tables. The rewards which were given were to Harrison for the former, and to Mayer's executors for the latter. The latter act is now repealed, and there does not exist any parliamentary offer of a sum of money for further improvements.

Many persons, imagining that, as in the case of the quadrature of the circle, &c., a theoretical difficulty existed, have employed themselves in endeavouring to invent a method, imagining that they should obtain the prize held out by the legislature. Some persons still occupy themselves in this manner; and it is impossible to persuade them either of the repeal of the acts of parliament, or of their having mistaken the nature of the difficulty, which is now, for all practical purposes, entirely conquered. It is impossible to find the latitude of a place without knowing the position of the equator in the heavens, or the longitude without knowing the meridian of Greenwich. The equator has a real existence in the heavens, since its pole is the immoveable point of the heavens, which can be detected (though it is not absolutely occupied by a star) from observation of the motion of the stars, which always preserve their distance from the pole. But the meridian of Greenwich, a purely arbitrary circle of the earth, determined merely by the will of Charles II. that an observatory should be built on a certain hill near London, has no representative in the heavens. The only method then of finding longitude from the heavenly bodies is by finding the hour of the day which it is at Greenwich, at a particular hour on the spot whose longitude is required. It is then known how much of 360 degrees is revolved through by the earth in the period which brings a star from the meridian of the place upon the meridian of Greenwich, or *vice versâ*; and this angle is the longitude. A watch which goes correctly and is set at Greenwich will carry the time at that place all over the world; or a celestial phenomenon, of which the Greenwich time may be predicted, will, if the moment of its happening be observed at any other place, give the difference of times at the moment of observation. Any proposal for finding the longitude *astronomically*, which does not depend on one or the other of these principles, is useless, unless it be that of actually measuring the distance between the given place and Greenwich, the latitudes of both being known. Whether it be *possible* to use any other than astronomical means for the purpose, it would be presumptuous to decide; but there certainly is no other method which offers the most distant prospect of success.

LONGITUDE AND LATITUDE, METHODS OF FINDING. We shall classify the various modes of determining geographical latitude and longitude partly by the instrumental means of the observer and partly by the nature of the phenomena. The problems are of course the same whatever instrument is employed, for the latitude of a place is the altitude of the pole of the heavens at that place, and the longitude is the difference between the time on the first meridian (we shall always suppose Greenwich to be the first meridian) and the time at the place, at the same physical instant.

Determination of the Latitude at Fixed Observatories and Independently.—1. In determining the latitude at fixed observatories which are furnished with accurate circles, mural, transit, or altitude and azimuth circles [Circle], the altitudes or zenith distances of circumpolar stars are observed above and below the pole. When these are properly reduced, the place of the pole (which lies between the places of upper and lower culmination of each star) is known, and hence the latitude is found. The first object of all astronomers is to fix the latitude of their place of observation, and the details of this operation will be found in the beginning of most of the published series of observations. The account of the latitude of Greenwich in the Greenwich Observations for 1836, p. lviii., of Cambridge in the Observations of 1833-4-5, and of Edinburgh, 1834-5, may be consulted by those who wish to know what the process is, with the most perfect means which we at present possess.

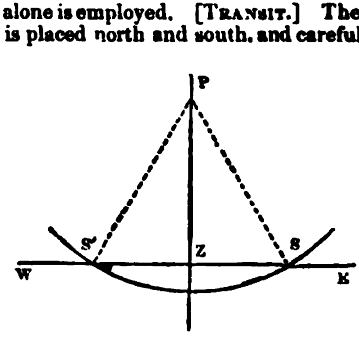
2. Again, if the altitudes or zenith distances of the sun be observed several days before and after the summer and winter solstices, the altitude or zenith distance of the middle point, *i.e.* of the equator, may be deduced. Since the tables of refraction have been perfected by Bessel, these observations give a satisfactory latitude. Both methods may be considered to be independent, as they do not draw their data from other observatories, and no great accuracy is required in the solar tables to reduce the observations of the sun to the solstice. (Pond's *Lat.*, *Greenwich Observations*, part v.)

In the observatories of Europe, and generally where the visible pole of the heavens is tolerably high, the latitude is best determined by circumpolar stars; near the equator an independent latitude must be deduced from circumsolstitial observations.

3. Before the introduction of circles, the latitude in fixed observatories was derived from combining two instruments, the mural QUADRANT and the ZENITH SECTOR. The zenith distances of stars near the zenith, and to the north or south of it, were observed by the zenith sector, and also the distances of the same stars from the pole or the equator by the quadrants; hence the arc between the pole and zenith (the co-latitude), or between the zenith and equator (the latitude), was deduced. The place of the pole was found on the north quadrant from circumpolar stars, and the place of the equator on the south quadrant, from observations of the sun near the solstices, as we have described above. When the present zenith tube was erected at Greenwich, one of its intended uses was to perform the same office for the mural circle as the original zenith sector did for the quadrants.

Determination of the Latitude Differentially.—1. The ZENITH SECTOR, when of the proper size and construction, is perhaps the most accurate instrument for determining latitudes *differentially*, i.e., assuming data which are either known or can be obtained from fixed observatories. With this instrument, the meridian zenith distances of several stars which pass near the zenith may be observed with great certainty; and as the polar distances of those stars are or may be determined at first-rate observatories, the polar distance of the zenith, or the co-latitude, is known. The latitudes for the trigonometrical survey of Great Britain are thus deduced by comparison with Greenwich, the instrument employed being a very fine 8-feet zenith sector by Ramsden. With a better knowledge of the proper motion of the stars, the sector might be used at two places, and the arc between those places obtained from observations of the same stars at two epochs, without reference to any other observations; but at present it is safer, when practicable, to refer directly to corresponding observations made at a fixed observatory.

2. Another differential method has lately been much used (at least by continental astronomers), in which the transit instrument alone is employed. [Transit.] The axis of the instrument is placed north and south, and carefully levelled, in which case its line of sight will describe the prime vertical. In the figure, let P be the place of the pole, Z the zenith, EZW the prime vertical, which is also the line described by the middle wire of the telescope when it revolves. Let a star, of which the polar distance is well known, be observed at S and S′, and the times noted. Then PS, the polar distance of the star, is known, and the angle SPS′ is equal to the time between the observations, and consequently ½ SPS′, or SPZ, is known; hence we have SP and SPZ in the right angled spherical triangle SPZ, and tan PZ = tan PS × cos ∠ SPZ, from which PZ, or the co-latitude, is obtained. This is perhaps the most accurate mode of determining the latitude with moderate instrumental means. The transit should be reversed on alternate nights, so as to get rid of the effect of imperfect collimation or unequal pivots, and the level applied repeatedly before and after the observations. The method depends mainly upon the delicacy of the level and the perfect truth of form in the pivots, and when all precautions are taken the results are surprisingly good. The supports of the instrument must also be perfectly steady during the levelling and the observation. Differences of latitude may be determined by the transit instrument independently, by observing the same stars at the two stations. In this case any error in the assumed polar distance of the stars will not affect the accuracy of the result.



3. If an observer can carry with him a circle, either an altitude and azimuth, or a repeating circle, he may determine the latitude by circumpolar stars independently; but it is better to observe the zenith distances of well known stars several minutes before and after they pass the meridian.* [Circle; Repeating Circle.] The reduction to the meridian is easily computed [Repeating Circle], and the places of the stars inserted in the 'Nautical Almanac' are sufficiently accurate. It is advisable to observe stars at different zenith distances from 70° on each side, to near the zenith, because if there be any fault in the instrument which depends on the zenith distance, the stars will be affected similarly on both sides of the zenith, *i.e.* the zenith distances to the north and south will both be too large or too small. Now as the co-latitude is equal to the zenith distance ± the polar distance when the star is north of the zenith (+ when observed above the pole and − when observed below) and is equal to the polar distance − zenith distance when the star is south of the zenith, it is clear that an error in the zenith distance will have precisely opposite effects on the co-latitude deduced from a north and from a south star. Besides, the coincidence or discrepancy of the observations will afford a tolerable notion of the instrument and the observer, and of the value of the final result. The repeating circle was at one time over estimated, and perhaps at present is not quite rated at its true worth, a careful and intelligent observer will come very near the truth with it, or with the altitude and azimuth circle. Both are rather troublesome to use, and both require either a very solid support, or a second observer to read the level while the first observer bisects the star and

---

* The number of minutes which it will be prudent to observe depends on several circumstances. If the time is known to one second, which it ought to be, the observations may be commenced when an error of 1ˢ in the time will affect the latitude 1″. In ordinary cases, and for observers who do not understand the reason of the thing, 10ᵐ on each side of the meridian is a sufficient direction.

varies the time. Neither can they be considered as portable in ordinary circumstances, when large enough for convenient use. The azimuth circle should scarcely be less than twelve inches in diameter in either construction. On the whole we are inclined to prefer the repeating circle as a travelling instrument, and the altitude and azimuth for a permanent situation; but it must be confessed that few observers have the patience or skill to get the greatest possible accuracy out of either. The observations should be confined to stars, as neither of these instruments will keep its adjustments well under the sun.

The repeating circle was used by the French astronomers to determine the latitudes in their great survey. Since that time the instrument has been much better made, and the catalogues of stars which have issued from Königsberg, Greenwich, and Cambridge have supplied more accurate and convenient means of using it. If the levels are very good and sensible, we think that the observations of one fine night, everything being favourable, should bring out the latitude within 2″ or 3″.

4. The last class of instruments to be noticed is that of reflecting instruments, including the reflecting circle of Troughton, the repeating reflecting circle of Borda, and the sextant of Hadley. These will be described under the article SEXTANT, as the title best suited to their essential quality of reflexion. At present we must suppose a general knowledge of their nature. And first we will suppose the observer to have a stand and a mercurial or other horizon. In this case, standard stars should be observed several minutes before and after the meridian passage to the north and south, between the altitudes of 15° and 60°, and as much as possible in pairs, that is, for each star to the north, a star to the south should be observed about the same altitude, or two, one higher and the other lower, so that the mean altitude should nearly correspond. Whatever errors may exist in the division, glasses, &c., will be the same in each star of the pair, and as the error will affect the latitude differently, the mean latitude will be free from the error very nearly. In this way several pairs may be observed, taking the stars of the 'Nautical Almanac,' and the mean of the whole will come out very near the truth. With a good sextant or circle, and a mercurial horizon, we believe that a careful observer would get the latitude within 5″, in one fine night. It is however supposed that everything is favourable, and especially that the instrument is supported on a stand. This is absolutely necessary for the accurate observation of stars, which dance very perplexingly when the instrument is held in the hand and a high power applied. If a stand cannot be afforded, the sun is far the best object to observe with a reflecting instrument. It is always supposed that the observations are made for several minutes before and after the meridian passage, and the time noted for computing the reduction to the meridian. The meridian altitude of the sun, such as it would be if observed on the meridian and freed from instrumental and other errors, is then computed, and as the longitude of the place is known, at least approximately, the declination of the sun at its passage over that meridian may be computed from the 'Nautical Almanac.' The meridian altitude + the south declination of the sun, or − the north declination, is, in the northern hemisphere, the co-latitude of the place. With Troughton's circle, the limbs are alternately observed, to get rid of the sun's diameter, and the number of observations, forwards and backwards, should be equal, so as to get rid of the index error. With the repeating reflecting circle, the observations should also be of the upper and lower limbs alternately, and should be carried quite round the circle, so as to get rid of eccentricity. In the sextant the index error should be carefully determined before and after each day's observations, and the alternate limbs observed exactly as with the circles. There is however no way of getting rid of eccentricity in the sextant by observing one object, and any fault in determining the index error will vitiate the latitude to half its amount. Where the circles will probably give a latitude to nearly 5″, with a very careful series of observations of the sun, the sextant used with equal care might be out 10″ or 15″. It is evident therefore, that where accuracy is an object, the observer ought, if possible, either to use a circle or to mount the sextant upon a stand, and observe stars as we have above described. It is an additional reason to carry a stand, when practicable, that in low latitudes the sun cannot be observed at all for the latitude, nor any object which is elevated 65° or 70°. In this case stars must be used; and without a stand, the observation, using high magnifying power, is difficult and unsatisfactory. In speaking of the horizon we always mean a mercurial horizon, except another is specified. The glasses of the roof should be truly plane and parallel, but by reversing the horizon for half the observations any error of this kind is destroyed. The mercurial horizon is unfortunately heavy and inconvenient, and troublesome from its tremors wherever there is any motion. Several substitutes have been used. Oil or treacle has been adopted with good success where the shaking from carriages, &c. has prevented the use of mercury. Sometimes a piece of glass is set horizontal by a level applied to its surface, or by a fluid below it, so as to get a reflecting surface, but these generally absorb too much light to be used conveniently for stars, and are not very trustworthy. The best substitute seems to be a piece of speculum metal, ground plane, and laid horizontal by a level. It is certainly the brightest, and therefore the best for stars, but it must be remembered that horizons which are not self-regulated, by being fluid, are scarcely to be trusted under a hot sun. Troughton's reflecting circle is rather heavy, and reading three verniers for every observation is troublesome, especially at night, but it is very accurate, and fewer observations are required. Borda's reflecting circle may be made much smaller and lighter, but demands the most exquisite workmanship, a greater number of observations, and more reduction. The simple sextant is more manageable, but requires greater precautions and checks in its use. But with any of these a skilful observer will get the latitude very nearly. Sextants are made of all sizes from 10 inches radius (which is probably not so good as 8 inches) down to the snuff-box sextant of 1½ inches radius. For travellers who cannot afford to carry much weight, the 3-inch sextant is very convenient. In a recent communication to the *Royal Astronomical Society*, Mr. Lowell states, that with a 3-inch sextant made by Dollond, which packs up, stand, horizon, and all, in a box 4·5 inches square and 2·7 deep, he found that he could get the latitude within 10″, and the time to 1·0 by observations of stars. The horizon was of speculum metal, ground by himself, and set true by a level. The observations sent with the account completely justify Mr. Lowell's opinion, but one observer differs more from another in sextant observations than in any other class of astronomical instruments; with the snuff-box sextant, altitudes may be got within 1′. The state of the barometer and thermometer must be noted at the time of all observations for the latitude, in order to compute the true refraction. At the same time we may remark, that if the observations be *balanced, i.e.* if the altitudes to the north have nearly corresponding altitudes to the south, the refraction will affect the observations like an instrumental error, and the variations depending on the barometer and thermometer will be quite insensible.

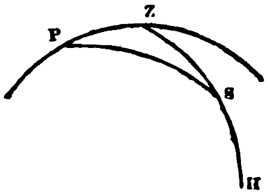
5. Observations of Polaris may be taken at any time for the latitude, and there are tables for *approximate* reduction given in the 'Nautical Almanac' for each year.

6. At sea the sextant is the only instrument which can be used, and the latitude is generally got by observing the altitude of the sun's lower limb when on the meridian, above the sea horizon. This is rather a rude process, but the resulting latitudes are generally true to 1′, or at worst to 2′. The moon, since 1834, the date of the improved and extended 'Nautical Almanac,' may be very conveniently used for finding the latitude at sea, and the brighter planets and stars are often observable on the meridian. The latitude may also be deduced from two altitudes of the sun, and the time elapsed between the observations, or indeed from any two altitudes of two known celestial bodies, one of which is near the meridian, and the other distant from it, as persons not acquainted with spherical trigonometry may satisfy themselves on the celestial globe. There is a considerable difficulty in seeing the sea horizon by night, which is somewhat reduced by getting as near the level of it as you can.

Determination of the Longitude.—The determination of the longitude of any place on the earth's surface, astronomically considered, resolves itself into two parts, the finding the time at the place of observation, and finding the time, at *the same moment*, on the first meridian (we shall always speak of Greenwich), or at any place the longitude of which from Greenwich is well known. It will be more convenient to classify the methods of finding the longitude by the phenomena than by the instruments.

Determination of Time at the Place.—1. This is best and most easily done by a transit instrument, and the time, when found, is kept by a clock or chronometer. [TRANSIT.] The transit however is neither a very portable instrument, nor is a proper situation for it, we mean one sufficiently steady, readily found.

2. The time can also be found from the altitude of the sun, planets, or stars out of the meridian. Thus let P be the pole,



Z the zenith, and Z S the zenith distance, or S H the altitude of any heavenly body, the right ascension and declination of which are well known, and consequently the polar distance P S. From these data and P Z the co-latitude of the place, the angle Z P S can be computed, called the hour angle, and this, if the body be the sun, and to the west of the meridian, is the *apparent* time after noon; or if the sun be to the east, the hour angle is the *apparent* time before noon. This apparent time is easily reduced to *mean* time with the data of the 'Nautical Almanac.' When the object observed is a planet or star, the hour angle being added to the right ascension when the body is to the west, or subtracted from the right ascension when the body is east, will give the sidereal time, which can be reduced to mean solar time with only an approximate knowledge of the longitude. The problem therefore of finding the time consists generally in observing the altitude or zenith distance of any known object, and determining the hour angle from it. The repeating or altitude and azimuth circles are very fit for this purpose, but the most usual and portable instrument is a reflecting circle or sextant with its horizon and a chronometer. The observations of altitude should be made as much as possible on the prime vertical, *i.e.* when the object is east or west. Again, to get rid of instrumental error, and also to save computation, the sun should be observed, when convenient and possible, at the same altitude morning and evening. We should also recommend when the sun is observed that both limbs should be observed without moving the index. For instance, if in the morning the sun were about 14° high, set the instrument to 30°, note the instant when the upper limb by reflection touches the upper limb seen in the horizon, read off the angle very carefully, wait till the lower limbs form their contact, and note the time. Then set to 31° 30′ or 32° and proceed as before, and repeat the operation, having again set forward 1° 30′ or 2°. The observer has then several checks without trouble, for the times in which the sun rises through a diameter will be sensibly equal or vary uniformly; and in like manner the times of rising through 1° 30′ or 2° will point out if any of the usual errors have been committed. In the afternoon the same process should be repeated in an inverse order, and the time of apparent noon deduced from each pair.[*] It is to be understood as a universal rule, that the index error is to be carefully determined, and the barometer and thermometer noted whenever observations of altitude for time or latitude are made.

3. The same mode of observing equal altitudes might be applied to stars, but the observations would be extended to very inconvenient hours, and it is *nearly* as accurate to observe two bright stars, one to the east and the other to the west, and if possible at about the same altitudes. Each star will then give an error of the chronometer, and if the altitudes are rightly observed, the *same* error of the chronometer. If the errors do not agree, a mean will come nearer to the truth than either of them separately; but if the stars have not the same polar distance, the effect of a given error in altitude upon the hour angle must be computed for each, and the difference between the chronometer's errors divided in this ratio. Thus, suppose the eastern star gives a chronometer error of 25ˢ.0 fast, and the western star an error of 28ˢ.0 fast, while an error of 1′ in the altitude of the eastern star causes twice the error in the deduced hour angle that a similar error of 1′ does in the western star; the concluded true error should be 27ˢ.0, instead of the mean error 26ˢ.5. The reader will see that if the observations are made at exactly the same altitude, any mistake as to the index error, refraction, or any instrumental defect, is thus got rid of without much trouble. But, as has been mentioned before, very perfect observations of stars with reflecting instruments can scarcely be made unless the instrument is mounted on a stand. From good sets of observations of a star east and a star west, the time may be determined to 0ˢ.3 or 0ˢ.4. The time is required to reduce circum-meridian observations to the meridian for finding the latitude, and again the latitude is required in order to deduce the time from altitudes. An approximate latitude, such as results from the largest observed altitude about the meridian, will give the time near enough for the reduction to the meridian, and then the time may be computed rigorously with the exact latitude. Provision may be made for this revision by taking out the differences of the logarithms at each step of the first computation; but generally speaking, when the altitudes for time are taken near the prime vertical, as they ought to be, a small error in the latitude has so little effect on the hour angle, that the approximate latitude is near enough.

Determination of Greenwich Time astromically.—1. There are two phenomena which are seen at the same moment from whatever part of the earth they are visible, viz. a lunar eclipse and the eclipses of Jupiter's satellites. The first was the only phenomenon from which longitudes were derived previous to the invention of telescopes, but it is not of frequent occurrence, and unfortunately cannot be noted very exactly. It has been proposed to measure equal quantities of the eclipse on each side of the middle, and formerly astronomers were very careful to note the moments when the umbra touched or covered well-defined spots. But at present, lunar eclipses are scarcely regarded, as there are many more accurate means of determining the longitude, and of more frequent occurrence; and lunar eclipses are of no value in the theory of the moon's motions. The eclipses of the satellites of Jupiter, especially of the first satellite, are much more common, and have been of great use in modern geography. The time at which the eclipses take place, i.e. when the satellite, passing into the shadow of Jupiter, is lost (immerges), or passing out of the shadow, becomes visible (emerges), are set down in the 'Nautical Almanac' at the time they would be seen at Greenwich if visible. The observer at any other place notes when this phenomenon does actually happen at the place of observation, and the difference between the two times is the longitude of the place from Greenwich; east if the time of the eclipse is later than at Greenwich, and west if it be earlier. Unfortunately this method, so easy in practice, is by no means as accurate as it might at first sight appear. The theory of the satellites is scarcely to be considered as perfect, but this objection might be obviated by comparing corresponding observations, and might be very much diminished by correcting the predictions of the 'Nautical Almanac' by observations made at Greenwich, or any other well known place, about the same time. But the phenomenon is a gradual and not an instantaneous one, and the appearance or disappearance of the satellite varies greatly with the goodness of the telescope, the eye or mood of the observer, the atmosphere at the place of observation, &c., so that a longitude deduced from an eclipse of the first satellite may be considerably wide of the truth. With ordinary telescopes we believe that eclipses of the second satellite are more than twice as uncertain as the first, and that the third and fourth satellites are not worth observing for this purpose, being much inferior to good lunar distances. A large mass of eclipses of Jupiter's satellites made by the same telescope and the same observer, and where the immersions are nearly as numerous as the emersions, will however yield a satisfactory result. The aperture of the object-glass employed, and also the sight of the observer, should correspond as nearly as possible with the telescope and observer at Greenwich, or whatever place is adopted as a standard of comparison. It is not considered advisable to use a smaller telescope than an achromatic of 2¾ inches aperture for this purpose, or one larger than of 3½ aperture.

2. The time at Greenwich is most accurately determined by solar eclipses or occultations of fixed stars by the moon.

---

[*] There are tables for this purpose in Schumacher's 'Hülfstafeln,' and in many sets of tables.

The computations are rather long, but not very difficult or abstruse. The beginning and end of the solar eclipse should be observed; the latter is the better marked phenomenon, and if the eclipse be annular, the commencement and breaking up of the annulus. Recent observations have shown that these appearances are not instantaneous, and therefore that longitudes deduced from them are not free from uncertainty. The occultation of a fixed star by the moon is not liable to this objection; and when the star is bright, and both immersion and emersion can be carefully observed, the longitude from an occultation affords perhaps the best determination possible of the longitude between two distant places. Yet even here doubts may arise, at least in some cases. The star may be occulted too early by a lunar mountain, or disappear too late in a lunar valley. The occultation should be observed at both places, which is not often possible, and the star should pass not far from the centre of the moon. If the solar eclipse or the occultation be not observed at Greenwich, or at any well determined observatory, the data of the 'Nautical Almanac' must be corrected by the meridian observations of the moon about the time. The tables of the sun are at present nearly as perfect as observation can make them, but the moon may be out 15″, or even 20″, which might occasion an error of 30ˢ or 40ˢ in the deduced longitude, or from an eighth to a sixth of 1°. The solar eclipses, &c., with a map showing in what parts of the globe they are visible, are given in the 'Nautical Almanac,' and the occultations by the moon of all fixed stars to the sixth magnitude inclusive, visible at Greenwich, are also predicted to the nearest minute, with such a description of the relative situation of moon and star as will enable any one to observe them without difficulty. All possible occultations of fixed stars to the fifth magnitude inclusive, visible anywhere, are also set down in that valuable work, with the data necessary for determining whether they are visible at any specified place. We cannot press too earnestly on all persons interested in perfecting geography, the absolute necessity of learning to *observe* an occultation, and to take altitudes methodically with a circle or sextant. The computations may be made at home. It is mortifying to see how very little has been done by English travellers for the exact determination of places on the earth's surface, and to know at the same time how little talent and how small an apparatus are required for making excellent observations. As a nation we have shown abundant zeal and courage, but there has been a lack of elementary knowledge in the directors of our geographical researches, and in the observers selected, which ought to be remedied.

The transits of Mercury over the sun are rare, and the longitudes derivable from them not very accurate.

3. A good and now fashionable method of determining the longitude is by observing with a transit instrument the meridian passage of the moon's bright limb, and of stars which are near her parallel of declination. The 'Nautical Almanac' contains a list of the stars proper to be observed with the moon, and also the variations of the moon's R. A. in one hour of longitude, for computing the longitude.[*] When the place of observation is tolerably near Greenwich, the computation is very simple, *i.e. if the transit is nearly in the meridian and the moon is observed over all the wires.* The error of the chronometer is taken from the neighbouring stars, and the transit of the moon corrected for this error, and for the rate, if sensible. If the place be to the east of Greenwich, the R. A. of the moon is less; if to the west, the R. A. is greater than at Greenwich. Taking the difference between the R. A. at the place and at Greenwich, and dividing by the variation in one hour of longitude, you have the longitude of the place E. or W. in hours and decimals of an hour. But this result requires correction when the corresponding observations at Greenwich, Cambridge, Edinburgh, &c., can be procured; for the R. A. of the moon may be erroneous more than 1ˢ.0 from the imperfection of the lunar tables, and the stars may not be perfectly well determined, though that fault is daily disappearing. By using the R. A. of the moon and stars *observed* at Greenwich, the longitude will not be affected by the errors of the tables. It is pretty much the same thing, and at times more convenient, to let the former computation stand, and to compute the longitude of Greenwich, Cambridge, &c., from the observations respectively made there, taking care to note the signs of the resulting longitudes. Then if the longitudes of the known and of the unknown place are both east or both west, the difference will be the true longitude of the unknown place, east or west of the known one. Some telescopes give a larger image of the moon than others, and its apparent diameter is affected by varying the aperture of the object-glass. The resulting errors in the longitude are got rid of by observing the second limb as often, if possible, as the first, and then, keeping the results separate, by taking a mean of the two. There is a mistaken notion among many observers, that there is no need to care for the position of the transit. Now any considerable error in the position of the transit does occasion an equivalent error in the longitude, and though it can be corrected, if there are data for determining the want of adjustment, this gives some trouble in the computation. It is so easy to place a transit very nearly in the meridian, and to adjust it in every respect, at least approximately, that there is no excuse for carelessness in this respect. The observer should always take the transits of a star near the pole, and of all Greenwich stars above and below the moon which pass about the time of her culmination, and it is proper to reverse the instrument on alternate nights. When the place of observation is very distant from Greenwich, it will be necessary, until the quantities *a, b, c, d*, mentioned in the note, be computed, to take a little more trouble. The approximate longitude is calculated as before, and then the R. A. of the moon's bright limb must be computed for the corresponding Greenwich time, from the R. A. of the moon for every hour; the moon's semidiameter in R. A. must also be computed. We have found it on the whole most intelligible, and therefore most safe, to compute the R. A. of the moon's bright limb on two hypotheses of longitude, one the minute above and the other the minute below the approximate value. These results are to be corrected by the Greenwich or other observations for the error of the lunar tables, and then, by simple proportion, the correction is determined for one of the hypothetical longitudes. This is rather a long process, but it is strictly accurate, and the steps are intelligible as the computer proceeds. The method of determining the longitude by transits of the moon and stars is the best for places very distant in latitude or longitude, where the same occultations cannot be seen. It is nearly as good for the most distant as the nearest place, the variation of the error of the lunar tables being the only additional cause of inaccuracy, and the phenomenon presents itself very often. It does however require a very nice and well fixed instrument and a careful observer, as 1ˢ error in observing the R. A. of the moon will cause an error of nearly 30ˢ in the resulting longitude, or ⅛ of a degree. A considerable mass of observations of both limbs corrected by corresponding observations will scarcely be more than 2ˢ or 3ˢ wrong.

4. But where a transit instrument cannot be carried, or cannot be used, as at sea, the longitude must be found *astronomically* by the distance of the moon from the sun, planets, or fixed stars, measured with a reflecting instrument. This apparent distance is reduced to the true distance, *i.e.* such as it would be, seen from the centre of the earth, and as these distances are computed and set down in the 'Nautical Almanac' for every three hours Greenwich time, as they would be seen from the same place, the Greenwich time corresponding to the time of the observation can be calculated. But the time at the place is always supposed to be known from observation, and hence the difference gives the longitude. The longitude may be determined on shore by lunar observations, and, if a stand be used, with much greater accuracy than at sea. All ships and travellers ought to be well supplied with chronometers, *i.e.* the means of keeping their Greenwich time when by observation they have got it, and then the result of the observation and computation is simply stated to be the error of the chronometer on Greenwich time. The chronometer, if the rate be pretty well known, continues to give the Greenwich time (the correction for error and rate being applied) for several days; and the longitude is found every day, by comparing the

---

[*] These data might perhaps be further extended with advantage. Suppose the R. A. of the moon's bright limb on the meridian of Greenwich to be m; on the meridian of any other place the longitude of which is required, m'; the longitude of the place to be l, + when West, and — East; then m' can be thus expressed: $m' = m + a\,l + b\,l^2 + c\,l^3 + d\,l^4$, where a, b, c, and d can be previously omputed, l being in decimals of a day. The approximate value of l, from the rst term, $= \frac{m'-m}{a}$. Substituting this value for l, let the sum of the other erms $= s$, then the exact longitude $= \frac{m'-m}{a} - \frac{s}{a}$.

actual time at the place of observation with the Greenwich time at the same moment, given by the chronometer. We have spoken as if one chronometer alone were used, but it is mere folly to rely upon one or even two chronometers in a ship, or in important geographical researches.* These are to be compared from day to day, to ascertain that they are not suddenly altering their rates, and also whenever any astronomical observation is made which determines the Greenwich time (for that gives the error of each of the chronometers), or the time at the place. In reducing observed lunar distances to the true lunar distances, the altitudes of the sun and moon, or moon and stars at the time of observation are required, and at sea two observers are commonly set to measure these altitudes at the moment the lunar observer gives a signal that he has made the contact; indeed a fourth person is sometimes engaged in noting the chronometer. On shore this profusion of aids cannot always be obtained, nor are they at all wanted. If the time at the place and the latitude be known, the altitudes may be computed, or the observer may proceed thus: 1st, an altitude of the sun, planet, or star; 2ndly, an altitude of the moon's bright limb; 3rdly, three lunar distances; 4thly, a second altitude of the moon; and 5thly, a second altitude of the star or sun, noting the chronometer at each observation. He will then have the means, by simple proportion, of reducing the altitudes to what they would have been at the time of observing the lunar distances.

We should advise observers, who are properly furnished with chronometers, rather to make a large number of observations on a few favourable nights, than to take a few observations on many nights. By observing several lunar distances on both sides of the moon, and from all the stars and planets east and west given in the 'Nautical Almanac,' the errors of the instrument may be in a great measure eliminated, and the error of observation much diminished. It is evident that if two equal distances are taken, one east of the moon and the other west, then any error of the instrument, such as erroneous index error, want of parallelism in the glasses or telescope, excentricity, &c., would be the same in each, and therefore could be got rid of. In like manner, if two observations on the same side of the moon give different longitudes, it is clear that the instrument has some error which is *not* index error. On this subject we shall have occasion to speak again in treating of the sextant. The luni-solar observations are generally preferred by seamen (and they are perhaps the most satisfactory), partly perhaps because the altitude of the sun, by giving time at the place, is immediately applicable to the determination of the longitude. The longitude from lunar distances, however carefully taken, cannot be relied upon to very great nicety. With all appliances, a distance to $10''$, and a longitude to 20^s, or 1-12th of a degree, can scarcely be considered as certain, and the errors of the lunar tables will not unfrequently double this error. At sea it would not be safe to rely on any series of lunar distances for a less quantity than 1^m of longitude, or 1-4th of a degree, but this is quite sufficient for the purposes of navigation in open seas.

The computation of lunar distances is very easily performed by Thomson's tables, which are exceedingly convenient, and require only a little more extension. They are approximate, but near enough for the navigator and the traveller *en route*. As the last accuracy can only be given to the computations after the errors of the lunar tables are corrected, there is no need of much refinement in the previous work.

It has been proposed to determine the longitude on shore by taking altitudes of the moon with the mercurial horizon; and between and near the tropics the method may be a good one. In these low latitudes the motion of the moon in altitude is nearly vertical and very rapid, and this motion is doubled by observing the distance between the moon and its image seen by reflexion. The bright edge of the moon is a good object in reflecting instruments. The calculation may be made thus:—The time at the place must be most scrupulously determined, and the error and rate of the chronometer known, if possible, by equal altitudes of the sun on each side of noon and midnight. Then the error of the chronometer being known at the place and time of observation, assume an approximate value of the longitude, and determine the Greenwich time, the R. A. and declination of the moon, and its apparent diameter and parallax. Each altitude of the moon will, when properly reduced, give an error of the chronometer, which, if the assumed longitude be correct, will agree with the error obtained by the sun or stars. If there be a difference, a second longitude may be assumed, and thus, as has been shown in speaking of transits of the moon, the terms obtained from which, by a simple proportion, the true longitude can be deduced. It is not improbable that the doubling the motion of the moon in observing by reflexion, and the sharpness of the images, may make up for the error committed in ascertaining and keeping the time, but of this the observer must be the judge.

Determination of Greenwich Time by Chronometers.—Hitherto the Greenwich time has been extracted from astronomical phenomena, but where the distance is not great, the time may be brought from Greenwich by chronometers. Suppose, for instance, the longitude of Madeira were required: then having ascertained the errors and rates of several good chronometers at Greenwich, they are carried to Madeira, and their errors on the meridian of Madeira, and their rates, determined there. The Greenwich time is known from each chronometer, supposing the rate during the voyage to be the mean of the rates before and after, and thus each chronometer gives a longitude of Madeira, and the mean of the whole is taken. The voyage back to Greenwich, in like manner, with the errors and rates on arriving at Greenwich, furnish a second longitude; and if the motion at sea has any tendency to alter the rates, this cause will affect the first determination with a certain error, while it affects the second determination with exactly the same error, but in a different sense. If it increases the difference of longitude one way, it diminishes it the other way. By a mean of several such voyages the difference of longitude of places within a week or perhaps a fortnight's journey may be ascertained with considerable exactness. The best determination of this kind which has come to our knowledge is the difference of longitude between Berlin and Altona. (*Berliner Jahrbuch*, 1839.) There are some precautions to be adopted in determining longitudes chronometrically, which ought not to be neglected. It is well known that two observers will sometimes differ several tenths of a second from each other in getting the time at the same place and with the same instrument. Now this *personal equation*, if it exist between the observers at the two places, will affect the longitude by exactly its amount; hence the observers should be reversed for half the time of the experiment, if possible, or their *relative personal equation* found by comparison with each other, or, at least, with a third person. The accuracy of a chronometrical longitude depends on the distance in time between the places compared and the smoothness of the conveyance. It is decidedly the best mode where the distances do not exceed three or four days' journey, and where there are good carriage-roads or steam-boats. At sea, for voyages of moderate length, the Greenwich time may be taken almost entirely from chronometers, and if the number be considerable, and the watches good, there is little occasion for lunar distances, except for the greater caution, and to be assured against any accident affecting all the timekeepers the same way.

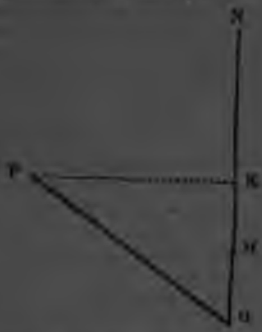
Determination of Greenwich Time by Signals.—Another mode of ascertaining differences of longitude is that of conveying the time from one point to another by fire-signals or rockets. Thus if a rocket is fired from a station between two observatories, and the explosion noted *in the time proper to each place*, the difference between the times will be the difference of longitude. A chain of such signals may be extended a considerable distance thus. Let the two points to be connected be A and B, and let an observer with a chronometer be placed at *a*, and others with rockets at α, β, thus: A, α, *a*, β, B. Then the observers at A and B note the rockets from α and β in times of their respective observatories. The person stationed at *a* notes by his chronometer the rockets at α and β (suppose β at 10 minutes after α), and as he observes α at the same

---

* In the first place chronometers are liable to accidents, and secondly, to change their rates, and that sometimes by jumps. With two chronometers evidence is given of error by their discrepance, and with three, the faulty chronometer may be detected. The best two day box-chronometers may be bought for 40 guineas, and the best gold and silver pocket-chronometers for 40 and 30 guineas respectively. There is an idle opinion that chronometers are not good pocket-watches. They are perhaps a little more liable to injury *when let fall*, than other watches, on account of the heavy compensated balance, but after wearing chronometers for years without any particular care, we believe that three good pocket-chronometers, not larger than common watches, will keep the time for a month, as well as it can be got by lunar distance.

[illegible] moment with A. A would see B, if it were visible, 16 minutes later than he does actually see a; and therefore the explosion of B is known in time proper to A's observatory; but it is also seen by B at the same moment in his time, and therefore the difference of longitude is obtained. In like manner any number of intermediate stations of observers and rockets may be interpolated between two distant points, A and B. *The relative personal equation of the observer at A and B* must be taken into account both as astronomers and observers of signals; but the personal equation of the intermediate observer does not affect the observation. In this way the longitude of Paris from Greenwich was determined. (*Phil. Trans.*)

Finally, the longitude and latitude of one place from another may be determined by measurements on the earth's surface, if the figure of the earth be sufficiently well known. The geodesical latitudes and longitudes are in many cases found not to agree with those found astronomically, owing, as it is supposed, to some variations in the density of the earth in the neighbourhood of the place of observation. It is however a convenient way of finding the latitude and longitude of points near a well-established observatory, and connected by trigonometrical survey.



Let the distance P G in feet and the bearing K G P of the point P from the observatory G be known by survey, and G N be an arc of the meridian. Then drawing P K perpendicular to G N, P K = P G × sin of P G K and G K = P G × cos P G K, when P K and G K are known in feet. Find the value of ½ K G in seconds of latitude approximately by supposing 1″ to be = 100·8 feet, and add or subtract this, as the case may be, to the latitude of G, which will give the latitude of M, the middle point; call this λ. Then the value in English feet of a degree of latitude at M is

$$362747\cdot7 + \text{number the logarithm of which} = \left\{\begin{matrix}3\cdot5634861\\ +\ 2\log\sin\lambda\end{matrix}\right.$$

and the value of a degree of longitude at the same parallel in English feet =

$$\text{number, log} = \left\{\begin{matrix}5\cdot5625161\\ +\ \log\cos\lambda\end{matrix}\right\} + \text{number, log} = \left\{\begin{matrix}3\cdot0859609\\ +\ \log\cos\lambda\\ +\ 2\log\sin\lambda\end{matrix}\right.$$

With these values of a degree of latitude and longitude the distances G K and P K are readily converted into arcs of latitude and longitude.

On this subject the reader may consult the 'Encyclopædia Metropolitana,' art. 'Figure of the Earth.'

The solution of the problems assumed to be known in the foregoing article may be found in all treatises on astronomy and in most collections of tables of navigation. We have recommended Thomson's 'Tables' as very convenient, and sufficiently accurate for the traveller and navigator, but any tables and methods which a man has become accustomed to will do. It would require too much space to give reasons and explanations for the opinions here advanced, but we will give two or three recommendations which few observers will regret to have followed. The first is to make, when practicable, large masses of careful and unhurried observations, and especially to observe the rules given above for nullifying instrumental error, by making such observations that a given error will have contrary effects in the result. Secondly, to be very careful in selecting their instruments and their timekeepers, which should come from good makers, and be carefully tried before starting, especially at such temperatures as the traveller may expect to meet with. A chronometer which is excellent for a polar expedition may be an indifferent watch on the Tigris or in the interior of Africa, and *versâ vice*. For any overland expedition three pocket chronometers should at least be taken, and the number must be increased according to the length, the difficulty, and the importance of the journey, and a liberal allowance made for stoppages, changes of rate, accidents, &c.: a belt of half a dozen chronometers would scarcely be felt to be an inconvenience. Lastly, if the traveller's object be chiefly that of determining exact positions, he should be careful to determine the longitudes of all his principal points by solar eclipses or occultations of fixed stars by the moon, if he cannot carry and fix a transit. At these points he should determine the rates of his chronometers for a new departure, and determine as much of the country as circumstances will allow by journeys of ten days or a fortnight, returning to the same place. When the principal points are well fixed (we speak of longitudes, for good latitudes may be got with almost any instrument, or by any person), the chronometers will fix every halting-place where the time is observed, and this may be got in a few minutes any fine night or morning or afternoon; and then the itineraries, compass bearings, marches, &c., and all the loose information on which too much of our geography is founded, will furnish valuable details in the proper place. The necessary apparatus is not very expensive or cumbrous, and with a little practice can be managed by a moderately intelligent and methodical person.

LONGLAND, or LANGELANDE, ROBERT, the reputed author of the 'Visions of Piers Plowman.' He was a secular priest, born at Mortimer's Cleobury in Shropshire, and was afterwards fellow of Oriel College in Oxford. He lived in the reigns of Edward III. and Richard II.; and, as Bale assures us, was one of the earliest disciples of Wicliff. Longland, according to the same author, completed the 'Visions' in 1369, when John Chichester was mayor of London. The poem here named consists of 'XX. Passus' (pauses or breaks), exhibiting a series of dreams supposed to have happened to the author on the Malvern Hills in Worcestershire. It abounds in strong allegorical painting, and censures with great humour and fancy most of the vices incident to the several professions of life, and particularly inveighs against the corruptions of the clergy and the absurdities of superstition; the whole written, not in rhyme, but in an uncouth alliterative versification. Of the 'Visions of Piers Plowman' there are two distinct versions, or rather two sets of manuscripts, each distinguished from the other by peculiar readings. Of one, no fewer than three editions were printed in 1550, by Robert Crowley; and one in 1561, by Owen Rogers, to which is sometimes subjoined a separate poem, entitled 'Pierce the Plowman's Crede,' a production of a later date than the 'Visions,' inasmuch as Wicliff, who died in 1384, is mentioned (with honour) in it as no longer living. Of the other version of the 'Visions,' the only edition is that published by Dr. Thomas Dunham Whitaker, 4to., London, 1813, who, in the following year, republished the 'Crede,' from the first edition of that poem printed by Reynold Wolfe, in 1553.

(Bale's *Script. Illustr.*, 4to., Bas. 1559, cent. vi., p. 474; Percy's *Reliques*, edit. 1794, ii. 272; Ellis's *Specim. of Engl. Poet.*, i. 147; Whitaker's edit. of *P. Ploughman*, *Introd. Disc.*)

LONGOBARDS, LONGOBARDI, *or* LANGOBARDI, a nation of antient Germany, mentioned by Tacitus (*German.*, 40) as a tribe of the Suevi; he describes them as few in number, but secured by their bravery against their more powerful neighbours. It appears that they lived east of the Elbe, towards the shores of the Baltic Sea. Warnefridus says that they came originally from Scandinavia, and that their name was Viniles, which was afterwards changed into that of Langobards, from two Teutonic words, *lang* and *bart*, 'long beards.' The Longobards joined Arminius against Maroboduus, king of the Suevi. (Tacit., *Annal.*, ii. 46.)

During the third and fourth centuries of our era the Longobards followed the general movement of the northern nations towards the south, and came to the banks of the Danube, where we find them acting as allies of Odoacer, king of Italy, whose dominion extended also over Noricum, and bordered on the region then occupied by the Longobards. The Longobards afterwards totally defeated and almost exterminated the Heruli; and about the middle of the sixth century they occupied part of Pannonia, under their king Audoin. Here they came in contact with the Gepidæ, a nation settled in Dacia, on the borders of the

Eastern empire, and which the Longobards, with the assistance of the Avari, a tribe of the Hunni, totally defeated. [ALBOIN.]

In the year 568 Alboin crossed the Julian Alps, near Forum Julii, and led the Longobards to the conquest of the plains of North Italy, which have ever since been called by the name of the conquerors. [LOMBARDY.] Pavia became the capital of the Longobards. Together with the Longobards there came into Italy thousands of men of other tribes, which followed the standard of Alboin, namely, Saxons, Suevi, Gepidæ, Bulgarians, Pannonians, Sarmatians, and others. (Warnefrid., b. ii., ch. 26.) After Alboin's death the chief of the Longobards elected Clefo as his successor, A.D. 573; but on his being murdered by a servant, eighteen months after, the nation became divided among a number of dukes, a duke of Ticino or Pavia, a duke of Friuli, a duke of Trento, a duke of Bergamo, a duke of Brescia, besides thirty dukes in so many other cities. Under these dukes the Longobards penetrated south of the Apennines, and conquered Tuscany, Liguria, Umbria, and part of Campania. The Byzantine emperors retained Ravenna, Rome and its duchy, Padua, Genoa, Apulia, Calabria, Naples, and the southern extremity of Italy with Sicily. 'The government of the dukes,' says Warnefrid, 'was very oppressive to the Roman or native inhabitants, many of whom were put to death, and the rest deprived of part of their property, and obliged to pay tribute for the rest.' After ten years of this disorderly dominion of the dukes, the Longobards chose for their king Autaris, son of Clefo, 586—592. His reign was prosperous: he repulsed the attacks of the Franks on one side, and of the Byzantines on the other; and he carried his arms into southern Italy, where he founded the dukedom of Benevento. After the death of Autaris, his widow Theodolinda, who was a daughter of the king of Boiaaria, or Bavaria, married Agilulfus, duke of Turin, who was acknowledged by the Longobards as their king. Agilulfus, through the persuasion of his wife, became a Catholic, most of his countrymen being Arians, and made peace with Gregory the Great, bishop of Rome. Theodolinda built the church and palace of Monza, where was deposited the iron crown (so called from a nail, said to be from the cross of our Saviour, which is riveted inside of the crown), which has served ever since for the coronation of the kings of Lombardy. Agilulfus took Cremona, Padua, and other towns which still sided with the Eastern emperor. Truces were repeatedly made between the Longobards and the Byzantines of Ravenna. Agilulfus died in 615, and was succeeded by his son Adaloaldus, under the regency of Theodolinda. Adaloaldus, ten years after, having lost his mother, was deposed, as the chroniclers say, because he was insane, and Ariovaldus was elected in his stead. Little or nothing is known of Ariovaldus, except that he reigned twelve years, and died A.D. 636. It was under his reign that Columbanus, the Irish monk and missionary, after passing through Helvetia and Rhætia, came into Italy and founded the monastery of Bobbio, near the Ligurian Apennines, which afterwards became celebrated for its wealth and its collection of MSS.

After the death of Ariovaldus, Rothar, son-in-law of Agilulfus, was elected in his place. Rothar was the first who made a compilation of the unwritten laws and usages of the Longobards, and published them in a kind of barbarous Latin, under the name of Edict, with his own preface and observations. This edict drew a marked distinction between the Longobards and the Roman or subject population, which continued to live under the Roman law. The distinction between the two races, the conquerors and the conquered, seems to have continued until the fall of the Longobard dominion. By a subsequent law of King Liutprand, who made considerable additions to the edict of Rothar, it was enacted that if a Roman married a Longobard woman, the children born from such a marriage were Roman, and followed the condition of the father. The laws of the Longobards resembled in their spirit those of the Burgundians, Franks, and other Teutonic races. Pecuniary compensation was awarded for most personal injuries, assaults, wounds, mutilation, and for homicide. Adultery and theft were punished with death. Emigration was forbidden, and sedition or mutiny was a capital crime. The judges were strictly warned against partiality or corruption, and enjoined to decide causes within a limited number of ys. Single combat or duelling was tolerated, though its ctice was characterised by Liutprand as absurd. Upon the whole, the laws of the Longobards were among the most rational and equitable of those of the northern nations which divided among themselves the ruins of the Western empire, and as such have received the commendation of Montesquieu, Gibbon, Johann Müller, and others.

With regard to the political system of the Longobards, it may be considered as a federation under an elective king, who was the chief of the nation, something like the subsequent confederation of the German empire. When Autaris was elected king, the dukes in a general assembly agreed to give one half of their revenues for the support of the royal office and state, but in other respects they acted as sovereigns in their respective duchies, each making wars and conquests on his own account, as appears by the chronicles and also by the letters of pope Gregory the Great. We find a duke of Benevento extending his conquests as far as Cotrone, the dukes of Spoleti taking several towns of Sabina, and the dukes of Friuli repeatedly engaged in deadly warfare against the Avari and Sclavonians, without the rest of the Longobards, or the king himself, intervening as parties in these quarrels. The orders and enactments of the king required the sanction of the people, or army (for the two words are used as synonymous) of the Longobards. The king was supreme judge and commander, but not absolute legislator. These relations were maintained with tolerable fairness among the Longobards themselves, but with regard to the treatment of their Roman subjects the case was somewhat different. Several modern writers, Giannone, Muratori, Denina, Bossi, and others, have considered the Italians, or 'Romans,' as they were called, under the Longobard dominion, as enjoying equal privileges with their Longobard masters; but Manzoni, in a very sensible and soberly written disquisition on the subject, has dispelled this delusion. (*Discorso sopra alcuni punti della Storia Longobardica in Italia*, annexed to Manzoni's tragedy of *Adelchi*.)

The 'Roman' or Italian subjects of the Longobards were looked upon as a conquered and subject race, not exactly like the Helots at Sparta, but still they had neither the same political nor civil rights as the conquerors; they had no voice in their assemblies; they had no appeal against the caprice of their Longobard rulers; they lived among themselves according to the Roman law, but in any affairs between them and the Longobards they were judged by Longobard judges and according to the Longobard law.

Rothar, having conquered the towns of the Thuscia Lunensis, or Riviera of Genoa, and defeated the troops of the exarch of Ravenna, died A.D. 653, and was succeeded by his son Rodoaldus, who after five years' reign was killed by a Longobard for having seduced his wife. Aripertus, a nephew of queen Theodelinda, being elected in his place, reigned till the year 661, when he died, and his two sons Pertharitus and Godebertus divided the supreme authority between them. Godebertus however conspired against his brother, who was obliged to run away; but Godebertus himself was killed by Grimoaldus, a chief from Benevento, who took possession of the crown, A.D. 662. Grimoaldus was an able and warlike usurper. He defeated the Franks, who had entered Italy, and had advanced to near Asti. Shortly after, Constans II., emperor of Constantinople, a grandson of Heraclius, having landed with an army at Tarentum with the intention of recovering Italy from the Longobards, took Luceria, and laid siege to Benevento, which Romualdus, son of Grimoaldus, was duke. Grimoaldus marched with an army to the assistance of his son, and obliged Constans to raise the siege and retire to Naples. Constans afterwards went to Rome, which was still subject to the Eastern emperors, and took away the ornaments of the churches. He then retired by the way of Reggio to Sicily, where he committed many acts of oppression, until at last he was smothered in the bath at Syracuse, A.D. 6[illegible]. All the records of those times concur to show that the provinces of Italy which were still subject to the Byzantine emperors were much worse governed than the dominions of the Longobards. Under the reign of Grimoaldus, Alse[illegible] or Alseck, a chief of Bulgarians, emigrated to Italy with a his tribe, and put himself under the protection of the Longobard king. The king sent him to his son the duke of Benevento, who assigned to him the towns and territories of Boianum, Sæpinum, Æsernia, and other places in the country of Samnium, which had remained desolate in consequence of the wars. Warnefridus (b. v. ch. 29) adds that the descendants of those Bulgarians continued there in his days, 'and although they spoke Latin, had not lost the use of the language of their ancestors;' a remarkable passage, which shows that the general language of Italy in the time of Charlemagne was still the Latin, and was adopted by the northern tribes which settled in the country.

Grimoaldus added several chapters of laws to the edict or compilation of Rothar, and after a successful reign of nine years died at Pavia, A.D. 671. After his death the exile Pertharitus, who had wandered as far as England, returned, and by universal consent resumed the crown. Pertharitus reigned seventeen years, and died in 688, leaving his son Cunipertus, who had married Ermelinda, an Anglo-Saxon lady. Cunipertus was driven away by Alachis, duke of Tarentum, but he returned, defeated and killed Alachis, and resumed the crown. In the meantime Romualdus, duke of Benevento, took Tarentum and all the neighbouring country from the Byzantines, and annexed it to his dominions. Cunipertus died in the year 700. His infant-son Linpertus was put to death by Aripertus, duke of Turin, who assumed the crown. Asprandus, whom Cunipertus had appointed guardian to his son, fled into Boiaria with Liutprand, the son of Asprandus. Nine years afterwards they returned at the head of an army of Bavarians, and after a battle, in which Aripertus was drowned in attempting to cross the Ticinus, Asprandus was acknowledged king of the Longobards; he died soon after, and his son Liutprandus succeeded him by common consent, A.D. 713.

Liutprandus reigned thirty-two years. He was the most illustrious of the Longobard kings. He took Ravenna and the Pentapolis, but afterwards made peace with the Byzantines and restored Ravenna, was friendly with the pope Zacharias and the people of Rome, who at that time were alienated from the Eastern emperors in consequence of the schism of the Iconoclasts; and he was also friendly with Charles Martel, to whom he sent assistance against the Saracens, who had entered Provence in the year 739. Liutprand raised many churches and other buildings. 'He was,' says Warnefrid, 'valiant in war, but fond of peace; of a forgiving disposition; although destitute of learning like most of his countrymen, yet gifted with judgment and perspicacity, and worthy of being compared with philosophers; careful of the welfare of his people, and a legislator.' His laws are joined to those of his predecessors Rothar and Grimoald, in the collection of the laws of the Longobards. Liutprand died in 744, and was succeeded by his nephew Hildebrand, who was deposed a few months after for his misconduct, when Ratchis, duke of Friuli, was elected king. Ratchis, after five years' reign, voluntarily renounced the crown, and went to Rome, and afterwards to Monte Casino, where he became a monk. Ratchis was succeeded by his brother Astolphus. The first years of the reign of Astolphus were peaceful as long as Zacharias, a prudent and upright pope, continued to live. After the death of Zacharias, Stephen II. succeeded him, who began to intrigue with Pepin, king of the Franks, who wished to extend his power into Italy. Astolphus, on his side, having taken Ravenna in 751, and put an end to the dominion of the Exarchs, attacked the duchy of Rome, and aimed at subjecting that city also to his authority. Pepin came twice to the assistance of the pope, and each time defeated Astolphus near Pavia, and obliged him to give up Ravenna, the Pentapolis, and other towns, which Pepin is said to have then bestowed upon the Roman see. This donation however has been a subject of much controversy: the instrument does not exist, but is said to have been lost. Astolphus died in 756, and Desiderius, a Longobard duke, was elected his successor. Desiderius renewed the quarrel of Astolphus with the pope, and not only seized the towns given up by Astolphus, but likewise devastated the duchy of Rome. The pope Adrian I. applied to Charlemagne for assistance. Charlemagne came into Italy A.D. 774, defeated Desiderius, and carried him prisoner into France, where he became a monk. Adelchis, son of Desiderius, fled to Constantinople, from whence he returned to Italy with some troops, and fell in battle. The kingdom of the Longobards ended with Desiderius, and the Longobard nation and its territories became subject to Charlemagne.

The political system of the Longobards was weak: 1st, because their king was elective; 2nd, because the state was divided among so many almost independent dukes; 3rd, because it established a degrading inferiority between themselves and the native cultivators of the soil; 4th, because it never could or would enter into a fair alliance with the hierarchy of Rome, whose power was growing very fast in the opinion of the Italians or 'Romans,' both of the Longobard and other territories of Italy. The popes were in fact the protectors and the hope of the degraded Roman population, and this contributes to explain the facility with which Charlemagne in one single battle overthrew the whole dominion of the Longobards.

LONGOMONTA'NUS. CHRISTIAN SEVERIN, better known as Christian Longomontanus, from the latinized form of his native village, Langsberg, in Denmark, was born in the year 1562. His early education was probably wholly due to his own exertions, as the circumstances of his father, who was a poor ploughman, would scarcely have enabled him to incur much expense on that account; but upon the death of this parent, which took place when he was only eight years old, he was sent for a short time to a good school by his maternal uncle. This improvement in young Severin's condition excited so much jealousy among his brethren, who thought themselves unfairly dealt with, that he determined, in 1577, upon removing to Wiborg, where he lived eleven years, 'working by night to earn a subsistence, and attending the lectures of the professors during the day.' After this he went to Copenhagen and there became known to Tycho Brahé, who employed him in reducing his observations and making other astronomical calculations up to the time of his quitting the island of Hoëne in 1597, when he sent him to Wandenbourg, and thence to his residence at Benach, near Prague. His stay here was not of long duration, in consequence, it is said, of his attachment to his native country, though it is perhaps attributable to the death of his patron, which happened in 1601. [BRAHE', TYCHO.] He returned by a circuitous route, in order to visit the place which had been honoured by the presence of Copernicus, and reached Wiborg about the year 1603, where he was appointed superintendent (recteur) of the gymnasium, and two years after was promoted to the professorship of mathematics in the university of Copenhagen, the duties of which he continued to discharge till within two years of his death. He died at Copenhagen, 8th October, 1647.

The following list of his published works is taken from the 18th volume of the 'Mémoires des Hommes Illustres,' Paris, 1732; 'Theses summam doctrinæ Ethicæ complectentes,' 1610; 'Disputatio Ethica de Animæ Humanæ Morbis,' 1610; 'Disputationes duæ de Philosophiæ origine, utilitate, definitione, divisione, et addiscendi ratione,' 1611-18; 'Systematis Mathematici,' part 1; 'Arithmeticam Solutam duobus libris methodice comprehendens,' 1611; 'Cyclometria è Lunulis reciproce demonstrata, unde tam areæ, quam perimetri Circuli exacta dimensio et in numeros diductio secuta est, hactenus ab omnibus Mathematicis unice desiderata,' 1612, 1627, and 1664; 'Disputatio de Eclipsibus,' 1616; 'Astronomia Danica in duas partes tributa, quarum prima doctrinam de diuturna apparente Siderum Revolutione super Sphæra armillari veterum instaurata duobus libris explicat; secunda Theorias de Motibus Planetarum ad Observationes Tychonis de Brahé, &c. itidem duobus libris complectitur,' 1622, 1640, and 1663 (Gassendi, in his Life of Tycho Brahé, says that this work belongs rather to that astronomer than to Longomontanus, since the tables of the planetary motions were either calculated by Longomontanus under the immediate superintendence of Tycho, or copied by him from those which Tycho had previously caused to be computed); 'Disputationes quatuor Astrologicæ,' 1622; 'Pentas Problematum Philosophiæ,' 1623; 'De Chronolabio Historico,' 1627; 'Disputatio de Tempore trium Epocharum, Mundi Conditi, Christi Nati, et Olympiadis primæ,' 1629; 'Zetemata septem de summo hominis bono,' 1630; 'Disputatio de summo hominis malo,' 1630; 'Geometriæ quæsita xiii. de Cyclometria rationali et vera,' 1631; 'Inventio Quadraturæ Circuli,' 1634 (this work gave rise to a very animated dispute between the author and Dr. John Pell, an English mathematician, who proved that the demonstration there given of the quadrature of the circle was fallacious, but notwithstanding Longomontanus died in the conviction that he had effected that which has since been shown to be impracticable); 'Disputatio de Matheseos Indole,' 1636; 'Coronis Problematica ex Mysteriis Trium Numerorum,' 1637; 'Problemata duo Geometrica,' 1638; Problema contra Paulum Guldinum de Circuli Mensura,' 1638; 'Introductio in Theatrum Astronomicum,' 1639; 'Rotundi in Plano, seu Circuli absoluta Mensura,' 1644; 'Energeia Proportionis sesquitertiæ,' 1644; 'Controversia cum Pellio de vera Circuli Mensura,' 1645. (Hntton's *Dictionary; Biog. Univers.*)

LONGUS is the name of the author, or supposed author, of a Greek pastoral romance, 'The Loves of Daphnis and Chloe,' or, according to the literal version of the Greek title (*Ποιμενικὰ τὰ κατὰ Δάφνιν καὶ Χλόην*), 'Pastoral Matters concerning Daphnis and Chloe,' which has been generally admired for its elegance and simplicity, and is one of the earliest specimens of that kind of composition. We know nothing of the author, who is supposed to have lived in the fourth or fifth century of our æra. The 'Daphnis' of Gesner approaches the nearest of any modern composition to an imitation of the work of Longus. This pastoral has gone through numerous editions, the best of which are: that of Leipzig, 1777, called 'Variorum,' because it contains the notes of former editors; Villoison's, with numerous notes by the editor, Paris, 1778; Schæfer's, Leipzig, 1803; that of Courier, Rome, 1810; that of Passow, Leipzig, 1811, Greek and German; and by Sinner, Paris, 1829. Courier discovered in the MS. of Longus, in the Laurentian library at Florence, a passage of some length, belonging to the first book, which is wanting in all the other MSS. He first published the fragment separately at his own expense and distributed the copies gratis. He afterwards embodied it in his edition of the whole pastoral, of which he published only 52 copies, most of which he sent to distinguished scholars of various countries. He also republished Amyot's French translation of Longus, adding to it the translation of the discovered passage. [COURIER, PAUL LOUIS.]

LONGWY. [MOSELLE.]

LONS-LE-SAUNIER. [JURA.]

LOO-CHOO ISLANDS. [LIEOU-KIEOU ISLANDS.]

LOOE, EAST AND WEST. [CORNWALL.]

LOON (Ornithology), one of the English names for the Greatest Speckled Diver, *Colymbus glacialis*. [DIVER, vol. ix., p. 37.]

LOP, Lake. [TURKISTAN.]

LOPE DE VEGA. [VEGA.]

LO'PHIADÆ, a family of fishes of the order Acanthopterygii. The fishes of this family (which forms the '*Pectorales Pédiculées*' of Cuvier) are distinguished by the bones of the carpus being elongated and forming a kind of arm, which supports the pectoral fins. The skeleton is semicartilaginous. The family contains four genera: *Lophius* (Cuv.), *Antennarius* (Commerson), *Malthe* (Cuv.), and *Batrachus* (Bloch., Schn.)

The extraordinary fish which is not unfrequently met with on our coast, and known by the name of the Angler (*Lophius piscatorius*, Lin.), is an example of the first of the above genera, which is thus characterized:—Skin without scales; the ventral fins situated in front of the pectorals; opercule and branchiostegous rays enveloped in the skin; gill-opening situated behind the pectorals; branchiostegous membrane forming a large purse-like cavity in the axilla; two distinct dorsal fins, in front of which are some free rays produced into long slender filaments: head broad and depressed, extremely large in proportion to the body.

The Angler, or Fishing Frog, as it is sometimes called, is thus described by Mr. Yarrell:—'The head is wide, depressed; the mouth nearly as wide as the head; lower jaw the longest, bearded or fringed all round the edge; both jaws armed with numerous teeth of different lengths, conical, sharp, and curving inwards; teeth also on the palatine bones and tongue; three elongated unconnected filaments on the upper part of the head, two near the upper lip, one at the nape, all three situated on the middle line; eyes large, irides brown, pupil black; pectoral fins broad and rounded at the edge, wide at the base; branchial pouches in part supported by the six branchiostegous rays. Body narrow compared with the breadth of the head, and tapering gradually to the tail; vent about the middle of the body; the whole fish covered with a loose skin. The number of fin-rays are:—dorsal, 3 spinous and 12 soft; pectoral, 20; ventral, 5; anal, 8; and caudal, 8. Colour of the upper surface of the body uniform brown; fin membranes darker; under surface of the body, ventral and pectoral fins, white; tail dark brown, almost black.'

The Angler is usually about three feet in length, but has been known to measure five. It lives at the bottom of the water, crouching close to the ground; and, by means of its ventral and pectoral fins, it stirs up the mud and sand in such a manner as to conceal itself from other fishes. The long filament at the tip of the nose is elevated, and the glittering appendage at its extremity is said to attract the smaller fishes as a bait; and when they are sufficiently near, they are seized by this voracious fish.

In the genus *Antennarius* there is the same sort of free rays on the head, the first of which is slender, often terminated by an appendage; the following rays, augmented by a membrane, are sometimes much enlarged, and at others are united to form a fin. The dorsal fin occupies nearly the whole extent of the back; the body is often beset with cutaneous appendages. These fishes, says Cuvier, by filling their enormous stomachs with air, expand themselves like a balloon; their fins enable them to creep on land, where they can live for two or three days, the pectorals, from their position, performing the functions of hind feet. These fishes inhabit the seas of hot climates.

The species of the genus *Malthe* are remarkable for their projecting snout, beneath which the mouth, which is of moderate size and protracted, is situated. The body is studded with bony tubercles, and the dorsal fin is small.

The fourth and last genus of the present family (*Batrachus*) is distinguished by the following characters:—Head horizontally flattened, broader than the body; the mouth deeply cleft; operculum and suboperculum spinous; the ventral fins narrow, inserted under the throat, and containing but three rays, the first of which is broad and elongated. The anterior dorsal fin is short, and supported by three spinous rays; the posterior dorsal is long, and supported by soft rays; the anal fin, which is opposed to the last, is also supported with soft rays. The lips are frequently furnished with filaments. The species of this genus keep themselves hidden in the sand to surprise their prey, like those of the genus Lophius, and the wounds inflicted by their spines are said to be dangerous.

LO'PHIODON, an extinct genus of mammiferous quadrupeds nearly approaching in the structure of the teeth to the Tapirs and Rhinoceroses, and in some respects to the Hippopotamus, separated by Cuvier from *Palæotherium* (with which, as well as *Anoplotherium*, it is closely connected) under the name at the head of this article. M. de Blainville named the genus *Tapirotherium*.

Lophiodon differs from *Palæotherium* in that the lower molar teeth, instead of exhibiting a continuous series of double crescents running longitudinally, have transversal elevations (des collines transversales), more or less oblique. Cuvier gives the following as the generic characters of *Lophiodon*:—

1. Six incisors and two canines in each jaw; seven molars on each side of the upper jaw and six in the lower, with a vacant space between the canine and the first molar: points in which they resemble the Tapirs.

2. A third elevation (colline) on the last lower molar, which is wanting in the Tapirs.

3. The anterior lower molars are not furnished with transversal elevations as in the Tapirs, but present a longitudinal series of tubercles, or a conical and isolated one.

4. The upper molars have their transversal elevations more oblique, and in this respect approach the Rhinoceroses, from which they differ by the absence of *crochets* on these elevations.

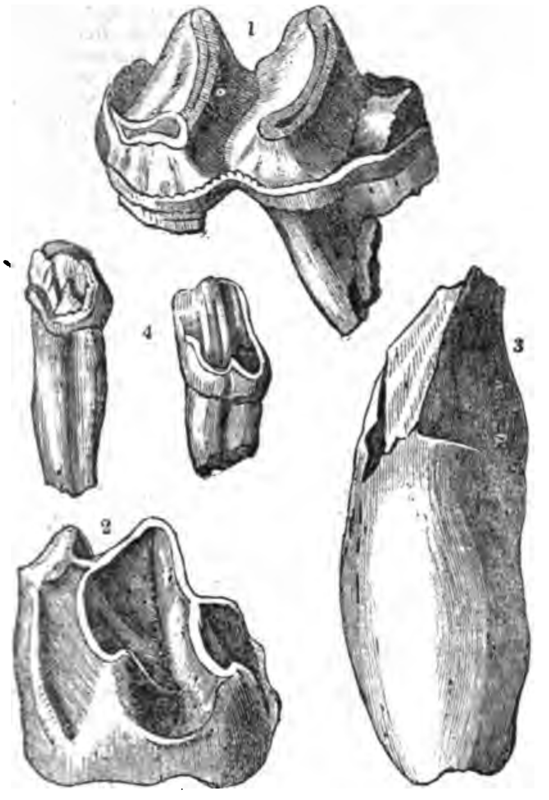
The dental formula of *Lophiodon* then will be:—

$$\text{Incisors } \frac{6}{6}; \text{ Canines } \frac{1-1}{1-1}; \text{ Molars } \frac{7-7}{6-6} = 42.$$

The rest of the osteology of this extinct form indicates the affinities above mentioned; but many parts of the skeleton are still unknown, and particularly those essential portions the nasal bones and those of the feet, the number of toes not being ascertained.

No less than fifteen species are recorded, twelve of which are named. They belong to the first great fresh-water formation of the Eocene Period of Lyell; and if we are to judge from analogy, and the other animal remains (those of reptiles especially) with which they are associated, they must have lived in a temperature suitable to the existence of Crocodiles and fresh-water *Testudinata* (*Emys* and *Trionyx*), creatures which, at present, inhabit warm climates.

The localities are Issel for three species, one of which is also found at Eppleshcim and another also at Argenton and Soissons. Argenton for three other species. Buchsweiler for two more. Montabusard for two more, one of which is also found at Gannat. Boutonnet near Montpellier for one. Orenburg,[*] for one (*L. Sibiricum* of Fischer): these species are named. Others have been found at Argenton, in the Laonnois, near Paris, and near Frankfort.



1, lower back molar, from the great species of Lophiodon of Argenton. (Cuv.) 2, upper molar (back) of the same. (Cuv.) 3, canine tooth of the same. (Cuv.) 4, incisor teeth of the same. (Cuv.)

In the 'Règne Animal,' Cuvier places *Lophiodon* between *Palæotherium* and the *Tapirs*.

LOPHORI'NA. [BIRD OF PARADISE, vol. iv., p. 421.]

LOPHO'PHORUS. [PHASIANIDÆ.]

LO'PHOTES, a genus of *Falconidæ* established by M. Lesson; but that term having been previously employed,[†] Mr. Gould and others adopt the generic title, *Lepidogenys*, proposed by Mr. J. E. Gray. Mr. Gould describes a species among his Australian Birds under the name of *Lepidogenys cristatus*. The form is somewhat allied to *Pernis*. Mr. Gould characterized at the same time several new species of *Falconidæ* from New South Wales, and the following new genus from the same locality.

Ieracidea.—Type, *Falco Berigora.* Vig. and Horsf. (*Zool. Proc.*, 1837.)

LOPHOTUS, a name applied by G. Fischer to a genus of *Simiadæ*

LOPHU'RA, a genus of Saurians established by Mr. Gray, but changed by Cuvier for *Istiurus*, because in his opinion the term *Lophura* comes too near to the term *Lophyrus*. The terms are however both in their construction and accentuation sufficiently distinct. [IGUANIDÆ, vol. xii., p. 439.]

LOPHY'ROPA. [BRANCHIOPODA, vol. v., p. 339.]

LO'PHYRUS. [COLUMBIDÆ, vol. vii., p. 377.] The term is also employed by Duméril to designate a genus of *Saurians* (*Aguma gigantea*, Kuhl.), and by Latreille as a name for a genus of *Hymenopterous Insects*.

LORANTHA'CEÆ, a natural order of Exogens, referred by most systematical writers to either the polypetalous or monopetalous subclass, but by others regarded as more closely in alliance with the apetalous Santalaceæ and Proteaceæ. They are in nearly all cases true parasites, growing upon the branches of trees, below whose bark they insert their roots, incorporating them with the wood, and feeding upon the vital juices of the plants which they attack. The principal marks of distinction in the structure of Loranthaceæ are a one-celled inferior fruit containing a single erect ovule, a fruit consisting of a peculiar viscid matter resembling birdlime, and a valvate corolla with the stamens opposite the petals. There is but one species, the common mistletoe, Viscum album, found wild in England; a species of Loranthus occurs in the south of Europe; but in the hot dry parts of tropical countries the species abound, swarming over the branches of trees, of which they often form a conspicuous feature, with their long clustered gaily coloured flowers. As in this country the mistletoe does not injure in any considerable degree the plant which it attacks, unless it exists in unusual quantity, so in India, where Loranthi are common, the injury sustained by vegetation is according to the reciprocal size of the parasite and its stock. Mr. Griffith states that a species called Loranthus Scurrula, which is generally attached to Melastoma malabathrica, or other shrubs, frequently destroys them to a considerable extent; others which are minute in comparison with the stock, especially such as grow upon trees, produce no appreciable injury. Although the nature of the pericarp of plants seldom forms a part of their ordinal distinctions, yet it is here employed—for this reason, that the viscidity of the fruit and the parasitical habits of the order are dependent on each other. The seeds sticking by their own glue to the branches on which they fall ensure to the young parasite, when it begins to grow, a suitable substance in which to push its roots; and as the viscidity of the fruit causes the greater part of it to catch upon branches before it falls to the ground, the young plant would die immediately after germination, if it were not a parasite, and thus the race would become extinct.

Mr. Griffith has shown (*Linn. Trans.*, xviii. 71) that in Loranthus and Viscum the ovules are not formed till after impregnation has taken place, a most curious and before unheard-of fact.

LORCA, a town of Spain in the province of Murcia, in the diocese of Carthagena, is built on the north slope of the Sierra de Caño, 40 miles west of Carthagena. It has an old castle, a collegiate church, besides other churches and convents, a royal college, an episcopal palace, two hospitals, several 'alamedas,' or public walks, planted with fine trees, and, according to Miñano, 40,000 inhabitants. It has manufactories of saltpetre, woollen and linen cloths, thread, and lace. The territory of Lorca is very fertile, especially in corn, but part of it suffers from drought. Various means have been tried to supply the deficiency of water, but they have failed through bad management and the political convulsions of the country. (Miñano, *Diccionario Geografico de España.*)

LORD ADVOCATE OF SCOTLAND. This is the peculiar appellation of the attorney-general, or senior standing counsel for the crown, learned in the law, in Scotland. The regular series of such officers cannot be carried to an earlier date than the end of the fifteenth century. Previous to that time, indictments before the lord-justiciar of Scotland seem to have been under the charge and superintendance of the clerk of court, or justice clerk, as he was termed [JUSTICE CLERK]; and for prosecutions before the high court of parliament, we find sometimes the chancellor, sometimes the clerk register, and at other times a special counsel for the crown appointed.

The earliest standing 'Advocate,' and with whom the series properly begins, was Sir John de Ross of Montgreenan, in the county of Ayr, an individual well known both in the politics and literature of his time: he is one of the Scottish poets commemorated by Dunbar. On the fall of Henryson and Lawson on the fatal field of Flodden, Wishart of Pittarrow was made both king's advocate and justice-clerk; but afterwards those offices were again separated, and when the Court of Session was erected in the beginning of the sixteenth century, Sir Adam Otterburn of Auldhame was king's advocate. On that occasion he was not only privileged to plead within the bar, but actually nominated one of the judges of the court, or a lord of session, as the king's treasurer and justice-clerk likewise were. It was from this circumstance he acquired the style of Lord Advocate, an appellation which occurs in the years 1573 and 1576 (Pitcairn's *Criminal Trials*), and was the fixed designation in 1587. (See the statute, 1587, c. 115.) This was in the time of David M'Gill of Rankielor; and before M'Gill had long left the office, it had the additional style of 'Right Honourable.' (See Act of Sederunt, 17th Nov.,

---

[*] Kalkstein im Orenburger Gouvt. Dr Hermann Von Meyer places a note of interrogation after 'Tertiär.'

[†] By Giorna to designate a genus of Acanthopterygious fishes.

1610.) It was however in the time of Sir Thomas Hope (founder of the noble family of Hopetoun, and others) that the office acquired the vast political importance which has in modern times belonged to it This arose not less from the subtle and ambitious character of that famous person, than from the circumstance of the king's removal to the throne of England, and the consequent remoteness of Scotland from the immediate seat of government.

In M'Gill's time the yearly salary attached to the office was 40*l*. When Hope was appointed in 1628, he had 200*l*. a year; and in the end of last century it was 1500*l*.

It is difficult to define the powers and duties of the lord advocate; they are said to be indefinable. The most prominent however is that of public prosecutor; and in this capacity he has, besides the solicitor-general, four standing deputies of his own appointment, who retire with him on a change of ministry. These deputies assist him in the Court of Justiciary, and are despatched by him to the several circuits of that court to prosecute indictments there. He has also a deputy in the Court of Exchequer; and a deputy or occasional substitute to conduct prosecutions before the sheriff of Edinburgh, or other county court. Every county court has indeed a 'procurator fiscal,' whose duty it is to sue on behalf of the crown in his county; but that officer is not yet placed on a proper footing, being neither of the bar, nor named by the crown or the lord advocate.

LORD-KEEPER (Custos magni Sigilli), an antient officer of the crown, who had the custody of the king's great seal, with authority to affix it to public documents, some of the most important of which have no force till they have been authenticated in this formal manner.

Until the reign of Henry III. the office of keeper of the great seal appears to have been distinct from that of chancellor, and generally subordinate to it. The chancellor, as a high judicial officer, was sworn at his entrance upon his duties, but the functions of the keeper being considered as chiefly ministerial, no oath appears to have been required from him. The chancellor was often elected by the baronage parliament, or great council of the nation, but the custody of the great seal was under the control of the king The antient entries respecting the appointment of the chancellor generally are—A. B. Cancellarius (or in Cancellarium) Angliæ electus, or a baronagio, or in pleno parliamento, or per regem et parliamentum, constitutus est. Records of the reign of Henry I. and John show that both offices were held simultaneously by different persons under those princes. Sometimes the offices were united in one individual, who was thus both judge and minister. In the 11th year of Henry III., Ralph Nevill was appointed by parliament chancellor for life; and two years afterwards he received the custody of the great seal from the king. In 22 Henry III. the great seal was forcibly taken from Nevill by the king, who delivered it to two persons, Geoffrey the Templar and John Lexington; but as Nevill could not be deprived of his judicial authority by the crown, he continued to hold the office of chancellor until his death. But the great seal was under the control of the chancellor; and when Henry III. demanded it from the bishop of Chester, his chancellor, he answered, that having received the seal by the common council of the realm, he could not resign it to any one without the like common consent. It was matter of complaint against Henry III. that in 1261 he appointed Walter de Merton to be chancellor, 'inconsulto baronagio,' or without the consent of the baronage. In the following year he appears to have removed Hugh le Despencer the chief-justice, and Nicholas de Ely the chancellor, appointed by the barons.

Edward I. took the great seal with him into Flanders, and afterwards into Gascony, leaving his chancellor in England with a temporary seal: and in 6 Edward I. the bishop of Bath and Wells, the chancellor, on going abroad left the great seal in the custody of Sir John de Kirby, with an injunction to despatch the business of the chancelly in his absence. The chancellor cannot now make a deputy, or, as he was formerly called, a lieutenant. In 16 Edw. I., Ayremin, master of the rolls, and his companions, were keepers of the great seal; Burnell, bishop of Bath and Wells, being at the same time chancellor. Among the restrictions imposed on Edward II., in the fifth year of his reign, by the ordeinours elected by the barons and commons in parliament, it was provided that the king should point the chancellor and certain other great officers by advice and assent of his baronage, and in parliament. This seems to have been the last interference with the royal authority over the appointment of chancellor until the time of the Long Parliament. In the more vigorous reign of Edward III. we find by the parliament roll that in 1343 the commons prayed that no alien might be made chancellor, but the king answered, that he could appoint whom he would. In 3 Richard II. the Commons prayed that the chancellor, treasurer, keeper of the great seal, chief chamberlain, and steward of the king's household might be appointed in that parliament. Henry V. had two great seals, one of gold, which he delivered to the bishop of Durham, making him *lord chancellor* of England, and another of silver, which he delivered to the bishop of London to keep. The statute of 31 Henry VIII., c. 10, assigned the same rank to the lord chancellor and the lord-keeper, giving to the person holding the one office or the other precedence over all lay peers except those of the blood royal; and in 5 Elizabeth, Sir Nicolas Bacon lord keeper, procured an act to be passed (c. 18), which, after reciting that a question had *of late* arisen whether like place, authority, pre eminence, jurisdiction, and power belonged to the office of lord-keeper of the great seal of England, as belonged to the office of lord-chancellor of England, declares that the keeper of the great seal has always had, used, and executed the same place, authority pre-eminence, jurisdiction, execution of laws, and all other customs, commodities, and advantages as the lord-chancellor.

Notwithstanding these two statutes the appointment of lord-keeper appears not to have stood so high in the estimation of the public as that of chancellor; and the great seal has been generally delivered with the latter title.

Upon the rupture between Charles I. and his parliament the king took the great seal to Oxford, upon which a new seal was ordered to be made by the parliament. This measure was the subject of severe reproaches from the royalists; though unless the parliament were prepared to submit unconditionally to the king, it is difficult to say how any other course could have been adopted.

(Matth. Paris; *Parliament Rolls;* Coke's 4th *Inst.*; Bohun's *Cursus Cancell.*)

The power and duties of the lord-keeper, as identified with the chancellor, have already been stated. [Chancellor; Chancery.]

LORD-LIEUTENANT. It was formerly usual for the crown, from time to time, to issue commissions of array requiring certain experienced persons to muster and array the inhabitants of the counties to which such commissioners were sent. They were directed to put into military order those who were capable of performing military service, and to distrain such as were not qualified to serve, but were possessed of real or personal property, to furnish armour to their more vigorous countrymen; and they were to erect beacons where necessary. The form of these commissions, after much complaint, was settled by statute, and may be seen at length in the Parliament-rolls of 5 Hen. IV., 1403-4, vol. iii., p. 527.

In the 16th century these commissions of array appear to have generally given place to commissions of lieutenancy, by which nearly the same powers as those of the old commissions of array were conferred on certain persons as standing representatives of the crown for keeping the counties for which they were appointed in military order. In 1545 a commission 'de arraiatione et capitaneo generali contra Francos' issued to the duke of Norfolk, constituting him the king's *lieutenant*, and captain-general of all captains, vice-captains, men-at-arms, armed men, archers, and all others retained or to be retained against the French in the counties of Essex, Suffolk, Norfolk, Hertford, Cambridge, Huntingdon, Lincoln, Rutland, Warwick, Northampton, Leicester, and Bedford. A similar commission issued to the duke of Suffolk for the counties of Kent, Sussex, Surrey, Hants, Wilts, Berks, Oxford, Middlesex, Bucks, Worcester, and Hereford, and London; and to John Russell, knight, Lord Russell, keeper of the privy seal, for the counties of Dorset, Somerset, Devon, Cornwall, and Gloucester. (Rymer.)

These officers are however spoken of by Camden, in the reign of Elizabeth, as extraordinary magistrates, constituted only in times of difficulty and danger, which was the case with commissioners of array, as appears from the recitals of their commission.

The right of the crown to issue commissions of lieutenancy was denied by the Long Parliament, and the question formed the proximate cause of the rupture between Charles I. and his subjects. Upon the Restoration the right of the crown to issue such commissions was established by a declaratory act, 14 Charles II., cap. 3.

The authorities and duties of the lord-lieutenant and of his temporary vice-lieutenants, and of his permanent deputy-lieutenants, have latterly been fixed and regulated by the militia acts. [MILITIA.]

LORD OF MISRULE, the master of the revels at Christmas in any nobleman's or other great house. 'First in the feast of Christmas,' says Stowe (*Surv. of Lond.*, edit. 1603, p. 98), 'there was in the king's house, wheresoever he was lodged, a Lord of Misrule, or master of merry disports, and the like had ye in the house of every nobleman of honor or good worship, were he spiritual or temporal: amongst the which the mayor of London, and either of the sheriffs, had their several Lords of Misrule, ever contending, without quarrel or offence, who should make the rarest pastimes to delight the beholders. These lords, beginning their rule on Alhallow-eve, continued the same till the morrow after the Feast of the Purification, commonly called Candlemas-day: in all which space there were fine and subtle disguisings, masks, and mummeries, with playing at cards for counters, nailes, and points in every house, more for pastimes than for gain.'

This Lord of Misrule, or revel-master, was sometimes termed a Christmas prince. Warton, in his 'History of English Poetry,' tells us that in an original draught of the statutes of Trinity College at Cambridge, founded in 1546, one of the chapters is entitled, 'De præfecto Ludorum, qui *Imperator* dicitur,' under whose direction and authority Latin comedies and tragedies are to be exhibited in the hall at Christmas; as also 'sex spectacula,' or as many dialogues. With regard to the peculiar business and office of Imperator, it is ordered that one of the Masters of Arts shall be placed over the juniors every Christmas, for the regulation of their games and diversions at that season of festivity. His sovereignty was to last during the twelve days of Christmas, and he was to exercise the same power on Candlemas-day. His fee was forty shillings. In an audit-book of Trinity College in Oxford, for the year 1559, Mr. Warton found a disbursement 'pro prandio *Principis Natalicii*.' A Christmas Prince or Lord of Misrule, he adds, corresponding to the Imperator at Cambridge, was a common temporary magistrate in the colleges at Oxford.

In Scotland, where the Reformation took a more severe and gloomy turn than in England, the 'Abbot of Unreason,' as he was there called, and other festive characters, were suppressed by the legislature as early as 1555. At Rodez, the capital of the province of Rovergne in France, previous o the Revolution, they had an 'Abbé de la Malgouverné,' who corresponded exactly with our Lord of Misrule.

After 1640 we hear nothing of the Lord of Misrule in England.

(Warton's *Hist. Engl. Poetry*, vol. ii., p. 378; Brand's *Popular Antiq.*, vol. i., p. 387-393; Nares's *Glossary*.)

LORDS, HOUSE OF,—one of the two assemblies which form together the Parliament of the United Kingdom. [PARLIAMENT.] The other is the House of Commons, which consists of persons who are elected from time to time o represent the people at large. [COMMONS, HOUSE OF.]

The persons who sit in the House of Lords are of two classes: 1, Lords Spiritual; 2, Lords Temporal.

The Lords Spiritual are the two archbishops and twenty-four bishops of the English Church, and one archbishop and three bishops of the Irish prelacy. Before the reformation of religion, when the monastic establishments which abounded in England were suppressed, the superiors of many of them, under the names of abbots and priors, sat as Lords Spiritual in this assembly. In those times the Lords Spiritual equalled, if they did not outnumber, the Lords Temporal who sat at any given time in Parliament; though now they form but about one-thirteenth of the persons composing this assembly. Six more bishops were added when the abbots and priors were removed.

The Lords Temporal are all the peers of England, being of full age, and not incapacitated by mental imbecility; sixteen representative peers of the Scottish peerage, and twenty-eight representatives of the Irish peerage. The number of the two last-named portions is fixed; but the number of peers of England sitting in the house is perpetually varying, and depends upon the casualties of minorities, and on the will of the king, who has an unrestricted power of increasing the number of peers.

The Scottish representative peers were introduced at the Union in 1707; and the Irish representative peers at the Union with that country in 1800.

The component parts of this assembly admit of being represented thus:—1. Persons sitting there in respect of offices held by them. Such are the spiritual lords of England. 2. Persons who sit in right of inheritance of a dignity of peerage. 3. Persons who have been created peers. 4. Hereditary peers of Scotland (for there can be no creation of peers of that part of the United Kingdom) elected by the whole body of the Scottish peerage to represent them in parliament, at the beginning of every parliament. 5. Hereditary or created peers of Ireland, elected by the whole body of the Irish peerage, and sitting for life, vacancies being supplied as they occur. And 6. Spiritual lords of Ireland, who sit in turns according to a cycle established at the Union. The great body of the house however consists of hereditary Lords Temporal of England, under the several denominations of dukes, marquisses, earls, viscounts, and barons. Each of the individuals of these ranks has an equal vote with the rest; but they are seated in the house in classes, and according to their precedency.

The only material changes which have been made in the constitution of this assembly in the long period of its existence have been: 1. The supposed limitation of the right of all holding lands in chief of the crown to sit therein, by King Henry III. after the battle of Evesham. 2. The removal from it of representatives of the counties, cities, and boroughs, who are supposed to have formerly sat with the lords, and the placing them in a distinct assembly, called the House of Commons. 3. The reduction in the number of the Lords Spiritual, by the suppression of the monastic establishments. 4. The introduction of the Scottish representative peers. And 5. The introduction of the Irish bishops and the Irish representative peers.

This house may be traced to the very beginning of anything like an English constitution. It is in fact the *magnum concilium* of the early chronicles. The bishops are sometimes said to sit there in virtue of baronies annexed to their respective offices; but it is questionable whether baronies are attached to the bishoprics of the new creation by Henry VIII.: and at best it is but a legal fiction, it being evident from the whole course of history that the bishops formed, as such, a constituent part of such assemblies in the Saxon times, and were, as such, among the chief advisers of the sovereign. One of the last acts of king Charles I., before he finally left London and disconnected himself from the Parliament, was to give the royal assent to a bill for removing the bishops from Parliament.

A question has been raised whether as the Lords Spiritual and the Lords Temporal, though sitting together, form two distinct *estates* of the realm, the concurrence of both is not requisite in any determination of this house, just as the consent of the two houses of Parliament is necessary to every determination of Parliament. But it is now understood that the Lords Spiritual and Lords Temporal are but one body, whose joint will is to be collected by the gross majority of voices; and statutes have been made in the absence of all the Spiritual Lords.

The House of Lords has two distinct functions: the legislative and the judicial.

In its legislative character, every new law, and every change in the existing law, must have the consent of a majority of this house, as well as of a majority of the House of Commons.

In its judicial character, it is a court for the trial: 1. Of criminal cases on impeachment by the House of Commons; 2. Of peers on indictments found by a grand jury; 3. For the hearing and determining of appeals from decisions of the Court of Chancery; 4. For the hearing and determining of appeals on writs of error to reverse judgments in the Court of King's Bench; and 5. In hearing and determining appeals from the supreme courts in Ireland and Scotland. The house has the power to require the attendance of the judges to assist it in the discharge of its duties.

A few points in which the House of Lords differs from the lower house of Parliament remain to be noticed. In the chair of the house sits the lord high chancellor of England. When the king (or queen) goes to Parliament he takes the throne in the House of Lords, and the Commons are summoned to attend him there to receive the communication of his will and pleasure. The royal assent to bills, whether given by the king or queen in person, or by a commission appointed by the king or queen, is given in the House of Lords. All bills affecting in any way the rights and dignities of the peerage must originate in that house. The members of the House of Lords have a right of voting on any measure before the house by proxy, the proxy being a member of the house: and, lastly, they have the privilege of entering on the journals of the house their dissent from any measure which has received the sanction of the majority, with the reasons for that dissent. This is called their protest.

LORDSHIP. [Leet.]

LORE'TO, a town of the Papal state in the province of Macerata, near the coast of the Adriatic, 15 miles south by east of Ancona, celebrated for its sanctuary of the Virgin Mary, which is called 'La Santa Casa' (the holy house). It is an oblong quadrilateral building, the walls of which are of brick covered with cement, 40 feet long, about 20 wide, and 25 feet high: it contains only one room, with a door, a chimney, and a window. In a niche there is a statue of the Virgin made of cedar wood. The legend says that this was the dwelling of Mary at Nazareth, where it was often visited by the Christian pilgrims; that in the year 1291, after the Mussulmans took Ptolemais, the last hold of the Christians in Palestine, the house was lifted up and carried away by supernatural power to Dalmatia, where it rested on a hill near the sea-coast, between Tersactum and Fiume, of which district Nicolo Frangipani was the governor. The legend goes on to say that after remaining some time in Dalmatia, and being the object of public wonder and veneration, it was again removed by invisible hands, in December, 1294, and carried across the Adriatic to a hill near Recanati, on ground belonging to a woman of the name of Lauretta, a diminutive of Laura, from which the name of Loreto is derived. Further particulars concerning this tradition are given in the *Teatro Istorico della Santa Casa Nazarena della B Vergine Maria e sua ammirabile traslazione in Loreto*, by Martorelli, bishop of Montefeltro, 2 vols. folio, Rome, 1732, dedicated to Pope Clement XII. This legend has furnished Tasso with the subject of one of his finest lyrics, beginning with 'Ecco frà le tempeste e i fieri venti.' A splendid church was afterwards built round 'the holy house,' and embellished and enriched by successive popes, among others by Leo X., Clement VII., and Sixtus V. The town of Loreto, which is small but well built, and contains 6000 inhabitants, has grown round the sanctuary, which is annually visited by numerous pilgrims. A considerable trade is carried on in beads, rosaries, agni Dei, and other devotional ornaments. Loreto is a bishop's see. The once well-filled treasury of the church of Loreto was in great measure emptied by Pius VI. to enable him to satisfy the demands of the French in 1796. In the following year, when the French took Loreto, they found little to glean. The church and treasury have been again enriched since the Restoration by votive offerings of devotees. (Valéry, *Voyages en Italie.*)

LORENZO DE' MEDICI. [Medici.]

LORICA'RIA. [Cellariæa, vol. vi., p. 405.] The term *Loricaria* is also employed by Linnæus to designate a genus of *Malacopterygious Fishes.*

LORICA'RIA, a subdivision of the Linnæan genus Cellaria, proposed by Lamouroux. [Cellariæa.]

LORICA'TA, the name applied by Merrem and Fitzinger to the *Crocodiles*, *Emydosaurians* of De Blainville. [Crocodile, vol. viii., p. 162.]

LO'RIENT, a town and port of France, at the confluence of the Scorf and the Blavet, in the department of Morbihan, 266 miles west by south of Paris in a direct line, or 288 miles by the road through Alençon, Fougères, Rennes, and Ploërmel.

This town is of modern origin. In A.D. 1666 Louis XIV. granted permission to the French India Company to establish magazines and docks for building vessels on a part of the shore of Port Louis, the name given to the mouth of the Blavet. The establishment thus formed, which continued long in the possession of the company (now dissolved), is at present in the hands of government. From the company's establishment the place took the title of Port L'Orient (Port of the East). In A.D. 1720 the building of the town was commenced: in 1738 the inhabitants amounted to 14,000, in which year the town was incorporated. The India Company had previously established here their annual sale of Chinese and Indian commodities. In 1744 the town was fortified. During the long wars of the Revolution, the commerce and population of the town declined; but since the peace of 1815, commerce has been gradually resuming its former activity.

The town is well laid out, with wide, straight, well-paved, and clean streets: the houses are well built, and there are several pleasant promenades. The bridge over the Scorf, the quays, the theatre, and the covered meat and fish markets are the public buildings most entitled to notice. There is a public 'abattoir,' or slaughter-house. The port is on the east side of the town, from which it is walled off: its length is nearly 4000 feet; its breadth is nearly 2000 feet. The royal dockyard is one of the finest in the kingdom; there were, a few years since, slips for laying down fifteen vessels of war at a time, and the works then carrying on were expected to increase the number to thirty. Among the most remarkable objects connected with the dockyard are the machinery for fixing the masts; the basin for ships under repair; the block-manufactory, worked by steam; the arsenal; the lodgings for military convicts, of whom there are commonly 600; the handsome artillery barracks, capable of accommodating 1800 men; the school of naval artillery, with its library, museums, and drawing-hall; the apartments and gardens of the maritime prefect; and the offices of the various departments of the public service. There is a watch-tower, from which vessels can be discerned 30 miles out at sea.

The population of the commune of Lorient, at the beginning of the present century, was above 22,000; in 1826 it had sunk to little more than 15,000. In 1831 it was 18,322 (of whom 14,396 were in the town); in 1836 it was 18,975. There are some manufactures of hats, linens, braid, and pottery: the trade consists in the export, partly to the colonies, of wax, honey, salt, butter, corn, cattle, and manufactured goods. The sardine fishery is actively carried on. There are three yearly fairs.

About a mile from the arsenal, on the bank of the Scorf, is a powder-magazine; and a mile west, an exercise-ground for the artillery. An hospital has lately been erected on the Island of St. Michel, in the roadstead.

There are in Lorient a subordinate court of justice, custom-house, and stamp and other government-offices; a high school; an establishment for the special instruction of students destined for the navy, or for the great schools of Forestière and St. Cyr and the Polytechnic School; an agricultural society; a society for affording gratuitous instruction in practical geometry and mechanics; a free-school for arithmetic and geometry; a free-school on the monitorial system; and six elementary schools. There are also a well-arranged and well-ventilated prison, and a civil and military hospital, besides that on the Island of St. Michel. The fortifications of this town are in tolerable condition. The environs are exceedingly well cultivated.

Lorient is the capital of an arrondissement, containing an area of 772 square miles: it is subdivided into eleven cantons, or districts, each under a justice of the peace, and 48 communes: the arrondissement had a population, in 1831, of 128,458; in 1836, of 133,307.

LO'RIPES. [Veneridæ.]

LORIS. [Lemuridæ; Nycticebus; Stenops.]

LORN is a district of Argyleshire, bounded on the east and north-east by Loch Linnhe and the Atlantic Ocean; on the south and south-west by Lochs Melfort, Aich, and Awe, and by the district of Argyle; on the west by Perthshire, and on the north by the shire of Inverness, from which it is separated by Loch Leven. It is divided into Upper or Northern Lorn, Nether or Southern Lorn, and Mid Lorn, and lies between 56° 18′ and 56° 42′ N. lat. and between 4° 35′ and 5° 37′ W. long., comprising the 13 parishes of Appin, Andchattan, Dalavich, Glenorchy, Kilbrandon, Kilbride, Kilchattan, Kilchrenen, Kilmelford, Kilmore, Kilninver, Lismore (island), and Muckairn. The above boundary, which differs considerably from that given by several topographers (some of whom make Loch Etive one of the boundaries), is taken from Langland's large map of Argyleshire, published in 1801. The parishes comprised in the district are those enumerated in the Population Returns.

LORRAINE, a province or military government of France before the Revolution, situated on the north-eastern frontier. It was bounded on the north by the duchy of Luxembourg and the electorate of Trèves; on the north-east by the duchy of Deux Ponts, in the Palatinate; on the east by Alsace, from which it was separated by the Vosges; on the south by Franche Comté; on the south-west by the county of Langres in Champagne; and on the west by other districts of Champagne. The length of the province was about 115 miles from north to south; its breadth from east to west 130 miles in the northern and about 70 miles in the southern part. It area was about 6730 square miles. It was watered in the west by some of the feeders of the Aisne and Marne, belonging to the system of the Seine, and by the Meuse; on the east by the Moselle and its tributaries.

Lorraine, in the extended application of the name, corresponding with the bounds and dimensions given above, comprehended the following divisions:—

Larger Divisions.	Subdivisions.	Chief Towns, with population in 1836.
I. The Duchy of Lorraine, containing	1. La Lorraine Propre .	Nanci, 31,445; Lunéville, 12,798.
	2. La Lorraine Allemande, or German Lorraine . . .	Sarreguemines, 4113.
	3. Le Pays des Vosges .	Epinal, 9526; Mirecourt, 5684; Remiremont, 5055; St. Diey, 7906.
II. The Duchy of Bar, or Le Barrois, containing	1. Le Barrois Mouvant	Bar sur Ornain, or Bar le Duc, 12,496 in 1831.
	2. Le Barrois non Mouvant	Briey, 1730.
III. The three Bishoprics, containing	1. Le Pays Messin .	Metz, 42,793.
	2. Le Toulois . . .	Toul, 7333.
	3. Le Verdunois . .	Verdun, 10,577.

A small portion of La Lorraine Allemande was ceded by France to Prussia by the treaty of Vienna, 1815, and has been incorporated in the Rhenish Provinces of that kingdom. The remainder constitutes the departments of Meurthe, Meuse, Moselle, and Vosges.

At the time of the Roman Conquest of Gaul under Cæsar, Lorraine was inhabited by the Treveri, or Treviri, the Mediomatrici, the Verodunenses, and the Leuci, all Belgic tribes, whose country, in the subdivision of the Roman province, or, as it was termed in the later period of the Empire, the diocese of Gaul, formed the province of Belgica Prima. This part of Gaul was comprehended in the earlier conquests of Clovis, to whom all France north of the Loire and the Rhône became subject by the close of the fifth century.

In the division of the Frankish empire under the sons of Clovis, Lorraine formed part of the kingdom of Austrasia. In this kingdom the power of the Franks was greater and the military habits of the people were more firmly retained than in other parts of France. It was in this part of France that the Carlovingian family first rose to power under Pepin l'Heristal and Charles Martel.

In the division of the empire of Charlemagne between the children of his son and successor Louis le Debonnaire, that part of France which lies east of the Meuse, the Saône, and the Rhône, became, with other countries as far as the Rhine, and with Italy and Switzerland, the portion of the emperor Lothaire (A.D. 843). In the partition of this prince's dominions, the northern part, comprising the country between the Rhine and the Meuse, was assigned to his son Lothaire the younger. From one or both of these princes the country took the name of the France of Lothaire, in Low Latin Lotharingia, whence the German name Lothringen, and the French Lothierregne and Lorraine. This kingdom existed for a long period, and was united with the imperial crown, so that eastern France became a portion of the empire.

The duchy of Lorraine consisted of a large part of the kingdom of Lorraine. It was established in the tenth century, and was afterwards divided into two parts, Lower Lorraine or Brabant, and Upper Lorraine, which has retained its designation to modern times. The duchy of Upper Lorraine was in the eleventh century conferred by the emperor on Gérard, a noble of Alsace. From this Gérard descended the long line of the dukes of Lorraine who governed the country till towards the middle of the last century. The reigns of Gérard's successors were chiefly occupied with civil dissensions, in which they were engaged with their subject nobility and ecclesiastics. Simon II., who was duke from A.D. 1176 to A.D. 1205, distinguished himself by the repression of internal disorders, and by the protection of the churches and of the poor from the aggressions of the rich. He expelled the Jews from his dominions. He abdicated his duchy to retire to a cloister, where he died shortly after, A.D. 1207. The county, afterwards duchy of Bar, was separated from the duchy of Lorraine in the eleventh century. In the following centuries the dukes were continually engaged in hostilities, either as vassals of the emperors of Germany (who were possessors of the antient kingdom of Lorraine), or on their own account with other potentates, or with the more powerful of their own vassals, especially the bishops of Metz. The connexion of the dukes with France, under the crown of which they held some fiefs, involved them also in the disputes, foreign and domestic, of that kingdom. Raoul, duke of Lorraine, was one of those who fell in the battle of Creci, A.D. 1346, fighting with Philippe of Valois against the English; and Jéan, his son and successor, a mere boy, was taken prisoner after distinguishing himself by his valour at the battle of Poitiers, A.D. 1346. He was again taken prisoner, A.D. 1364, at the battle of Auray in Bretagne, in which Charles de Blois was defeated and slain by Jéan de Montfort, his rival claimant for that duchy. [Bretagne.] The duke Jéan of Lorraine was also present at the battle of Rosbecque, in which Charles VI. of France defeated the Flemings (A.D. 1382): he died A.D. 1390.

On the death of Charles le Hardi, the successor of Jéan in the duchy of Lorraine, the succession was disputed by René I., duke of Bar and of Anjou, and Antoine de Vaudemont, nephew of Charles. In the war that ensued René was defeated and taken prisoner (A.D. 1431) by his rival, who was supported by the duke of Bourgogne, while René had the assistance of Charles VII. of France. René ultimately obtained his liberty (A.D. 1436), and set out for Naples, the crown of which had fallen to him during his captivity. Lorraine had been confirmed to him by the decision both of the emperor Sigismund and of the council of Bâle. The life of René was busy. In A.D. 1453, long before his death, he resigned the duchy of Lorraine to his eldest son Jéan, duke of Calabria, who joined in the 'Ligue du Bien Public' against Louis XI. of France (A.D. 1464), and died (A.D. 1470) at Barcelona in an attempt to vindicate his claim to the crown of Aragon. He was succeeded by his son Nicholas, on whose death (A.D. 1473) Lorraine came to René II., grandson, on his mother's side, of René I., and on his father's side, of Antoine, duke of Bar, who had been René's competitor. René II. was seized by Charles le Téméraire, duke of Bourgogne [Bourgogne], together with his mother Yolande, almost immediately on his (René's) accession to the duchy, and though released by the interference of Louis XI., was obliged to make an alliance, offensive and defensive, with Charles. Charles soon afterwards again attacked Lorraine, took the capital (Nanci) and other towns, and obtained possession of the whole duchy. The defeat of Charles by the Swiss at Granson (March, 1476) revived the hopes of René. He assisted the Swiss with a body of troops in their second victory over Charles at Morat, in June in the same year; and returning to Lorraine, rapidly reconquered it. Nanci surrendered to him in October; and upon Charles leading an army in the ensuing winter, to recapture the town, he was defeated and slain by René (January, 1477). René subsequently distinguished himself in the wars of Italy; and obtained of Charles VIII. of France the restoration of the duchy of Bar, which had been seized by Louis XI. René died A.D. 1508.

Antoine, the successor of René II. (A.D. 1508), seems to have merited, by his care to promote the happiness of his subjects, the title which he received of '*the Good*.' His reign is chiefly remarkable for his struggle against the peasants of Alsace, whom the excitement of the Reformation induced to rise in vindication of their liberty, but who failed in their attempt; and for the declaration of Lorraine as a free and independent sovereignty by the Germanic body. In the wars of the emperor Charles V. with François I. of France, Antoine preserved a wise neutrality. He died A.D. 1544, and was succeeded by his son François I. The duchy of Lorraine, which thus took rank among the sovereign states of Europe, was not co-extensive with the French province of Lorraine, of which it subsequently constituted only a subdivision, as noticed in the preceding geographical sketch.

François I. reigned only a year. He was succeeded by his son Charles II. (or III.), who during the long period in which he held the duchy (A.D. 1545-1608) did much for its improvement: he acquired regal rights over that part of the duchy of Bar which he held as vassal of the king of France, reserving only the homage due to the latter and the right of appeal. Duke Charles founded a university at Pont à Mousson. He supported the party of the League in France, at the head of which were his kinsmen the princes of the house of Guise. [Guise.]

Henri II., François II., and Charles III. (or IV.) successively occupied the ducal throne. Charles III. (or IV.) was involved in hostilities with Louis XIII. of France, by whom the duchy was in great part conquered. Duke Charles distinguished himself in the thirty years' war in Germany, and was one of the commanders in the army of the Catholic League at the battle of Nordlingen, A.D. 1634. The treaty of the Pyrenees restored Lorraine to him; and subsequent negotiations (A.D. 1661) with cardinal Mazarin secured also the restitution of the duchy of Bar. The other districts which subsequently made up the province of Lorraine were then in the hands of the French king; and Charles agreed that on his death the whole of his states should fall to the crown of France. But the duke, suspicious of the designs or apprehensive of the power of France, renounced his independent sovereignty, and renewed his allegiance to the emperor. And when, in A.D. 1670, Louis XIV. seized his dominions, an imperial ambassador was sent to Paris to claim exemption from hostilities for them as part of the empire. After two or three years spent in negotiations, hostilities became general on the Continent, and Duke Charles distinguished himself in the imperial service on several occasions, till his death, A.D. 1675. His restless, unquiet, and versatile character had involved him in continual difficulties. He was succeeded by his nephew Charles IV. (or V.), also a distinguished military commander. Finding himself (A.D. 1677) at the head of an army of 60,000 imperialists, he attempted to regain possession of Lorraine, but was baffled by the skill of the French Maréchal Crequi, who had only 30,000 men. At the treaty of Nimeguen, A.D. 1678, the restitution of Lorraine was offered to him, but on conditions which he refused to accept. He distinguished himself afterwards at the head of the imperialists in Hungary against the Turks, and aided Sobieski in the deliverance of Vienna (A.D. 1683). He died A.D. 1690.

Leopold, the successor of Charles, obtained restitution of his states by the treaty of Ryswick, A.D. 1697. He observed neutrality in the war of the Spanish succession, and devoted himself to the improvement of his dominions. He died A.D. 1729, and was succeeded by his eldest son François Etienne, who in 1735 acquiesced in a treaty between France and the empire, by which his duchy was ceded to Stanislaus Leckzinski, ex-king of Poland, whose daughter had been married to Louis XV. of France. It was further agreed that on the death of Stanislaus the duchy should be united to France. François Etienne, who married, the following year, the archduchess Maria Theresa, and was afterwards (A.D. 1745) elected to the imperial crown, received the reversion of Tuscany in exchange for Lorraine. Stanislaus was recognised as duke of Lorraine and Bar, A.D. 1737. He governed the country with wisdom and beneficence, encouraged agriculture and trade, managed his finances with economy, and founded, for the cultivation of science, the Académie of Nanci, of which he became a member. His robe de chambre having accidentally taken fire, he was so severely burned that he died eighteen days after, on the 23rd February, 1766, aged eighty-nine. On his death Lorraine was incorporated with France, to which it has ever since remained attached.

LORRAINE, CARDINAL DE. [GUISE.]

LORY. [PSITTACIDÆ.]

LÖSS, a peculiar loamy deposit in the valley of the Rhine, and extending to some breadth beyond that area, which may be conjectured to be analogous with accumulations in valleys of South America containing the megatherium, and with other 'valley formations' in different parts of the world. It borders the valley plain of the Rhine, reaching, though not continuously, from Schaffhausen to Cologne, enters many of the lateral dales, lies against the hills, and constitutes hills itself. In the line between Basle and Bingen it occupies the left bank by Worms, Oppenheim, Flonheim, &c., and the right bank by the Schwarzwald to Basle. Compared to the usual character of diluvium, the Löss is a fine-grained deposit; fine sand, clay, and calcareous earth, easily pulverized, and containing some nodular concretions, constitute the mass of the deposit. It sometimes (at Heidelberg) alternates with gravel.

Principally in the upper parts of the Löss are found shells of land, fresh-water, and marsh mollusca now living in the vicinity. These sometimes retain their colour. Bones and teeth of quadrupeds usually met with in diluvium occur locally in Löss, as at Weinheim and Bensheim. These bones appear sometimes to have been drifted to their present repositories, as at Rixheim, where upon and in cavities in the fresh-water tertiaries bones of stag, rhinoceros, hyæna, elephant, horse, &c. occurred. Cannstadt yielded bones and teeth of elephant, rhinoceros, tiger, hyæna, wolf, bear, stag, roebuck, oxen, horses, boar, mouse, hare, birds, and remains of vegetables. (Meyer, *Palæologica.*)

Between Strasburg and Sulzbad the Löss reaches 600 French feet above the sea, and on the Kaiserstuhl 1200 feet, an elevation supposed to be explained by the volcanic character of the vicinity. The thickness of the Löss is stated to reach 200 or even 300 feet. Near Andernach, Löss alternates with volcanic sediments ('Trass'), but generally overlies them, and in places fills old craters (as the Roderberg, near Bonn).

The deposition of Löss in the upper Rheinthal has been often viewed as the effect of a lake supposed to have extended from Basle to Mayence, and to have been drained by the opening of the narrow gorge at Bingen; but from the continuation of this deposit below that gorge, the elevation it has attained on the flanks of the Siebengebirge, and other circumstances, Mr. Lyell, who has specially examined the subject, proposes a different hypothesis. He thinks that the whole country drained by the Rhine has undergone changes of level, such that after having formerly stood for some unknown period with nearly its actual height and physical features, it experienced a great and general depression, so as to receive river deposits in great abundance; and that it was again raised, so as to permit the partial re-excavation of the antient valleys, and the removal of much of the fluviatile sediments: what remains is the Löss.

(Meyer, *Palæologica;* Lyell, in *Edinb. Phil. Journal*, 1834; and *Principles of Geology*, last edition, vol. iv.)

LOSTWITHIEL. [CORNWALL.]

LOT, a river in France, belonging to the system of the Garonne. [FRANCE; GARONNE.] It rises on the north-western slope of the Cévennes, not far from Mount Lozère. Its general direction is west, past Mende, Espalion, Cahors, and Villeneuve d'Agen, into the Garonne, which it joins a few miles below Agen. Its length is about 220 miles; for 70 of which, viz. from Entraygues, a few miles below Espalion, it is navigable; but the navigation is difficult and dangerous, especially above Cahors, from the rocks which obstruct the current. Below Cahors the navigation is facilitated by several sluices.

The river is supposed to have been known to the Romans by the name of Oltis, which leads us to Olt as the old vernacular term, a name which also belongs to a small river of Lancashire and to a branch of the Danube. A town on the bank is still called St. Geniès de Rivedolt, or Rive d'Olt, and another is called St. Vincent de Rivedot (Rive d'Old). From the incorporation of the article (L'Olt), the modern name Lot has resulted.

LOT, a department of France traversed by the Lot, is bounded on the north by the department of Corrèze; on the north-east by that of Cantal; on the south-east by that of Aveyron; on the south by that of Tarn et Garonne; on the south-west by that of Lot et Garonne; and on the north-west by that of Dordogne. Its greatest length is from the neighbourhood of the town of Moncuq in the south-west to the bank of the Cère in the north-east, 68 miles; its greatest breadth, at right angles to the length, is from between the towns of Martel and L'Arche (Corrèze) to the neighbourhood of Figeac, 52 miles. The area is estimated at 2034 square miles, being about equal to that of the English county of Norfolk. The population in 1831 was 283,827; in 1836, 287,003, showing an increase in five years of 3176, or rather more than 1 per cent., and giving about 141 inhabitants to a square mile; considerably below the average density of population in France, and very far below that of the English county with which we have compared it. Cahors, the capital, is in 44° 26′ N. lat. and 1° 27′ E. long., 307 miles in a direct line south by west of Paris, or 370 miles by the road through Orléans, Châteauroux, and Limoges.

The department has no very lofty elevations; but hills of moderate height occupy a considerable part of its surface. The principal range is a branch from the central group of Auvergne: it enters the department on the eastern side, and extends through it westward into the adjacent department of Dordogne, separating the basin of the Dordogne from that of the Lot. The south-western part of the department, in the neighbourhood of Cahors, is occupied by the chalk formation; the southern and central parts by the strata which intervene between the chalk and the new red or saliferous sandstone; the eastern side by the formations from the saliferous sandstone (inclusive) to those which repose on the primitive rocks; and the north-eastern part of the department along the bank of the Cère by the primitive rocks. Among the mineral productions are coal and iron; but the whole quantity of coal produced in 1835 was only 60 tons: the iron-works are also unimportant. The hills afford granite, marble of various colours, alabaster, calcareous spar, and stone for millstones and lithography. Crucible-clay and fullers' earth are found in the valleys. There are several mineral springs. There are one or two remarkable caverns in the department; one near the bank of the Selle contains the fossil bones of animals not now found in Europe.

The northern side of the department is watered by the Dordogne, which first skirts the border for two or three miles, separating the department from that of Corrèze, and then flows through the department in a winding channel past the town of Souillac: after again skirting the border for two or three miles, it enters the department of Dordogne. The navigation commences at Mayronne. The southern part of the department is watered by the Lot, which, after dividing it for several miles from the department of Aveyron, crosses it in a very sinuous course from east to west into the department of Lot et Garonne. It is navigable throughout.

The navigation of the Dordogne in this department may be estimated at about fifteen miles; that of the Lot at about eighty-six. There are no canals.

The number of Routes Royales, or government roads, is only four: their aggregate length (Jan. 1, 1837) was 170 miles, of which 115 were in repair, 13 out of repair, and 42 unfinished. The principal roads are those from Paris by Orléans and Limoges to Cahors, and from Cahors to Montauban and Toulouse. These two roads form one line, which crosses the department from north to south. Other roads lead from Cahors eastward to Villefranche and Rodez (Aveyron), and westward along the banks of the Lot and the Garonne to Bordeaux (Gironde). The Routes Départementales were nineteen in number, with an aggregate length of nearly 400 miles, but not half of them were finished. The bye-roads and paths amount to between five and six thousand, with an aggregate of nearly 16,000 miles.

The soil of the department is chiefly calcareous, and nearly half of it is under the plough. More corn is raised than is required for home consumption; and fruit, hemp, tobacco, and saffron are grown. The vineyards occupy about a ninth part of the department: the export of wine is large, and the wines are in good repute, especially those of Cahors and Le Grand Constant. The white mulberry-tree is cultivated in almost all places, in order to the rearing of silkworms, which is much attended to. The woodlands are also extensive, occupying about one-sixth part of the department. The number of sheep reared is great, wool being an important object of attention to the farmer. Poultry, game, and truffles are abundant.

The department is divided into three arrondissements, as follows:—

Arrondissement.	Situation.	Area in Sq. Miles.	Population in 1831.	Population in 1836.	Communes.
Cahors,	S.	860	116,336	117,299	122
Figeac	N.E.	616	87,727	89,778	112
Gourdon	N.W.	558	79,764	79,926	66
		2034	283,827	287,003	300

There are twenty-nine cantons, or districts, each under a justice of the peace.

In the arrondissement of Cahors are Cahors (population in 1831, 10,818 town, 12,050 whole commune; in 1836, 12,417 commune) [CAHORS]; St. Cirq, Vers, La Roque-des-Arcs, Luzech, St. Vincent-de-Rivedot, Castlefranc, Belleye, Prayssac, Crezels, Puy-l'Evêque, and Duravel, on or near the Lot; Cabreres or Cabrerets, on the Celle, a feeder of the Lot; Concots, Beauregard, Lalbenque, Castelnau-de-Montratier (pop. 4053), and Moncuq, in the country south of the Lot; and Catus, St. Médard, Lherin, or Lherm, Les Arques, Cazals, Marmignac, Montelera, and Fressinet, or Fraissinet, in that part of the arrondissement which lies north of that river. Cabreres or Cabrerets is remarkable for a grotto with beautiful stalactites. Castlenau-de-Montratier is on a hill, the base of which is washed by the Latte or Lute, one of the streams flowing into the Garonne. It has some manufactures of coarse woollens for the clothing of the peasantry of the neighbourhood. The church was, before the Revolution, a collegiate church.

In the arrondissement of Figeac are Figeac and Marcillac, on the Celle; Bouillac, Capdenac or Cadenac, and Cajare, on the Lot; Cardaillac and Fons, on two small streams which unite and flow into the Celle; Brétonoux on the Cère, a feeder of the Dordogne; St. Céré on the Bave, that flows into the Cère; and Loubressac, Sousceyrac, and L'Hôpital. Figeac, capital of the arrondissement, owes its origin to a wealthy Benedictine abbey, founded in A.D. 755 by king Pepin le Bref, and afterwards secularized. Figeac was besieged A.D. 1568 by a powerful army of Huguenots; but the assailants, after three months, were obliged to raise the siege. They afterwards took the town by surprise, A.D. 1576, pillaged it, and put many of the Catholics to the sword. They erected a citadel, which was given up in A.D. 1622 to Louis XIII., who demolished it, as well as the fortifications of the city. There are two fine Gothic churches at Figeac. The population in 1831 was 4691 for the town, or 6390 for the whole commune; in 1836 it was 6237 for the commune. Some cotton manufactures are carried on, and there is considerable trade in wine and cattle. Coal is obtained in the neighbourhood, and there is a quarry of excellent freestone. Marcillac had formerly an abbey, the foundation of which was ascribed to Pepin le Bref. There is near the town a remarkable grotto, comprehending several apartments, with stalactites and stalagmites having the forms of columns and statues. Near Cajare are some caverns, denominated 'the Caverns of Waiffre,' from the circumstance of the adherents of Waiffre, duke of Aquitaine, having sought safety in these caverns, where they were discovered and massacred by the soldiers of Pepin le Bref. St. Céré (pop. 2905 town, 3987 whole commune) had, before the Revolution, two religious houses. Hempen cloth is manufactured here, and considerable trade is carried on in raw hemp and hempen thread. Good marble is quarried near the town. At the village of Assier, not far from the Celle, are the remains of a fine castle, built in the time of François I. by Galiot de Genouillac, one of his officers. There is also a church, the architecture of which is remarkable for its lightness.

In the arrondissement of Gourdon are Gourdon and Le Vigan, on the Bloue or Bleu, a small stream which flows into the Ceou, a feeder of the Dordogne; Carennac and Souillac, on the Dordogne; Martel in the country north of that river; Gramat and Rocamadour, on the Alzou, which flows into the Dordogne; Montfaucon, on the Ceou, a feeder of the Dordogne; Degagnac and Lavercantière. Gourdon is on a rising ground: the population in 1831 was 2813 for the town, or 5153 for the whole commune. In 1836 it was 5334 for the commune. There are some manufactures of woollen stuffs and sail-cloth. Coarse-grained granite is quarried in the neighbourhood. Souillac (pop. 2253 town, 3096 whole commune) has a parish church, formerly belonging to an antient Benedictine abbey, and a fine bridge of seven arches over the Dordogne, which is here navigable. There is a royal manufactory of fire-arms; coarse woollens and hats are manufactured; and trade is carried on in wine, leather, salt, and timber. There are near the town two remarkable intermitting springs, called Le Gourg and Le Bouley. Limestone and building-stone are quarried near Martel (pop. 1824 town, 2903 whole commune) and Gramat (pop. 1545 town, 3428 whole commune). Rocamadour had formerly a monastery, the church of which still exists; it was an object of resort to pilgrims, on account of the burial there of St. Amadour, whom some legendary fables confounded with Zaccheus the publican, mentioned in the gospel of St. Luke. Henry II. of England made a pilgrimage to this place: his son Henry was on his way to pillage the church when he died. A sword chained to the walls of this church is affirmed to be that of the chivalrous Roland. There is another church or chapel at Rocamadour cut out in the rock.

The chief manufactures of the department are woollen stuffs of various kinds, linens, and some silks. The chief trade in agricultural produce is corn, flour, wine, and walnut oil and hemp. These goods are sent to Cahors to be sent down the Lot, or to Souillac for embarkation on the Dordogne.

The department constitutes the diocese of Cahors, the bishop of which is a suffragan of the archbishop of Albi. It is in the jurisdiction of the Cour Royale of Agen, in the circuit of the Académie Universitaire of Cahors, and in the eleventh military division, the head-quarters of which are at Bordeaux. It sends five members to the Chamber of Deputies. In respect of education this department is far below the average of France. Of the young men enrolled in the military census of 1828-29, only twenty-four in a hundred could read and write, the average of France being thirty-nine.

In the time of Cæsar this department was part of the territory of the Cadurci, from whom its capital Cahors, originally Divona, derived its name. Uxellodunum, the last place in Gaul which held out against Cæsar, was probably a hill called Puech d'Issolu, on the bank of the Tourmente, a small feeder of the Dordogne in this department. Another town, Varadetum, mentioned in the Peutinger Table, was probably at or near Varaie, a village south of the Lot. Before the Revolution the country included in this department constituted the greater part of Querci or Quercy, a province of Guienne.

LOT ET GARONNE, a department of France, bounded on the north by that of Dordogne; on the north-east by that of Lot; on the south-east by that of Tarn et Garonne; on the south by that of Gers; on the south-west by that of Landes; and on the west and north-west by that of Gironde. Its greatest length is from north-east, near the little town of Sauveterre, to south-west on the border of the department of Landes, between Castel Jaloux (Lot et Garonne) and Roquefort (Landes) 66 miles; the greatest breadth, at right angles to the length, is from near the little town of Duras north west to the neighbourhood of Puymirol south-east, 54 miles. The area is estimated at 2057 square miles, rather less than the average area of the French departments, but rather more than that of the English county of Norfolk. The population in 1831 was 346,885; in 1836 it was 346,400, showing a decrease in five years of 485, and giving 168 inhabitants to a square mile; rather more than the average density of population in France, but not equal to the density of the population of the English county with which we have compared it. Agen, the capital, is on the Garonne, in 44° 12′ N. lat., 0° 36′ E. long., about 330 miles in a direct line south by west of Paris, or 369 miles by the road through Orléans, Limoges, and Perigueux.

The department has no elevations deserving the name of mountains: the hills which divide the valley of the Dordogne from that of the Lot occupy a small portion on the north-east; and the range of high land which, branching from the Pyrenees, divides the basin of the Adour from that of the Garonne, overspreads a small portion on the south-west. The surface of the department is generally undulating, and slopes gently towards the west. The department is wholly occupied by the strata above the chalk. Some iron is procured; and there are marl-pits and gypsum-quarries. Peat and potters' earth are also procured; the first in small quantity, the second abundantly.

The principal rivers are the Garonne, and its tributaries the Lot and the Baise. The Garonne enters the department from that of Tarn et Garonne on the south-east side, and runs west-north-west 27 miles to a little above the junction of the Baise, receiving the Saône on its left and the Gers on the right bank: it then runs 15 miles north by west to below Tonneins, receiving the Baise on the left and the Lot on the right bank: from below Tonneins it flows about 20 miles north-west into the department of Gironde. The length of that part of the river which is in this department may be estimated at 62 miles: the official returns make it 65. The Baise enters the department from that of Gers on the south side; and flows 17 miles north by west by Nérac (where it becomes navigable) to Lavardec; from thence it flows north-east and north 7 miles into the Garonne: its whole course in the department is 24 miles, for about half of which it is navigable. The Lot enters this department from that of Lot, on the eastern side: and flows in a winding course south-west 12 miles to the little town of Penne, where it receives the Bondusson on the left bank; from thence it flows west by north 12 miles to Chasseneuil; and from Chasseneuil 20 miles south-west to its junction with the Lot: its whole course in this department is about 44 miles (the official returns give 51), for the whole of which it is navigable. The Dropt, a tributary of the Garonne, waters the northern part of the department, in which it is navigable for about 16 miles; it unites with the Garonne in the adjacent department of Gironde. The total inland navigation of this department amounts, according to the official returns, to about 150 miles. There are no canals.

There were in 1837 six government roads, with an aggregate length of 223 miles, of which 38 miles were unfinished. The road from Paris by Limoges and Perigueux enters the department on the north and runs southward by Castillonnes, Villeneuve d'Agen, Agen and Astafort to Auch, in the department of Gers. Roads branch off from this at Villeneuve d'Agen by Libos and Fumel, along the bank of the Lot to Cahors (Lot); and from Agen by La Plume and La Monjoye to Condom (Gers). A road from Bordeaux to Toulouse by the bank of the Garonne passes through Bazeille, Marmande, Tonneins, Clairac, Aiguillon (where a road from Villeneuve d'Agen by Temple and La Fate falls into it), Port-Sainte-Marie, Clermont, and Agen (where it intersects the great road from Paris to Auch), into the department of Tarn et Garonne. A branch from this road at Port-Sainte-Marie leads by Lavardec and Nérac along the banks of the Baise to Auch.

The departmental roads were sixteen in number, having an aggregate length of above 270 miles, of which about 55 miles were out of repair, and nearly 100 miles unfinished. The bye-roads and pathways amounted to above nine thousand, with an aggregate length of nearly 8000 miles.

The valleys watered by the Lot and the Garonne are among the richest portions of the soil of France: but the western side of the department is occupied by those dreary wastes, or 'landes,' which overspread so large a portion of this part of France [GIRONDE; LANDES]: they constitute about an eighth of the department. These districts, covered with dry and shifting sand, produce only a little rye or panic, and that by the aid of manure; they are covered in some places by pools and marshes; in other parts by forests of pines or cork-trees, which constitute an important part of the wealth of the department. The northern parts of the department are occupied by a ferruginous clay which yields but a poor return to the cultivator; and the hills between the Garonne and the Lot in the eastern part are little better. These comparatively unproductive soils extend over two-thirds of the department. The valleys of the Lot and Garonne compensate by their fertility for these barren tracts: they produce abundance of wheat, rye, barley, oats, and maize; so that the growth of corn in the department exceeds the consumption. Above half the soil is under the plough. Fruit-trees are numerous, especially plum-trees, which yield excellent prunes for exportation. The vineyards are extensive, and the produce is double the consumption. The wine is high-coloured and rich, well calculated for keeping and for bearing a sea voyage; but in other respects not of the best quality, except the red wines of Thésac, La Rocal, Buzet, and Péricard; and the white wines of Clairac and Aiguillon. Tobacco is cultivated on a large scale, and is the best grown in France; and hemp is of remarkably fine growth and excellent quality. The woods, consisting chiefly of pines, cork-trees, and chesnut-trees, occupy about an eighth of the department. There is a considerable quantity of meadow-land, and the heaths and open pastures are tolerably extensive: the breed of oxen is good; and there are large flocks of sheep. Mules and asses are numerous, but horses are not so. Pigs have much increased of late years. Poultry also has been reared in increasing quantity, especially geese and turkeys, of which a great number are sent to other parts of France. Bees are numerous, also game and fish. The Garonne yields the salmon, the trout, and the lamprey, and even some sturgeons. There are wolves, foxes, rats, and moles.

The climate is considered to be one of the finest in France. There are however alternate periods of rain and clear weather of such length as frequently to injure the harvests. The winds are high, especially the north-west wind, which in summer frequently causes violent tempests. In the spring frequent fogs, accompanied with a light hoar frost, and followed by bright and intense sunshine, are very injurious to vegetation. The marshy exhalations of the landes give rise to dangerous bilious and intermittent fevers.

The department is divided into four arrondissements, as follows:—

Name.	Situation.	Area in sq. miles.	Population in 1831.	Population in 1836.	Communes.
Agen	S.E.	390	84,569	84,368	87
Marmande . .	N.W.	547	104,068	104.172	103
Nérac	S.W.	524	60,661	60,879	78
Villeneuve d'Agen	N.E.	596	97,587	96,961	86
		2,057	346,885	346,400	354

The number of cantons, or districts, each under a justice of the peace, is thirty-five.

In the arrondissement of Agen are Agen, Aiguillon, Port-Sainte-Marie, and Clermont, on the Garonne; Granges on the Lot; Puymirol on and Saint Maurin near the Séoune; Beauville and La Sauvetat de Savères on the Séoune, a feeder of that river; Astaffort and Layrac on the Gers; La Roque-Timbaut, Castelculier, and Prayssas in the country north of the Garonne; and La Plume, Moirax, Caudecoste, and Cuq, in the country south of the Garonne.

Agen is on the right bank of the Garonne. It is mentioned by Ptolemy, who makes it the capital of the Nitiobriges, a Celtic tribe: it is mentioned also in the Itinerary of Antoninus, in Ausonius, in the Notitia Imperii, and in the Peutinger Table: its Latin name was Aginnum or Agennum. Few towns suffered more severely in the irruptions of the barbarous tribes that overthrew the Roman Empire, or in the troubled ages which followed. It was pillaged by Goths, Vandals, Alans, Suevi, and Burgundians; and at a later time by Saracens and Northmen. It was afterwards at different periods subject to the dukes of Aquitaine, the kings of France and England, and the counts of Toulouse; and in the religious wars of the sixteenth century it suffered again. The environs of the town are pleasant, but the town itself is ill built; the squares or open spaces are irregular, the streets narrow, crooked, and dirty; the houses are neither handsome nor convenient. The bridge over the Garonne is tolerably handsome; and the public walks, especially the 'Cours' on the banks of the Garonne, delightful.

The public buildings most worthy of notice are the Church of St. Caprais, the Prefect's Office, and the Hospital of St. Jacques. The population in 1831 was 11,931 for the town, or 12,631 for the whole commune; in 1836 it was 12,309 for the commune. The manufactures are leather, serge, printed cottons and other cotton goods, sailcloth, iron goods, starch, and candles: trade is carried on in these articles, and in corn, flour, wine, and fruit, which are sent to Bordeaux. There are four yearly fairs. There are a public library of 11,000 to 12,000 volumes, a museum, a high-school, a society of arts, sciences, and agriculture; a departmental nursery, a theatre, and baths. Among the eminent natives of Agen are Sulpicius Severus, one of the Christian fathers, Joseph Scaliger, and Lacépède.

Agen is the seat of an antient bishopric; the diocese now comprehends the department: the bishop is a suffragan of the archbishop of Bordeaux. The city is also the seat of a Cour Royale, which has jurisdiction over the departments of Gers, Lot, and Lot et Garonne.

Aiguillon (pop. 2063 town, 4030 whole commune) is in a very fertile valley at the confluence of the Lot and the Garonne. A noble château was commenced here in 1740 by the Duke of Aiguillon and never finished. There are also (or were within the present century) the ruins of an antient castle, once of considerable strength. The inhabitants manufacture stockings, and trade in the produce of the neighbourhood. Port-Sainte-Marie (pop. 1976 town, 3079 whole commune) and Clermont are on the road between Aiguillon and Agen, very near each other.

In the arrondissement of Marmande are Marmande, Meilhan, St. Bazeille, Caumont, Le Mas d'Agenois, and Tonneins on the Garonne; Cocumont and Bouglon in the country south-west of that river; Castel-Moron, La Parade, La Fitte, and Clairac, on the Lot; Bouvelot, Allemans, Pardaillan, and Duras, on or near the Dropt; Soumensac, in the district north of that river, and Miramont, Levignac, Lauzun, Seiches, and St. Barthelemi, Puymiclan, Escassefort, Castelnau-sur-Gupie, Gontaut, and Verteuil, in the country between the Dropt, the Lot, and the Garonne. Marmande is an antient town which was pillaged by the Saracens. It is in a plain on the right bank of the Garonne, lovely rather than picturesque. Though an old town, it is tolerably well built. It has a handsome fountain and a high-school, the buildings of which are worthy of observation. The population in 1831 was 5761 for the town, or 7345 for the whole commune; in 1836 it was 7527 for the commune. The inhabitants manufacture coarse linens, bed-ticking, cordage, leather, and hats; and trade with Bordeaux in corn, wine, brandy, plums, and hemp. There are a public library and an agricultural society. Tonneins consists almost entirely of a long and broad street, lined with good and even elegant houses. The town-hall is in the centre of the town, in a handsome place or square, planted with elms, and commanding a view of the river. The inhabitants (5744 town, 5494 whole commune), nearly half of whom are Protestants, manufacture pins, rope, and hempen thread or yarn. Near the town is a snuff manufactory. Considerable trade is carried on. Clairac (pop. 2407 town, 4943 whole commune) was the first town in France which embraced the Reformed religion; it was formerly the rival of Tonneins in trade: its snuff was the most esteemed of any in France.

In the arrondissement of Nérac are Nérac, Moncrabeau, Lavardac, and Viane, or Viannes, on the Baise; Bruch, Francescas, Montagnac, Moncaut, and La Montjoye, in the country east of the Baise; Sos and Mezin on the Gélize; Castel-Jaloux, Villefranche, Damazan, Saintrailles or Xaintrailles, Lausseignan, and Durance, in the country west of the Baise and Gélize. Nérac consists of two parts, Great and Little Nérac, divided from each other by the Baise, over which is a handsome stone bridge. In Great Nérac is a fine Gothic castle, built by the English, which was for a long time one of the residences of the kings of Navarre. Henri IV. held his court there. In the religious wars of the reign of Louis XIII. it was taken by the duke of Rohan, the Protestant leader, who expelled the magistrates and the partisans of the royalist party; but the town was reoccupied the same night by the royalists, under the duke of Mayenne. Great and Little Nérac are both walled. The market-houses are very large. The population in 1831 was 3560 town, or 6327 for the whole commune; in 1836 it was 6603 for the commune. Among the manufactures of the town are hosiery, leather and starch; there are several corn-mills; the flour is exported or made up into sea-biscuit, or into pastes, highly esteemed by epicures. Mezin (pop. 1802 town, 3146 whole commune) has many water-mills in or about the town. Cork-cutting and tanning are carried on, and there is manufacture of coarse earthenware in the neighbourhood. Castel-Jaloux was one of the places which took part with the Huguenots in their struggle against Louis XIII., but was obliged to submit. Paper, leather, and coarse woollens are manufactured; and considerable trade is carried on in cattle, wine, honey, and paper.

In the arrondissement of Villeneuve d'Agen are Villeneuve d'Agen, Fumel, Libos, Penne, Casseneuil, Sainte-Livrade (pop. 3143), and Le Temple on the Lot; Tournon (pop. 7901) on the Boudousson; Frespech, Pujols, Dolmayrac, and Montpezac or Montpezat, in the country south of the Lot; Sauveterre, Paulhiac, Monflanquin (pop. 5201), La Ledat, Castelnau-de-Combes, Cancon, Montau, or Montaut le Jeune, and Monclar, between the Lot and the Dropt; and Villeréal, Castillonnès, and Cahuzac on the Dropt. Villeneuve d'Agen, or Villeneuve-sur-Lot, has an antient castle, and some remains of the antient town-walls, which have in most parts been replaced by handsome walks. The town, which was built in the thirteenth century, is well laid out. There is an old bridge over the Lot; the principal arch has about 115 feet span, and is 58 high. The population in 1831 was 5934 town, or 10,552 whole commune; in 1836 it was 11,222 for the commune: the inhabitants are engaged in tanning, and carry on trade in corn, wine, plums, cattle, and linen. There are paper-mills and iron-works near the town. There are two yearly fairs. There are a high-school and an agricultural society. Fumel has some paper-mills; and at Penne (pop. 6605) some manufactures of leather and other articles are carried on.

The population of the above places, when not otherwise specified, is that of the whole commune, from the census of 1831.

The chief branches of manufacture are corks, sailcloth, light woollens, quilts and other cotton goods, snuff, earthenware, and gloves. There are also glass-houses, tan-yards, paper-mills, and iron-works. The number of iron furnaces for producing pig-iron is five; charcoal is the principal fuel used: there are twelve forges for the preparation of wrought-iron. The chief trade of the department is in wine, brandy, flour, prunes, hemp, deals, resin and pitch. These articles are sent chiefly to Bordeaux or Toulouse, the conveyance to these towns being facilitated by the navigation of the Garonne.

The department constitutes the diocese of Agen, and is in the jurisdiction of the Cour Royale of that city, and of the Académie Universitaire of Cahors. There are five Protestant consistories in the department, viz. at Clairac, Tonneins, Nérac, Lafitte, and Castelmoron. The department is in the eleventh military division, the head-quarters of which are Bordeaux. It returns five members to the Chamber of Deputies.

The department for the most part formed part of the territory of the Nitiobriges, but it includes probably small portions of the country of the Petrocorii and Vasates. Aginnum (Agen) and Excisum (on the site of Villeneuve d'Agen) were towns of the Nitiobriges. In the Roman division of Gaul, the department was comprehended in Novempopulana, a subdivision of Aquitania. It was afterwards successively under the Visigoths and the Franks; and was exposed to the ravages of the Gascons or Vascons, the Saracens, and the Northmen or Normans. It suffered also in the crusade against the Albigenses; and was ceded to the English by the treaty of Bretigny. It was one of the districts which early received the doctrines of the Reformation. Before the Revolution it constituted part of Agenois and Bazadois, subdivisions of Guienne; and of Condomois and Lomagne, subdivisions of Gascogne.

LOTHAIRE. [GERMANY.]

LOTHARINGIA. [LORRAINE.]

LOTHIANS is a term under which that part of Scotland is comprehended which stretches along the southern shores of the Frith of Forth, and includes the three counties of Haddington, Edinburgh, and Linlithgow. The first of these counties is also called East Lothian, the second Mid Lothian, and the last West Lothian. This region lies between 56° 40′ and 56° 5′ N. lat., and between 2° 24′ and 3° 50′ W. long.

Coast-Line.—The Lammermuir Hills terminate on the east in Berwickshire with the bold and rocky promontory of St. Abb's Head, which attains the elevation of 286 feet above the sea. From this point the coast, trending north of west, continues rocky and steep as far as Fast Castle, and its average elevation is hardly less than 200 feet. Farther west it sinks lower, but still presents precipices and crags to the sea, which rise to about the height of 100 feet. Its character is somewhat changed where Haddingtonshire begins: though it continues to be rocky, the shores rise with a gentle slope to a moderate height; but west of Dunbar Castle craggy cliffs and precipices again appear, which at last disappear under the sands of Belhaven. A low and sandy beach extends on both sides of the mouth of the Tyne; on the north it continues to the mouth of the Peffer, with the exception of the small promontory of Whitberry, which rises to a moderate elevation. But north of the mouth of the Peffer the cliffs are precipitous and rugged, in some places not less than 100 feet high, and overhang the sea. Tantallan Castle stands on a high rock surrounded by the sea on three sides. The coast continues high, but less precipitous, as far as New Berwick: west of that place it is flat and sandy for eight miles; but as we advance farther westward it becomes rocky near Chapel Ness, and in some places almost bold: this character continues to Gulan Ness. The beach of Aberlady Bay is flat and sandy, and so is the remainder of the shores of East Lothian, except some small portions of it near Graigielaw, Boglehill, and west of Preston Pans, where it is several feet high. The shores of Mid Lothian are low and sandy as far as Leith, and some miles farther west; but as we approach the mouth of the river Amond, which forms the boundary between Mid and West Lothian, they are intersected by some hills of moderate elevation. The coast rises somewhat higher west of the Amond, where it attains, on an average, an elevation of between 50 and 60 feet, and so it continues as far as Black Ness, where it begins to lower, until, west of Borrowstounness, it sinks so low that more than 2000 acres are covered by the tide.

Surface, Soil, and Rivers.—Nearly all the high lands in which the rivers originate that flow southward to the Tweed, and northward to the North Sea and Frith of Forth, lie within the Lothians, and the elevated ground which constitutes the northern edge of the basin of the Clyde extends along their boundary. The whole region may be considered as divided by nature into three portions. The most eastern comprehends the whole of East Lothian and a small portion of Mid Lothian, having for its natural boundary a range of hills which constitute the eastern boundary of the basin of the Esk, and extend from Borthwick to Inveresk: they are called, at least towards their northern termination, the Hills of Falside and Carberry. The second portion comprehends the country between this range and the Leith Water, and contains the Pentland Hills. The third division extends from Leith Water to the river Avon, which separates West Lothian from Stirlingshire.

The eastern region comprehends the greater portion of the Lammermuir range, of which the remainder belongs to Berwickshire. These hills constitute within East Lothian a continuous chain, beginning at the Lammerlaw (about 2° 50′ W. long.), and running north-east to the Sayers Law; their course thence to St. Abb's Head is nearly east. The highest summits of this chain are Lammerlaw, about 1700 feet, and Sayers Law, 1739. Towards the north this ridge terminates rather abruptly; but towards the south it sends off several ridges, which extend in a south-eastern direction, and contain several high summits. Spartleton or Spartledown Law is 1620 feet high. That portion of East Lothian which is included within the Lammermuir Hills contains many deep valleys, through each of which flows a river scarcely perceptible in summer, but in winter forming a very considerable torrent. The beds of the rivers are wide, and formed by the débris of the mountains through which they flow. The valleys are rather narrow and of moderate fertility, but they are under cultivation. The hills are mostly covered with muir or moss, but are capable of improvement. This elevated district is sometimes covered with snow for three months.

From the Lammerlaw a series of hills extends south-westward to Fala Hill. They are connected by high ground with one another, and are commonly called the Soutrie Hills, from one of the highest summits. They attain an elevation of near 1000 feet. West of them the watershed between the Gala Water, a tributary of the Tweed, and the Borthwick, is formed by a table-land of an uneven surface, but without any distinct ridge. It extends on both sides of the Gore Water, a tributary of the Esk, and is called Borthwick Muir. Its elevation above the sea is between 500 and 600 feet, and its surface is chiefly covered with moss or heath. The Gore Water runs in a narrow and deep valley of very moderate fertility. In this muir, north-west of Borthwick, rise the Falside and Carberry Hills, which run northward between Crichton and Cranston on the east, and Cockpen and Dalkeith on the west, and terminate two miles south-east of Inveresk. Their elevation varies from 500 to 700 feet.

The country between the Soutrie Hills, Borthwick Muir, and the Carberry ridge partakes much of the character of the muir, but the elevations are higher, being on an average 200 feet above the base, which, near the Soutrie Hills, is 600 feet above the sea, though it lowers considerably farther north. Most of this tract is covered with heath, but other portions are green, though they are intersected with bogs. Along the rivers there are small tracts of good land.

The country skirting the Lammermuir Hills on the north is rather undulating than hilly: its elevations have gentle slopes, and rise hardly more than 100 feet above their base, which varies in height above the sea from about 600 feet near the hills to 250 feet towards the Tyne. The highest hills in this tract are Skimmer Hill near Salton (600 feet above the sea) and Down Hill near Scott (550 feet). This tract does not contain much moorland; and though many parts near the Lammermuir have a sandy and rather sterile surface, the remainder is tolerably fertile, and produces good crops. The northern boundary-line of this tract begins on the east at Broxmouth, east of Dunbar, and follows a low ridge of elevated ground which runs westward near Spott, Stenton, Garvald, and Gifford, whence it passes to Salton.

From this line the country slopes gradually towards the river Tyne, without forming any hills, except the Traprain Hill, in the parish of Preston-kirk, which rises abruptly on all sides, and on the south is nearly perpendicular. This district, which is between two and four miles wide, contains the most fertile lands of East Lothian, and produces very rich crops of wheat and other grains. Along the Tyne there are rich meadow-lands, especially towards the mouth of the river.

The Tyne originates in two branches in the Carberry Hills and on Borthwick Muir. The northern branch, called the Tyne, unites with the southern, called Salton Water, near Salton House: at the junction the latter is the more considerable river. From Salton House the river runs in a general north-east direction with numerous windings to its mouth. At Linton it traverses a ledge of rocks, which formerly caused a waterfall about two feet high, but the rock has been lately cleared away. The tide ascends the river two miles from its mouth. The whole course of the Tyne is about 30 miles.

From the Hills of Falside, south-east of Inveresk, some high ground runs in a north-east direction, being nearly equally distant from the churches of Tranent and Pencaitland. Farther east the churches of Gladsmuir and Adelstanford are built on its highest elevation, and between them are the Garleton Hills, the most elevated part of these high lands. From Adelstanford they extend eastward to the village of Linton, where they terminate with a very gradual descent. The soil on these high lands is of inferior quality; but on the gentle declivities, with which they sink towards the sea and the river Tyne, it is characterized by fertility, especially on the southern slope, which terminates near the Tyne in rich meadows.

The northern slope of this ridge terminates east of the Garleton Hills in the valley of the Peffer. This valley traverses East Lothian from Aberlady Bay on the west to Peffer Sands on the east. The rivulet which traverses it, the Peffer, rises in a swampy meadow east of Congleton, and immediately divides into two branches, of which one flows eastward, and enters the sea north of Tyninghame, and the other runs slowly to Aberlady Bay. The former runs about five and the latter about eight miles. Their common source is said to be 25 or 30 feet above the sea. The valley, which is from one to two miles wide, was formerly occupied by swampy grounds, which have been drained and converted into meadows and fields of considerable value.

The tract of land north of the valley of the Peffer is chiefly occupied by some high ground running nearly west and east from Gulan Ness to Tantallan Castle. South-east of New Berwick is the New Berwick Hill, which is 800 feet high. The more elevated portion of this region is not cultivated, but the lower ground produces moderate crops of grain. Some large tracts near the sea-shore are low, and mostly covered with sand.

The south-eastern portion of the *middle* region, which extends from Carberry Hill to Leith Water, may be considered as a continuation of Borthwick Muir, to which it is contiguous. The whole tract between the Borthwick Muir and the two great branches of the Esk is a table-land, on which numerous small hills are dispersed, and which in the southern parts is about 600 feet above the sea; but towards the union of the two Esks, about two miles south of New Battle, it gradually sinks down to a lower level. The higher part of this tract, like Borthwick Muir, is covered with heath or consists of moorland, and contains only narrow strips of land along the rivers suitable for agricultural purposes. The hills which occur along the watershed between the Esk and the tributaries of the Tweed rise between 100 and 200 feet above their base: it is only near the source of Moorfoot Water that they attain a much higher elevation, the Blackhope Scares, east of the course of the river, rising to 1850 feet, and Coatlaw, west of it, to 1680 feet.

The Pentland Hills occupy the greatest part of the country between the Esk and Leith Water. The southern portion of these hills, running along the boundary-line of Mid Lothian and Peebles, is called Cairnedge, and contains the Cairnhill, about 1800 feet high. This ridge runs nearly east and west, and at its eastern extremity is connected with the Bevelaw-edge, the highest part of the Pentland Hills, whose summits in general attain an elevation of from 1300 to 1600 feet. Logan-house Hill is more than 1700 feet high, and Capelaw 1550; Caerketan with which the range terminates, south-east of Collington, attains about 1450 feet. The highest summits occupy nearly the middle of the tract between both rivers, but their declivities and offsets generally extend to the very banks of the streams or to a short distance from them. The base on which the Pentland Hills stand does not appear to exceed 600 feet in elevation; the sides of the hills are steep, and are only used as sheep-walks; in the narrow valleys the arable land, which occurs only in small patches, is of moderate fertility.

The northern declivity of the Pentland Hills terminates on the east at Laswade, and farther west a mile south of Liberton and about the same distance east of Collington. The country to the north of this line and extending to the shores of the Frith of Forth presents in general an undulating surface with a few hills on it, among which Arthur's Seat, near Edinburgh, is the highest. The most elevated part of this tract may be from 250 to 300 feet above the sea, but it lowers gradually as it approaches the Frith, where it terminates in a low shore. It contains the most fertile and best cultivated portion of Mid Lothian, though its soil is far from being of the first quality.

The *western* region, comprehending the western districts of Mid Lothian and the whole of West Lothian, contains in the southern parts extensive tracts covered with mosses and heath. The surface frequently extends in plains, and hills of moderate elevation are not common, except in some places on the watershed between the rivers which fall into the Frith and the tributaries of the Clyde. Some of these hills attain a height of 900 or 1000 feet; and the most western, the Levens Seat, is probably more than 1200 feet above the sea. The rivers do not run in narrow glens, as in the moorlands east of the Pentland Hills, and the arable ground along their banks is much more extensive and more fertile; but the greater portion of the tract is unfit for agricultural purposes. A line drawn from Currie on the Leith Water to Kirknewton and Mid Calder in Mid Lothian, and thence to Livingstone and Bathgate in Linlithgow, may be considered as the northern boundary of this tract.

The country north of this line resembles in soil and surface the tract north of the Pentland Hills, but the differences in the level are much greater, and its descent is far from being so uniform. The greatest portion of this country does not slope towards the sea, but towards the river Amond, which traverses it nearly in the centre. The basin of that river is bordered by higher ground, which in some places rises into hills. Of these hills there are in Mid Lothian the three hills of Dalmahoy and Kaims between Leith Water and Ormiston Water, of which the most southern attains 680 and the most northern 660 feet; and the Corstorphine Hills, west of Edinburgh, which extend two miles from south-east to north-west, and rise to 460 feet; they are steep towards the east and north. The hills which rise on the borders of the basin of the Amond in West Lothian occupy a larger surface. They begin east of Bathgate and run northward under the names of Dumcross Hills, Knock Hills, and Kipp Hills; east of Torpichen is their highest summit, the Cairn Naple, which is 1498 feet high. They terminate south of Linlithgow with the Cocklerue, 500 feet high. From the last-mentioned hill the high ground runs eastward, forming moderate elevations with gentle descents until it terminates a short distance from the mouth of the Amond. The country enclosed by these high grounds contains a greater portion of arable ground than any other part of the Lothians, except the Vale of the Tyne.

The south-eastern portion of Mid Lothian belongs to the basin of the Tweed. Though contiguous to the Muir of Borthwick, it presents a different character, its surface being formed by ridges of high hills, between which the rivers run in deep and mostly narrow valleys. The hills rise probably to 1000 feet; the Tippetknows, on the boundary-line between Mid Lothian and Berwickshire, attains 1323 feet. The arable ground in the valleys is of only moderate fertility, but the hills afford good sheep-walks.

Geology.—The Lammermuir Hills consist of a series of transition rocks. They are almost entirely composed of grauwacke, distinctly stratified, but in various places trap rocks protrude through the strata, and between the ridges old red sandstone occurs, which fills up to a certain level most of the valley, especially along the rivulets. Along the northern declivity the hills are covered by a conglomerate, consisting almost entirely of fragments of grauwacke slate coarsely cemented together, and forming in many places large and elevated mountain-masses. This conglomerate is frequently traversed by rocks of a coarse sandstone and projecting dikes or veins of trap, and extends to some distance from the hills. The lower ridges which skirt the hills are composed of the red sandstone, which extends to the ridge running from Broxmouth to Gifford, and then, at least towards the sea, is followed by a low tract belonging to the coal-formation; for though it is covered with a deep and fertile soil, the cliffs along the shore as far as Dunbar exhibit limestone, clay, ironstone, bituminous shale, and occasionally thin seams of coal, with some organic remains.

In the country north of the Tyne the surface consists of claystone, clinkstone, and limestone, where it is not covered with mould. The upper stratum however is partly traversed by and partly rests on the red sandstone, which forms the regular strata of this district. The sandstone rests on the transition rocks of the Lammermuir Hills, and is in some places covered by the coal-formation of Mid Lothian. In a few places basalt and trap rocks are met with.

On the western extremity of the Lammermuir Hills the coal-formation begins, which extends through the whole of the southern districts of Mid and West Lothian. The great coal-field lies to the east and south of Edinburgh, where it extends about 25 miles in length, its greatest breadth being six miles. It is calculated to cover an area of 80 square miles. Though the coal-formation continues farther westward, it is intersected by extensive tracts of limestone and sandstone, in which only small seams of coal occur. But in the hills near Bathgate the coal-formation again predominates, and beds of coal occur there which are fit for working, and extend westward into Lanarkshire. The country between the coal-formation and the Frith of Forth belongs to the red sandstone, consisting mostly of limestone and sandstone, through which at several places trap and basalt rocks protrude.

Lothian, under the names of Landen, Lodoneia, and Lothian, antiently comprehended all the country lying between the rivers Tweed and Forth as far west as the river Avon, which separates the counties of Linlithgow and Stirling. It consequently included the whole of Berwickshire and part of the counties of Roxburgh, Selkirk, and Peebles, in addition to the three counties of Haddington, Edinburgh, and Linlithgow, which three alone constitute the district now known under the appellation of the 'Lothians.' This fertile district was inhabited by the British until their expulsion by the Saxons about the middle of the fifth century. Soon after the union of the Picts and Scots (A.D. 843) Kenneth Macalpine made incursions into Saxonia, as Lothian was then called, but did not succeed in obtaining any permanent possession. It subsequently became included in the bishopric of Durham, and in the year 1020 was ceded to Malcolm II. by the duke of Northumberland, but Lothian continued to be known as a country distinct from Scotland even as late as the reign of David I. (A.D. 1124). The eastern boundary appears to have been restricted to the Lammermuir hills about the middle of the twelfth century, during the reign of William, surnamed the Lion, and to have been then also first divided into East Lothian [HADDINGTONSHIRE], West Lothian [LINLITHGOWSHIRE], and Mid-Lothian [EDINBURGHSHIRE].

With reference to Edinburghshire, the following table, showing the state of the parish-schools of that county at the end of the year 1825, has been compiled from the Returns made by the parochial ministers to Parliament in 1826. In the parishes of Canongate, College Church, High Church, Lady Yesters, New Grey Friars, New North Church, Old Church, Old Grey Friars, St. Andrew, St. Cuthbert, St. George, St. Mary, Tolbooth Kirk, and Tron Church, there are no parochial schools, but in these, as in most of the other parishes, there are schools established on what is called the 'legal provision,' besides private schools, and the number of scholars attending them is very considerable. (Camden's *Brit.*; Chalmers's *Caledonia*; *Old* and *New Statistical Account of Scotland*, &c.)

LOTIONS, or washes, termed also epithems, and when intended for the eye, collyria, or eye-washes, are either mixtures of different ingredients, or solutions of various medicinal substances, in water or other menstrua, designed for external application. If the object be to reduce the temperature of a part, they are generally formed of spirituous or other volatile principles, which by their evaporation occasion cold (and such must be applied by means of a very thin single layer of linen), or of saline bodies, which at the moment of their solution cause a reduced temperature, and which should be applied immediately after being mixed, and frequently renewed. Others are composed of stimulating substances, and are intended to impart power to indolent tumours or ulcers, while a different set are designed to allay pain, and are composed of sedative or narcotic principles.

Many of the nostrums sold under the name of lotions are solutions of very active ingredients, and their application is often productive of very serious effects.

LOTTERIES are schemes by which some modern governments have raised a revenue from their subjects, by taking advantage of that feeling of confidence in their own good fortune which is entertained by a large proportion of mankind. The plan upon which lotteries have generally been conducted is that of selling for more than their intrinsic worth a certain number of tickets or chances, and distributing by lot a part only of the money thus collected among a comparatively small number of the purchasers. Lotteries may thus be considered as games of chance, the aggregate number of players in which are sure to lose a part of their venture. During the period in which the English state lotteries were carried on by act of parliament, it was the plan to distribute in prizes of different magnitudes an amount equal to 10*l.* for each ticket or chance that was issued, and the profit to the state consisted of the sum beyond that rate which contractors were willing to give for the privilege of selling to the public the tickets or shares of tickets, which for that purpose they might divide into halves, quarters, eighths, and sixteenths of tickets. The price paid by the contractors for this privilege varied with circumstances, but was usually about six or seven pounds per ticket beyond the amount repaid in prizes, while the price charged by the contractors to the public was generally four or five pounds per ticket beyond that paid to the government, and more than this rate of advance was always required when the tickets were divided into shares, the smaller shares being charged more in proportion than the larger.

The invention of lotteries is ascribed to the Romans. It does not appear that they were resorted to for purposes of revenue, but rather as a means of amusing and gratifying the people, among whom the tickets were gratuitously distributed, the prizes being of but little value. The earliest English lottery of which there is any record occurred in 1569, when 40,000 chances were sold at ten shillings each; the prizes consisted of articles of plate, and the profit was employed for the repair of certain harbours. In the course of the following century the spirit of gambling appears to have materially increased in this direction, for private lotteries were, early in the reign of Queen Anne, suppressed 'as public nuisances.' In the early period of the history of the National Debt of England, it was usual to pay the prizes in the state lotteries in the form of terminable annuities. In 1694 a loan of a million was raised by the sale of lottery tickets at 10*l.* per ticket, the prizes in which were funded at the rate of 14 per cent. for sixteen years certain. In 1746 a loan of three millions was raised on 4 per cent. annuities, and a lottery of 50,000 tickets at 10*l.* each; and in the following year one million was raised by the sale of 100,000 tickets, the prizes in which were funded in perpetual annuities at the rate of 4 per cent. per annum. Probably the last occasion on which the taste for gambling was thus made use of occurred in 1780, when every subscriber of 1000*l.* towards a loan of twelve millions at 4 per cent. received a bonus of four lottery tickets, the intrinsic value of each of which was 10*l.*

In 1778 an act was passed obliging every person who kept a lottery-office to take out a yearly licence, and to pay 50*l.* for the same, a measure which reduced the number of lottery-offices from 400 to 51.

The immorality on the part of the government, in thus encouraging a spirit of gambling among the generality of the people, became very soon apparent. By limiting the subdivision of chances to the sixteenth of a ticket as the minimum, it was intended to prevent the labouring population from risking their earnings, but this limitation was extensively and easily evaded by means which aggravated the evil, the keepers of these illegal offices (commonly known as 'little goes') and insurance offices requiring extra profits to cover the chances of detection and punishment. All the efforts of the police were ineffectual for the suppression of these illegal proceedings, and for many years a great and growing repugnance was in consequence manifested in parliament to this method of raising any part of the public revenue. At length, in 1823, the last act that was sanctioned by parliament for the sale of lottery tickets contained provisions for putting down all private lotteries, and for rendering illegal the sale, in this kingdom, of all tickets or shares of tickets in any foreign lottery, which latter provision is, to this day, extensively evaded.

The system of state lotteries was very long carried on by the French government, and was the cause of still greater demoralization than in England. Recently, state lotteries have also been abolished in France.

The Hamburg lottery, which is still continued, is established upon a fairer principle than was adopted in France or England. The whole money for which the tickets are sold is distributed among the buyers, except a deduction of 10 per cent. which is made from the amount of the prizes at the time of their payment.

Lotteries have been very common in the United States, and have been sanctioned by the several states, not so much as a means of raising money for state purposes, as with the view of encouraging, as they supposed, many useful objects which could only be effected by raising at once a large sum of money, such as canals, the establishment of schools, and even the publication of a book. The numerous frauds practised in lottery schemes in the United States have perhaps done more to open the eyes of the people to the mischief resulting from them than any investigation into the true principles of lotteries. A distinguished American lawyer, who figured in the New York State Convention about twenty years ago, declared that though 'he was no friend to lotteries, he could not admit they were *per se* criminal or immoral, when authorized by law. If they were nuisances, it was in the manner in which they were managed. In England, if not in France, there were lotteries annually sanctioned by government, and it was considered a fair way to reach the pockets of misers and persons disposed to speculate their funds. The American Congress of 1776 had instituted a national lottery, and perhaps no body of men ever surpassed them in intelligence and virtue.' These remarks are merely quoted in order to show what a man of high character in America for integrity and knowledge thought of lotteries twenty years ago. The opinions which he expressed were at that time, we may venture to say, shared by a great number. We should be inclined to think that juster views are now prevailing there as to the subject of lotteries; but we have no recent information on the subject.

LOTUS of the Antients. The plant or plants referred to by classical authors under the name of Lotus is a subject which has engaged the attention of numerous commentators as well as of botanists. To the difficulty of ascertaining the identity of a plant but imperfectly described has in this case been added that of the same name having been applied to several very distinct plants. Fée, the latest author (*Flore de Virgile*), enumerates no less than eleven to which the name Lotus was applied: it is unnecessary here to enumerate more than the most remarkable. Of these, some are herbaceous, others perennial. Among the former are the *Lotus sativa* and *sylvestris* of Dioscorides: the first, he states, is also called *trifolium*; it is supposed by some botanists to be *Melilotus officinalis*, and by others to be *M. cœrulea*. Dr. Sibthorp has fixed upon *Melilotus messanensis* as the plant.

The *Lotus sylvestris* of Dioscorides, called also *libyca*, a native of Libya, and about two feet high, with leaves like those of Lotus trifolium, and fruit like that of fenugreek, is thought to be the Trigonella elatior of Sibthorp, which he found in Asia Minor and in Cyprus. Both kinds are described by the Arabs under the name of *handakoka*, or *handkookee*, with *gareh* and *thaaf* as other Arabic names. From the great number of similar plants of the tribe of Loteæ which are employed by Asiatics as articles of diet or as medicines, it is impossible, without specimens, to identify either of the above, but they are probably allied to the Melilotus.

Lotus ægyptia, or the Egyptian Lotus, is no doubt one of the *Nymphæaceæ*, being described as springing up in Egypt in fields inundated by the river, with a stem like that of the *cyamus*, or Egyptian bean (*Nelumbium speciosum*), and a white liliaceous flower, which rises out of the water at sun-rise, and sinks down again at its setting, a capsule like that of the poppy, in which are contained seeds which the Egyptians roast and make into bread, with a root which is likewise eaten, both in a dressed and undressed state. The plant is no doubt the *Nymphæa Lotus* of botanists. But as in the most antient monuments a blue-coloured lotus is likewise represented, there is no doubt that the Egyptians were also acquainted with the *Nymphæa cærulea*. At the present day, the seeds of several Nymphæas roasted in sand are eaten by the natives of India, as are likewise the stalks and the rootstocks, which is said to have been the case with the Egyptian species. As the flowers of the Nymphæaceæ are so highly esteemed by the Hindus, and notices respecting them constantly occur in their poetry and mythology, it is possible that an Eastern legend may have given origin to the metamorphosis of the nymph Lotis, flying from Priapus, into the 'aquatica lotus.' (Ovid, *Metamorph.*, ix. 341.)

The Egyptian lotus however is not so celebrated as another less known tree, to which exaggerated description has assigned a fruit of the most delicious kind, upon which the Lotophagi lived, and which, when strangers had once tasted, they ceased to wish to return to their native country. This is specially described as a tree, but there is no doubt that several have been confounded under this name. One is described both by Dioscorides and Pliny as a native of Italy of great size, forming excellent wood, with fruit about the size of pepper and as resembling that of the cherry. This description applies very closely to the Celtis Australis, or European lote or nettle-tree, which is one of the largest timber-trees of the South of Europe, with wood of considerable hardness and toughness. It produces berries about the size of small cherries and with long stalks like them, eaten both by birds and children.

This however comes far short of the character of the Lotos of the Lotophagi, of which the best description, according to Sprengel, is that of Polybius, who states that it was a moderate-sized thorny tree, with leaves like those of Rhamnus, but broader; that the fruit at first was like the white berries of myrtle, but became as large as an olive, of a reddish colour, and containing a small nut, taste sweetish, resembling that of figs or dates; and that a wine was prepared from it. That this tree was a native of Africa we know from the Lotophagi, who employed the fruit as their chief food, being a people of the African coast near the Syrtes. (Herod., iv. 177.) Arabian authors, in their translation of the works of the Greeks, give the synonyms in both languages, and we have, in the chapter of Serapion, retranslated into Latin, 'De loto arbore,' the name *sidr* or *sidar*, given as the Arabic name of the tree, and *nabach*. *nibuk*, or *nabk*, as that of its fruit. This name has been long known as that of a species of Zizyphus, and has been applied by botanists to one species, *Z. Napeca.* Dr. Shaw, in his 'Travels in Barbary,' figures a species of Zizyphus, which he calls 'Seedra Arabum, quæ et Lotus veterum.' It is a prickly branching shrub, with fruit of the size of a wild plum, and of a sweetish taste and saffron colour. He found it sold in the markets, cattle fed with it, and a liquor drawn from it. Desfontaines also found this *Zizyphus Lotus* on the same coast, and has fully described it. Mungo Park found a species of Zizyphus in the interior of Africa, which forms a large tree with yellow farinaceous berries of a delicious taste. The natives, he says, convert them into a sort of bread, by exposing them some days to the sun, and afterwards pounding them gently in a mortar, until the farinaceous part is separated from the stone. This meal is then mixed with a little water, and formed into cakes, which, when dried in the sun, resemble the sweetest gingerbread. It may be added, that the fruit of several species of Zizyphus is eaten in India. One kind, commonly known by the name *ber*, forms a moderate-sized tree in a cultivated state, with oval fruit of a yellowish or reddish colour, and about the size or somewhat smaller than a common plum, which is much esteemed. The taste is mild and sweet, with a slight degree of acidity, probably coming nearer to the taste of dates than any other fruit. In Persian works, *berree* and *jharree* are given as its Hindustanee, *kinar* and *khial* as its Persian, and *sidr* as its Arabic name, with *nebbe* for the fruit. The fruit of the wild kind is dried and powdered, as was done with the lotus of the Lotophagi. This powder, in Arabic, is called *savikoon-nebbek*, in Persian, *arud-i-kinar*, and in Hindu, *ber-choonee*.

LOUDE'AC, a town in France in the department of Côtes du Nord, near the river Oust, a tributary of the Vilaine, and on the southern slope of the Menez mountains. The population in 1831 was 6736 for the whole commune; in 1836 it was 6865 for the commune. The principal manufactures are linen-thread and linens, which also constitute the chief articles of trade. There is a monthly fair for linens, horses and cattle. There are an agricultural society and an institution for instruction in drawing. There are some fiscal government offices.

Loudéac is the capital of an arrondissement which contains 551 square miles. It is divided into nine cantons, and fifty-six communes. The population of the arrondissement was 98,604 in 1831; 95,102 in 1836: a considerable number of the inhabitants are engaged in the linen manufacture.

LOUDUN. [VIENNE.]

LOUGH DIVER, a provincial name for the bird called the *Smew* (*Mergus albellus*, Linn.).

LOUGHBOROUGH. [LEICESTERSHIRE.]

LOUGHREA. [GALWAY.]

LOUIS (LUDWIG in German, LUDOVICUS in Latin) is the name of many kings of France. Louis I., called 'le Débonnaire,' and also 'the Pious,' son of Charlemagne, was made his father's colleague in the empire, A.D. 813, and after the death of Charlemagne, in the following year, he succeeded him as king of France and emperor of the West. Bernard, son of Pepin, elder brother of Louis, had been made by his grandfather king of Italy, or rather Lombardy ('quæ et Longobardia dicitur' are the expressions of the chroniclers), which kingdom was defined in Charlemagne's will as being bounded by the Ticino and the Po as far as the territories of Reggio and Bologna. All to the west of the Ticino and south of the Po was then annexed to the French crown. Bernard, having conspired to supplant his uncle in the empire, was seized by order of Louis, and his eyes were put out, in consequence of which he died in a few days. Louis showed great sorrow for this act of cruelty, to which he had been advised by his courtiers, and he did public penance for it before an assembly of bishops. In the year 820 Louis appointed his son Lotharius king of Italy and his colleague in the empire. To his son Louis he gave Bavaria, Bohemia, and Carinthia, and to his other son, Pepin, he gave Aquitania. In 830 Lotharius and Pepin revolted against their father, on the plea of the bad conduct of their step-mother Judith of Bavaria, a licentious and ambitious woman. At a diet however which was held at Aix-la-Chapelle, the father and sons were reconciled. The sons revolted again in 833, and their father, being forsaken by his followers, was obliged to give himself up to his son Lotharius, who took him as prisoner to Soissons, sent the empress Judith to Tortona, and confined her infant son Charles, afterwards Charles the Bald, the object of the jealousy of his half-brothers, in a monastery. A meeting of bishops was held at Compiègne, at which the archbishop of Rheims presided, and the unfortunate Louis, being arraigned before it, was found guilty of the murder of his nephew Bernard, and of sundry other offences. Being deposed, he was compelled to do public penance in sackcloth, and was kept in confinement. In the following year however Louis, king of Bavaria, took his father's part, his brother Pepin of Aquitania joined him, and they obliged Lotharius to deliver up their father, who was reinstated on the imperial throne. Lotharius, after some further resistance, made his submission and returned to Italy. The emperor Louis now assigned to Charles, son of Judith, the kingdom of Neustria, or Eastern France, including Paris, and Pepin having died soon after, Aquitania was added to Charles's portion. Lotharius had all Italy, with Provence, Lyon, Suabia, Austrasia, and Saxony. But Louis of Bavaria claimed all Germany as far as the Rhine for himself, and invaded Suabia. The emperor Louis marched against him, and a diet was assembled at Worms to judge his rebellious son, but meantime the emperor fell ill, and died in an island of the Rhine near Mainz, in June, 840, after sending to his son Lotharius the imperial crown, his sword, and his sceptre. Lotharius was acknowledged as emperor, and after a war against his brothers, he retained Italy, Provence, Burgundy, and Lorraine. Charles the Bald succeeded his father as king of France, and Louis of Bavaria had all Germany. Thus was the imperial crown separated from that of France. The emperor Louis was a weak prince. . It was under his reign that the fiefs were first made transmissible by descent, which hitherto had been held for life only. Louis also allowed the popes elect to take possession of their charge without waiting for his confirmation. (Hénault, *Abrégé de l'Histoire de France*; Dunham, *History of the Germanic Empire*.)

LOUIS II., called 'le Bègue,' or 'the Stammerer,' son of Charles the Bald, succeeded his father on the throne of France in 877. He claimed also the imperial crown against his cousin Carloman, son of Louis the German, but with no success. In France also he was opposed by several great lords, among others by Boson, the brother of his stepmother, Richilda. In order to conciliate them, he followed the example of his father, by parcelling out the domain of the crown into fiefs in favour of his vassals. He died at Compiègne in 879, at the age of 35, leaving three sons, Louis, Carloman, and Charles called 'the Simple.'

LOUIS III. succeeded his father Louis II., together with his brother Carloman. Louis had Neustria, and Carloman Aquitania. Boson founded the kingdom of Arles, which included Provence, Dauphiny, Lyon, Savoy, and Franche Comté. The Normans ravaged the northern coasts of France, where at last they settled. Louis died in 882, and his brother Carloman remained sole king of France.

LOUIS IV., son of Charles the Simple, ascended the throne of France in 936. He sustained several wars against the emperor Otho I. on the subject of Lotharingia or Lorraine, and also against the Normans, whose duke William, son of Rollo, died, leaving an infant son, Richard. Louis's reign was also disturbed by revolts of the great vassals, especially of Hugo, count of Laon, the father of Hugo Capet. Louis died in 954, and was succeeded by his son Lotharius.

LOUIS V., styled 'the Fainéant,' or 'do nothing,' son of Lotharius, succeeded him in 986. He reigned only one year, and died of poison, administered, as it was said, by his wife, the daughter of an Aquitanian lord. With him ended the Carlovingian dynasty, and Hugo Capet took possession of the throne.

LOUIS VI., called 'le Gros,' son of Philip I., succeeded his father on the throne of France in the year 1108. The larger part of the kingdom was then in the hands of the great vassals of the crown, over whom the king's supremacy was but nominal. The king's direct authority extended only over Paris, Orléans, Étampes, Compiègne, Melun, Bourges, and a few more towns, with their respective territories. The duchy of Normandy was in the possession of Henry I. of England, who had taken it from his brother Robert during the preceding reign of Philip I. Henry and Louis quarrelled about the limits of their respective states, and thus began the wars between the English and the French in France, which lasted for more than three centuries. Louis had the worst in several encounters. In 1120 he made peace, but war broke out again, when Henry of England was joined by his son-in-law the emperor Henry V., who entered Champagne, where he was met by Louis at the head of all his vassals, lay and ecclesiastical: even Suger, abbot of St. Denis, was there with the subjects of the abbey. These united forces are said to have amounted to 200,000 men, and the emperor thought it prudent to retire. Louis however could not depend on the same zealous assistance from his vassals in his quarrel with Henry of England as duke of Normandy, because the vassals considered it as their interest not to increase the power of their king. Meantime Henry of England having given one of his daughters in marriage to Conan, son of the duke of Brittany, the latter did homage to Henry for Brittany as a fief of Normandy. (Hénault, *Abrégé de l'Histoire de France*.)

Louis le Gros assisted by his able minister l'Abbé Suger, succeeded in recovering for the crown some of the power which the great vassals had usurped; he revived the practice of Charlemagne of sending into the provinces commissioners called 'missi dominici,' who watched the judicial proceedings of the great lords in their respective domains, and received appeals and complaints, which they referred to the king for judgment at the great assizes. In most cases however the king had not the power of enforcing his own judgments. But another and a more effective measure of Louis le Gros was the establishment of the communes, for which he deserves to be remembered among the earliest benefactors of the French people. He granted charters to many towns, the inhabitants of which were thereby empowered to choose their local magistrates, and administer the affairs of the community, subject however to the sanction of the king. By this means he began the creation of the third estate, or commons, as a check on the overgrown power of the feudal nobles. A good sketch of the history of the French communes is contained in the 'Exposé des Motifs de la Loi Municipale,' pronounced by M. de Martignac, Minister of the Interior, in the House of Deputies, 9 February, 1829. Louis le Gros died at Paris in 1137, at the age of sixty, and was buried at St. Denis. He was succeeded by his son Louis VII., to whom he gave the following warning on his death-bed: 'Remember, my son, and always bear in mind, that the royal authority is a public charge, of which you must expect to render a strict account after your death.'

LOUIS VII., called 'Le Jeune,' son of Louis le Gros, succeeded his father in 1137. He married Eleanor, daughter and heiress of William, duke of Aquitaine, a lady who was handsome and inclined to gallantry. Thibaut, count of Champagne, having revolted against the king, Louis took and burnt his town of Vitry. St. Bernard, abbot of Clairvaux, advised Louis, in order to atone for this cruelty, to go on a crusade; but the Abbé Suger, who was minister of Louis, and had also served the king's father, opposed this project. The zeal of St. Bernard however prevailed, and the king set off with his wife and a large army in 1147. Suger and Raoul, count of Vermandois, Louis's brother-in-law, were left regents of the kingdom. The crusade proved unsuccessful: the Christians were defeated near Damascus, and Louis after several narrow escapes, returned to France in 1149. His first act after his arrival was to repudiate Eleanor, whose conduct during her residence in the East had been improper; but the bishops, to avoid scandal, dissolved the marriage on the plea that it was not valid because the king and queen were cousins. Suger, who was now dead, had strongly opposed on political grounds the dissolution of the marriage, and the event proved the justness of his foresight, for Eleanor married Henry of England and Normandy, afterwards Henry II., who by this marriage became possessed of Aquitaine, Poitou, Maine, and in fact of one-third of France, comprising the whole maritime territory from Nantes to Bayonne. Louis married Constance of Castile for his second wife. A war now broke out between him and Henry II. of England, which lasted several years, and ended by a peace in 1170, after which Henry as duke of Normandy and peer of France attended the coronation of Louis's son, Philip II., called 'Auguste,' in 1179. Louis died in September, 1180, at Paris, being sixty years of age.

LOUIS VIII., styled 'Cœur de Lion,' succeeded his father Philippe Auguste in 1223. Like his father, he was engaged in wars with the English, from whom he took the Limousin, Perigord, Aunis, and all the rest of the country north of the Garonne. At the request of the pope, he made war against the Albigenses, and laid siege to Avignon, where he died in 1226.

LOUIS IX., called St. Louis, succeeded his father Louis VIII. when he was twelve years of age, under the regency of his mother Blanche of Castile. During the minority of the king, there was a constant struggle between the crown and the great feudatories, at the head of whom were Thibaut, count of Champagne, and the count of Brittany. During this troubled period Queen Blanche displayed much character and considerable abilities. Her son, as soon as he was old enough, putting himself at the head of his faithful vassals, reduced the most refractory lords, and among others the count of Brittany, who came with a rope round his neck to ask pardon of the king, which was granted. Henry III. of England, who supported the rebels, was defeated by Louis near Saintes, upon which a truce of five years was signed between the two kings. During an illness Louis made a vow to visit the Holy Land, and in June, 1248, he set out for the East. He landed in Egypt, and took Damiat, but being defeated at the battle of Mansoura, he was taken prisoner, compelled to pay a heavy ransom, and to restore Damiat to the Mussulmans. From Egypt he sailed to Acre, and carried on the war in Palestine, but with no success, till the year 1254, when he returned to France. The best account of this expedition is by Joinville, who was present, 'Histoire de St. Louis,' edited by Ducange, with notes, folio, 1668. Louis on his return found ample occupation in checking the violence and oppressions of the nobles, whom he treated with wholesome rigour. He published several useful statutes, known by the title of 'Établissements de St. Louis;' he established a police at Paris, at the head of which he put a magistrate called prévôt; he classed the various trades into companies called confréries; he established the college of theology, called La Sorbonne from the name of his confessor; he created a French navy, and made an advantageous treaty with the king of Aragon, by which the respective limits and jurisdictions of the two states were defined. The chief and almost the only fault of Louis, which was that of his age, was his religious intolerance; he issued oppressive ordinances against the Jews, had a horror of heretics, and used to tell his friend Joinville 'that a layman ought not to dispute with the unbelievers, but strike them with a good sword across the body.' By an ordonnance he remitted to his Christian subjects the third of the debts which they owed to Jews, and this 'for the good of his soul.' (Martenne, *Thesaurus Anecdotorum*, vol. i., p. 950.) This same feeling of fanaticism led him to another crusade, against the advice of his best friends, in which he met his death. He sailed for Africa, laid siege to Tunis, and died in his camp, of the plague, in August, 1270. Pope Boniface VIII. canonized him as a saint in 1297. Louis's brother Charles, count of Anjou and Provence, took the kingdom of Naples from Manfred of Suabia, and established there the dynasty of Anjou. [ANJOU.] (Joinville, Matthew Paris, and the French historians.)

LOUIS X., called 'Hutin,' an old French word meaning 'quarrelsome,' son of Philippe le Bel, succeeded his father in 1314. His uncle Charles de Valois had the principal share of the government during his reign, although the king was of age. Louis imprisoned and put to death his wife Margaret in 1315, on the ground of adultery, and then married Clemence of Hungary. He carried on an unsuccessful war against the count of Flanders, to maintain which he increased the taxes, sold the judicial offices, and obliged the crown serfs to purchase their freedom. Louis died, after a short reign, in 1316, not without suspicions of poison. He was succeeded by his brother Philip V.

LOUIS XI., son of Charles VII., succeeded his father in 1461, being then thirty-nine years of age. He had early exhibited a duplicity of disposition, for which his father mistrusted him. He had revolted against his father in

1456, and being defeated, had taken refuge at the court of Philip, duke of Burgundy, who protected him and maintained him for six years, until his father's death. Louis, when king, became the bitterest enemy of Charles, the son of Philip. The principal events of his reign are connected with those of Charles, and are described under BOURGOGNE. The cautious cunning and consummate hypocrisy of Louis gave him the advantage over the rash courage and headlong passion of Charles, which at last caused his ruin and death at the siege of Nanci, in January, 1477. Louis was successful in depressing the power of the feudal nobles, several of whom he put to death, and in rendering the authority of the crown independent of them. He took into his service a body of Swiss, and kept also ten thousand French infantry, whom he paid out of his own treasury. He carried on a war against Maximilian of Austria, who had married Mary of Burgundy, daughter and heiress of Duke Charles, and took from him Artois and Franche Comté: but at last peace was made between them by the treaty of Arras, in 1482. Louis also made peace with Edward IV. of England. Charles of Anjou, count of Provence, bequeathed that province to Louis XI., as well as his claims to the thrones of Naples and Sicily, a bequest which led to the subsequent attempts of the French to conquer Naples. Louis XI. died in 1483, being sixty years of age. He was a strange compound of daring and superstition, of abilities and weakness, of firmness and perseverance in his political views, joined to an abject meanness of sentiment and habit. The taille, or direct taxation, was tripled under his reign. He was the first who assumed the title of 'Most Christian King,' which was given him by the pope in 1469. The best account of Louis XI. is given by his contemporary and confidant Comines, in his 'Mémoires.'

LOUIS XII., son of Charles, duke of Orleans, descended from a younger son of Charles V., succeeded, in 1498, Charles VIII., who had left no children. He had been obliged by Louis XI. to marry his daughter Joan in 1476, but after his accession to the throne he dissolved the marriage, and married Anne of Britanny, the widow of Charles VIII. Louis asserted his claims to the duchy of Milan, which were derived from his grandmother Valentina Visconti, daughter of John Galeazzo, duke of Milan, and sister of the last duke Filippo Maria, who had died without leaving legitimate children. But Filippo Maria left a natural daughter Bianca, who had married the famous condottiere Francesco Sforza, who succeeded his father-in-law as duke of Milan, and the Sforza family had been confirmed in the possession of the duchy by the emperor, Milan being considered as a fief of the empire. Francesco was succeeded by his son Galeazzo, who, being murdered in 1475, left an infant son Gian Galeazzo, whose uncle Ludovico assumed the government during his minority. After the death of Gian Galeazzo in 1494, Ludovico, who was suspected of having poisoned his nephew, was proclaimed Duke, and confirmed by a diploma of the emperor Maximilian I. Louis however marched with an army into Italy and took possession of the duchy of Milan in 1499. In the following year he made Ludovico Sforza prisoner, and carried him to France, where he died in confinement. Emboldened by this success, Louis now put forward the claims of the crown of France to the possession of Naples derived from the Anjous. [LOUIS XI.] These claims had already been asserted by his predecessor Charles VIII., who however, after invading Naples, was obliged to give up his conquest. The Aragonese dynasty had resumed possession of that kingdom; and Frederic of Aragon, who was king of Naples, feeling that he was too weak to resist Louis XII., applied for assistance to his relative Ferdinand the Catholic, king of Spain, who sent him an army under the celebrated commander Gonzalo of Cordova. Louis had recourse to secret negotiations; he proposed to Ferdinand of Spain to dethrone his relative and protegé, and to divide the kingdom of Naples between them. Such a proposal was exactly suited to the character of Ferdinand, and he assented to it. Whilst Louis marched against Naples, Gonzalo, in consequence of secret orders from his master, was occupying in his name the towns of Calabria and Puglia; and a third worthy partner in such a transaction, Pope Alexander VI., gave to Louis the solemn investiture of the crown of Naples, which he had a few years before bestowed upon the unfortunate Frederic. The latter, perceiving the perfidiousness of his Spanish relative, surrendered himself to Louis, who gave him the duchy of Anjou and a pension for life. Louis and Ferdinand soon quarrelled about their respective shares of the spoil, and Ferdinand gave orders to Gonzalo to drive away the French from Naples. The two battles of Seminara and Cerignola, both fought in April, 1503, in which the French were defeated by the Spaniards, decided the fate of the kingdom of Naples, which became entirely subject to Spain. A few years after Pope Julius II. formed a league with Ferdinand and the Swiss to drive the French out of Italy altogether; and after three campaigns, Gaston de-Foix, duke of Nemours, being killed at the battle of Ravenna, the French abandoned Lombardy; and Maximilian Sforza, son of Ludovico, supported by the Swiss, assumed the ducal crown of Milan in 1512. Louis sent a fresh army into Italy under La Trimouille, who was beaten at Novara by the Swiss, in June, 1513; and thus, after fifteen years of fighting, intrigues, and negotiations, the French lost all their conquests in Italy. Louis XII. has been styled by courtly historians 'the father of his people;' he was, in fact, kind-hearted towards his subjects, and he reduced the taxes by one-half; but his foreign policy was unjust and imprudent. In order to forward his ambitious purposes he allied himself to the atrocious Borgias and the unprincipled Ferdinand; and the calamities which his troops inflicted upon Italy, the horrors of the storming of Brescia, the cruel execution of Count Avogadro and his two sons because they resisted the invaders, and other atrocities committed by the French commanders, are great stains on the memory of this 'paternal' monarch. Having lost his best troops, he reluctantly gave up his Italian schemes, made peace with Ferdinand and the pope, and, at the age of fifty-three, married Mary, sister of Henry VIII. of England. His young wife made him forget his years and the weakness of his constitution: 'on her account,' says the biographer of Bayard, 'he changed all his mode of life; instead of dining at eight o'clock in the morning, or before, he fixed his dinner-hour at noon; and instead of going to bed at six in the evening, as heretofore, he often sat up till midnight.' He did not live quite three months after his marriage, and died at Paris, in January, 1515, leaving no male issue. He was succeeded by Francis I.

LOUIS XIII., son of Henri IV. and of Mary de' Medici, succeeded his father in 1610, being only nine years age, under the regency of his mother. In October, 1614, he was declared to be of age, and in the following year he married Anne, daughter of Philip III. of Spain. Concino Concini, maréchal d'Ancre, a Florentine, the favourite minister of the queen-dowager, had, by his insolence and his intrigues, excited the jealousy of many of the high nobility, with the prince of Condé at their head, who left the court and began a civil war. Louis XIII., who was impatient of the rule of his mother, and of the favourite, but had not spirit enough to shake it off, consulted with a young courtier called Luines, and by his advice ordered Vitri, an officer of his body-guard, to arrest the marshal. Vitri stopped him on the drawbridge of the Louvre: the marshal attempted to defend himself, upon which Vitri killed him. The people of Paris made great rejoicings at his death, dragged his body through the streets, cut it to pieces, and threw it into the river. The parliament of Paris declared him to have been guilty of treason and sorcery, and on the same grounds sentenced his wife, who was also a Florentine, named Galigai, to be beheaded, and her body burned, a sentence which was executed on the 8th July, 1617. This trial and sentence are amongst the most disgraceful of the old French judicature. The queen-dowager was sent to Blois under arrest. Luines now became the ruling favourite; for Louis was totally incapable of governing himself during the whole of his life. Some years after the queen-dowager escaped from Blois, and being supported by several nobles, the civil war broke out again; but Armand du Plessis, bishop of Luçon, known afterwards as Cardinal de Richelieu, acted as mediator between the king and his mother, in consequence of which he obtained a cardinal's hat, and in 1624 became minister, and lastly prime-minister, which he continued to be till his death in 1642. Richelieu was certainly one of the greatest ministers of France under the old monarchy; fertile in resources, firm, sagacious, and unscrupulous, he succeeded in humbling and weakening the feudal nobility, and thus paved the way for the absolute government of Louis XIV. He checked the ambition of the house of Austria by assisting, first secretly and afterwards openly, the German Protestant states and the Swedes, by which means France acquired a considerable influence in the affairs of the Empire. In 1628 Richelieu took La Rochelle, the great stronghold of the Protestants of France, which had often withstood the kingly forces under the former reigns. The French armies took an important part in the thirty years' war; they acted on the Rhine in concert with the Swedes, whilst another French army carried on the war in Italy against the Spaniards, a third army was fighting in Flanders, and a fourth on the frontiers of Catalonia. The French were generally successful: they took Roussillon, Alsace, the duchy of Bar, and other provinces. In December, 1642, Richelieu died at Paris, being 58 years of age. His great object had been, during all his ministry, to render the government of the king absolute, and he succeeded. Richelieu at the same time patronized learning and the fine arts; he established the royal press; he embellished Paris; he was magnificent and high-minded; his ambition was not a selfish or a vulgar one. Among his agents and confidants there was a Capuchin, called Father Joseph, whom he employed in the most secret and important affairs, and who seems to have equalled his master in abilities.

Louis survived his minister only a few months; he died in May, 1643, leaving his son Louis XIV. a minor, under the regency of the queen-mother.

(Hénault, *Abrégé de l'Histoire de France*; *Vie du véritable Père Joseph*; Coxe and the other historians of the Thirty Years' War.)

LOUIS XIV. succeeded his father in 1643, being then hardly five years old. His reign, including his minority, lasted seventy-two years, a long and important period, marked by many events and vicissitudes all over Europe, in most of which Louis took an active part. The history of such a reign requires volumes, and has been written or adverted to and commented upon by numerous historians who have treated of that age. But the best works for making us acquainted with the character of Louis and of his government, and the condition of France under his reign, are the contemporary memoirs of St. Simon, Dangeau, Louville, Noailles, Cardinal de Retz, Madame de Motteville, and others, and above all the writings of Louis XIV. himself, especially his *Instructions pour le Dauphin*, which reveal his most secret thoughts. Cardinal Mazarin, an Italian by birth and a pupil of Richelieu, but inferior to his master, was the minister of the regency during the minority of Louis. He continued the war against Spain and the emperor of Germany in conjunction with the Swedes. Turenne, the marshal of Grammont, and the duke of Enghien, afterwards the great Condé, distinguished themselves in those wars. The treaties of Münster and Osnabruck (1648) put an end to the thirty years' war, and Mazarin had the satisfaction of concluding this peace, called that of Westphalia, by which France acquired Alsace, the Sundgau, and the sovereignty of the bishoprics of Metz, Toul, and Verdun. The same year however that the war in Germany was terminated the civil war of La Fronde broke out in France. [FRONDE, LA.] The parliament of Paris and several of the high nobility revolted against the authority of the cardinal. Louis, then ten years of age, the queen regent, and Mazarin, were obliged to leave the capital in January, 1649, and this humiliation seems to have made a deep impression on the mind of Louis, and to have contributed to render him mistrustful, arbitrary, and stern. After some fighting, peace was made, and the court re-entered Paris in the month of August. This was the same year in which Charles I. was beheaded in England and the monarchy abolished. The prince of Condé, who had been the means of appeasing the civil war, having given offence to the queen and the cardinal, was arrested, and Turenne and other Frondeurs began again the civil war in the following year (1650). [CONDÉ, LOUIS DE.] In 1651 the queen ordered the release of Condé; Turenne made his peace with the court, and Mazarin was exiled by a sentence of the parliament of Paris. Condé however continued the war, and being joined by the duke of Orleans, took possession of Paris, which the court had left again. In October, 1652, an arrangement took place, the king re-entered Paris, Condé emigrated to join the Spaniards, the cardinal de Retz, one of the chief actors in the disturbances, was put in prison at Vincennes, and Mazarin himself returned to Paris in February, 1653, and resumed the ministry. In 1654 Louis XIV. made his first campaign in Flanders against the Spaniards. In the following year he concluded a treaty of alliance with Cromwell against Spain. The war continued that and the next year with various success; Turenne commanded the French troops, and the prince of Condé fought on the side of the Spaniards against his own country.

In 1657 the emperor Ferdinand III. died, and Mazarin intrigued to prevent the election of his son Leopold, and to obtain the imperial dignity for Louis XIV. He began by supporting, through his agents at the Diet, the pretensions of the elector of Bavaria, and representing and exaggerating the danger to the liberties of Germany which would attend another election of an Austrian prince to the imperial throne. It was soon found however that the elector of Bavaria was not likely to be nominated, and Mazarin then intrigued separately with the electors in favour of Louis. He bribed, by actual disbursements of money and ample promises of territorial aggrandisement, the archbishops electors of Treves and Cologne, as well as the elector palatine, and even the elector of Brandenburg. Had he succeeded in gaining over the elector of Mayence, John Philip de Schonborn, chancellor of the empire, Louis XIV. would have succeeded. Louis himself repaired to Metz, his army being cantoned in that neighbourhood, as if to support his pretensions. The cardinal sent to the Diet at Frankfort the marshal of Grammont and M. de Lyonne to further his object. In his instructions he empowered them to offer to the elector of Mayence 300,000 livres, besides a revenue of 90,000 more for his relations, and, if necessary, to send at once to Frankfort the value of 1,200,000 livres in plate and other valuable objects as a security. (*Instructions adressées de Stenay, le 29 Juillet, 1657, par Mazarin, à Messrs. de Grammont et de Lyonne*, quoted by Lemontey among the *Pièces Justificatives* of his *Essai sur l'Établissement Monarchique de Louis XIV.*) The elector of Mayence however adjourned the election to the following year, and wrote to Leopold of Austria, king of Hungary and Bohemia, son of Ferdinand, promising him his vote. The other electors kept the money they had received from Mazarin, and turned also in favour of Leopold, who was unanimously elected in 1658. From that time began the bitter animosity of Louis against Leopold, which lasted half a century, and was the cause of three long and bloody wars.

Meantime the war with Spain was brought to a close in November, 1659, by cardinal Mazarin, by the treaty of the Bidassoa, in which the marriage between the Infanta Maria Theresa, daughter of Philip IV. of Spain, and Louis XIV., was concluded. Spain gave up the Artois and Roussillon, and stipulated for a free pardon to the Prince of Condé.

The new queen was married and made her entrance into Paris the following year (1660). She brought with her half a million of crowns as a dowry. She was extremely weak in her intellect and childish in her habits, but harmless and good-natured. Louis XIV. always behaved to her with considerate regard, but never felt any affection towards her, and he resorted to the society of a succession of mistresses, of whom Mademoiselle de la Vallière, Madame de Montespan, and Madame de Maintenon are the most known.

In February, 1661, Mazarin concluded at Vincennes a third and last treaty with Charles, duke of Lorraine, by which Strasburg, Phalsburg, Stenai, and other places were given up to France. Nine days after this treaty Mazarin expired, at fifty-nine years of age, leaving a large fortune to his nieces Mancini, and to his nephew, whom he made duke of Nevers. Mazarin was more successful at the close of his career, in his treaties of peace, than he had been in his wars and former negotiations. The following satirical epitaph, published at the time, expresses the common feeling in that respect:—

> 'Enfin le cardinal a terminé son sort;
> Français, que dirons-nous de ce grand personnage?
> Il a fait la paix, il est mort;
> Il ne pouvoit pour nous rien faire davantage.'

With the death of Cardinal Mazarin began the real emancipation of Louis XIV., who from that moment took the reins of the government entirely into his hands. He dismissed and imprisoned Fouquet, the superintendent or minister of finance, and had him tried on the charges of peculation and treason by an extraordinary commission, which condemned him to banishment; but Louis aggravated the sentence by shutting him up in the castle of Pignerol, in the Alps, where he died in 1680. In appointing Colbert in the room of Fouquet, Louis made a good choice, and much of the splendour of his reign is due to that able minister. [COLBERT, JEAN BAPTISTE.] The ruling principle of Louis XIV. was pure absolutism. The king, according to him, represented the whole nation; all power, all authority, were vested in him. 'L'état, c'est moi!' was his well-known expression. This form of government, he said, was the best suited to the character of the nation, its habits, its tastes, its situation. In his written instructions to the dauphin he tells him that 'all which is found in the extent of our dominions, of whatever nature it be, belongs to us. The monies in our treasury, as well as those which are in charge of the receivers and treasurers, and those which we leave in the hands of our subjects for the purposes of trade, are all alike under our care. You must be convinced that kings are absolute lords, and have the full and entire disposal of all property, whether in the possession of the clergy or of laymen, and may use it at all times as wise economists. Likewise the lives of their subjects are their own property, and they ought to be careful and sparing of them... He who has given kings to men has ordered them to be respected as his lieutenants, reserving to himself alone the right of examining their conduct. It is his will that whoever is born a subject should obey without discrimination or reservation.... The essential defect of the monarchy of England is that the prince cannot raise men or money without the parliament, nor keep the parliament assembled without lessening thereby his own authority.' (*Œuvres de Louis XIV.*, vol. ii., Paris, 1816.)

Louis XIV. completed the work begun by Richelieu: he changed France from a feudal monarchy into an absolute one. Ximenes, Charles V., and Philip II. had effected the same change in Spain; but they had the clergy and the Inquisition to support and share their power, and the absolutism of Spain stood longer than that of France. Louis enticed the high nobility from their rural mansions, attracted them to court, employed them about his person, gave them pensions or placed them in his regular army, and completely broke down their former spirit of independence. With regard to the church, he distributed its temporalities to his favourites, both clerical and lay, bestowed livings and pensions and abbacies in commendam on courtly abbés, and thus rendered the clergy docile and subservient to the crown. He had several disputes with the court of Rome, in which he treated the pope with great asperity; twice he braved the pontiff, through his ambassador, in the middle of Rome [ALEXANDER VII.; INNOCENT XI.]; twice he seized upon Avignon, and twice he obliged the papal court to make him humble apologies. In his old age he became very devout, intolerant, and superstitious, and yet he mistrusted the papal court: 'You know,' he wrote to his ambassador, 'that the court of Rome always seeks for opportunities and pretences to extend its authority; that whatever concession it obtains from other states through the necessities of the times and political expediency it afterwards considers as its own right; and that when at last a king takes up the defence of his own prerogatives, he finds himself involved in much more serious disputes than if he had stood out against encroachment at first.' (*Lettre du Roi au Cardinal d'Estrées*, 27 *Mai*, 1703.)

After the death of Mazarin, Louis admitted no more ecclesiastics into his council. The spirit of jealousy of the Gallican church made it less dependent on Rome and more subservient to the crown; and the hostility of the magistracy against the clergy furnished the king with an arm always ready to check any mutinous disposition in the clerical body. Louis XIV. made the throne support the church, but did not look to the church for a support to the throne. He endeavoured to stop the increase of monks and monasteries, whom he describes, in his 'Instructions pour le Dauphin,' as 'useless to the church and burthensome to the state.'

The parliaments were also subdued, like the nobility and clergy, by the absolute will of Louis. When only seventeen years of age, in 1655, the parliament of Paris having made some remonstrances against an edict of the king concerning the coinage, he rode from Vincennes to Paris, entered the hall of the parliament, booted as he was, holding his whip in his hand, and, addressing the first president, told him that the meetings of that body had produced calamities enough, and that he ordered them to cease discussing his edicts. 'And you, Mr. President,' said he, 'I forbid you to allow it.'

In 1657 Louis issued an edict forbidding the parliament of Paris from making any remonstrances concerning the royal edicts before registering them, and not until eight days after it had obediently registered them, after which the parliament might address him written remonstrances. From that time and to the end of his reign the parliament offered little or no impediment to the royal authority; it withdrew itself from state affairs, and confined itself to its judicial functions.

Having destroyed all opposition from the only orders which enjoyed any consideration in the state, Louis took care to make it known to the tiers état, or commons, that it was not for its advantage that he had humbled the privileged classes. In fact, he did not consider the tiers état as forming a class, but as an ignoble crowd of roturiers who were doomed to work for him and to obey his mandates, and from amongst whom he deigned from time to time to select some individuals as objects of his favour. In his celebrated edict of 1679, concerning duels, he speaks with the most insulting contempt of all persons 'of ignoble birth' who are 'insolent enough' to call out gentlemen to fight; and in case of death or serious wounds resulting therefrom, he sentences them to be strangled and their goods confiscated, and awards the same penalties to those gentlemen who shall presume to fight against 'unworthy persons and for abject causes.' This law, most offensive to the great mass of the French people, was confirmed after Louis's death by the edict of February, 1723, and continued in vigour till the fall of the old monarchy.

Louis established that system of centralization in the administration which has been followed and rendered more complete by the various governments that have succeeded each other till our own days, and which renders France the most compact power in Europe, and in which the action of the executive residing at Paris is felt at every step by every individual in the most remote corners of the kingdom. He at the same time began the first labours for a regular system of legislation, by issuing separate ordonnances for civil and criminal process, for commercial matters, for the woods and forests, and for the marine, and which with all their imperfections formed the basis of distinct codes. The education of Louis had been very imperfect, and he was himself in great measure uninformed; but he encouraged science and literature, for which he was rewarded by numerous flatteries. His reign was a brilliant epoch of learning in France. With regard to the arts, he had more pomp than taste; he felt a pride in conquering obstacles, as the millions he lavished on Versailles, in a most unfavourable locality, amply testify.

Louis XIV. hated the Protestants, not so much from religious bigotry as because he considered them as rebellious subjects; he wanted uniformity in everything, in religion as well as politics. This led him to that most unjust and disastrous measure, the revocation of the edict of Nantes, in [illegible], by which Protestantism was proscribed in France. France lost thousands of its most industrious citizens, who repaired to England, Switzerland, Holland and Germany, carrying with them their manufacturing skill, and all the efforts of Colbert to encourage French industry were rendered abortive by that cruel and fanatical act, of which the revolt of the Cévennes and the war of extermination which followed were remote consequences. The persecution of the Jansenists was another consequence of Louis's intolerance.

The foreign wars of Louis XIV. proceeded in great measure from the same ruling principles or prejudices of his mind. He disliked the Dutch, whom he considered as mercantile plebeians, heretics, and republicans, 'a body formed of too many heads, which cannot be warmed by the fire of noble passions' (*Instructions pour le Dauphin*,' vol. ii., p. 201); and he carried his antipathy to the grave without having succeeded in subjecting that small nation, whose wealth excited enemies against him everywhere. It is impossible not to be struck with the similarity of prejudices in two men, however dissimilar in some respects, Napoleon and Louis XIV. The hatred of Napoleon against England, which he designated as a nation of shop-keepers, was like that of Louis against the Dutch, and it produced similar results to his empire. The same determination of establishing uniformity in everything; the same mania for a unity and singleness of power, which both mistook for strength; the same ambition of making France the ruling nation of Europe under an absolute ruler, were alike the dominant principles, or rather passions, of the 'legitimate and most Christian king,' and of the plebeian 'child and champion of the Revolution.' Several of the plans and schemes of Louis XIV., relative to foreign conquests, were found in the archives and were revived and acted upon by Buonaparte.

The first war of Louis XIV. against the emperor Leopold, Holland, and Spain, was ended by the treaty of Nymegen, 1679. Louis kept the Franche Comté and part of the Spanish Netherlands. The war broke out again in 1688, between Louis on one side, and the Empire, Holland, and England on the other. Louis undertook to support James II. in Ireland, but the battle of the Boyne and the capitulation of Limerick put an end to the hopes of the Stuarts, and James II. passed the rest of his life in exile at St. Germain-en-Laye, where he died a pensioner of the French king. In Germany Louis XIV. caused one of the most atrocious acts recorded in the history of modern warfare. This was no less than the devastation of the Palatinate by his commanders. A district of more than thirty English miles in length, with the towns of Heidelberg, Manheim, Speyer, Oppenheim, Creutznach, Frankenthal, Ingelheim, Bacharach, Sinzheim, and others, was ravaged, plundered, and burnt, in cold blood, under the pretence of forming a barrier between the French army and its enemies. A cry of indignation resounded throughout all Europe at the disastrous news. It was just about this time that James Stuart solicited, from his exile at St. Germain, the assistance of the emperor against William of Orange, in the name of legitimacy and the Catholic religion. Leopold in his answer observed, 'that there are no people who injure so much the cause of religion as the French themselves, who on one side support the Turks the enemies of all Christendom, to the detriment of the Empire; and on the other, have ravaged and burnt innocent towns, which had surrendered by capitulations signed by the hand of the Dauphin: they have burnt the palaces of princes, plundered the churches, carried away the inhabitants as slaves, and treated Catholics with a cruelty of which the Turks themselves would be ashamed.' (*Letter from the Emperor Leopold to James II., 9th April, 1689, in the Mémoires de Jacques II., vol. iv.*) In 1693 the unfortunate town of Heidelberg, which had been partly restored by the inhabitants, was taken again by the French marshal De Lorges, the women were violated, the churches set on fire, and the inhabitants in general, 15,000 in number, stripped of everything and driven away from their homes. On these news a 'Te Deum' was sung at Paris, and a coin struck, which represented the town in flames, with the inscription, '*Rex dixit et factum est!*' The treaty of Ryswick, in 1697, terminated the war, by which Louis gained nothing, acknowledged William III. as king of Great Britain, and restored the duke of Lorraine to his dominions.

The third war of Louis was that of the Spanish succession. It began in 1701 and lasted 12 years, convulsed all Europe, and was terminated at last by the peace of Utrecht in 1713. Louis succeeded in establishing a Bourbon dynasty in Spain, but this was the only advantage he gained; his armies had been repeatedly defeated by Eugene and Marlborough, his best generals were dead, his treasury was exhausted, his subjects were tired of war and of taxes, and he himself was broken down in health and spirits, a mere shadow of what he had been. He lingered about two years more, during which he legitimated his numerous natural children; made his will, by which he appointed his nephew, Philip Duke of Orleans, regent during the minority of his great-grandson and heir Louis XV.; fell ill in August, 1715, and died the 1st of the following September, 77 years of age.

After divesting the character of Louis XIV. of the exaggerated praise heaped on him by flattery or national vanity, after animadverting upon his numerous faults, and even crimes, it must be fairly acknowledged that he was a remarkable prince, and had many valuable qualities. He was active, intelligent, and regular in business; quick in discovering the abilities of others, an able administrator himself, endowed with a constant equanimity in adversity as well as prosperity, and a perfect self-command; a kind master, he was not prone to change his servants capriciously, was not harsh in rebuking them, and was ever ready to encourage merit and praise and reward zeal for his service. Hence he had many faithful and devoted servants. His presence was noble and his appearance imposing; he acted the king, but he acted it admirably, at least in the then taste of the people; he had a lively sense of decorum and outward propriety which never forsook him. What he knew he learnt by himself; his natural gifts and the experience of his youth, passed among civil wars, made up for his want of learning and of study. If he carried his notions of absolutism to an extreme, he was evidently persuaded of his supposed right, and acted as much from a sense of duty as from inclination. In his reign of seventy-two years he raised the fabric of the absolute monarchy in France, which continued for seventy-two years more after his death; and when it was shaken to pieces in the storms of the Revolution, still the ruling principles of his administration, uniformity and centralisation, survived the wreck, and France is still governed by them.

Louis XIV. raised the revenue of France to 750 millions of livres, or about 30 millions sterling, an enormous sum considering the then poverty of the country. The taille, or direct tax, was very unequally assessed. The evils of the system of taxation under his reign are exhibited in a book, printed in 1694, called 'A Compendious History of the Taxes in France.' Louis spent 2000 millions of livres for his two last wars, that which ended by the peace of Ryswick, and the war of the Spanish succession, and he left at his death a debt of more than two thousand millions. He set up the fatal example of those enormous permanent armies which the other powers of Europe were obliged to imitate in their own defence, and thus gave that mistaken impulse towards making France a nation of soldiers, which has been the occasion of much mischief ever since. (*Mémoires Complets et Authentiques du Duc de St. Simon sur le Siècle de Louis XIV.*, 21 vols. 8vo, Paris, 1829-30; Lemontey, *Essai sur l'Établissement monarchique de Louis XIV., et sur les Altérations qu'il éprouva pendant la Vie de ce Prince*, forming the 5th vol. of the 'Œuvres de P. E. Lemontey,' Paris, 1829; Hénault, *Abrégé Chronologique de l'Histoire de France*; Voltaire, *Siècle de Louis XIV.*; and the other French historians.)

LOUIS XV., born 15 February, 1710, was the only surviving son of the duke de Bourgogne, eldest son of Louis the Dauphin, son of Louis XIV. The Dauphin died in 1711; and his son the duke of Bourgogne died in 1712. The younger brother of the duke of Bourgogne was Philip, duke of Anjou, afterwards Philip V. of Spain, who, except his nephew Louis XV., was the only legitimate descendant of Louis XIV. who survived that king. The mother of Louis XV. was Maria Adelaide of Savoy, who died in 1712. Philippe d'Orléans, son of Philippe de France, brother of Louis XIV., and the head of the actual Orléans branch of the Bourbons, was appointed regent. Louis XIV. had by his will appointed a council of regency, at the head of which was the duke of Orleans, but the parliament of Paris acknowledged the duke as sole regent. In gratitude the Regent issued, on the 15th September, a declaration, in the name of the king, restoring to the parliament the right of making remonstrances on the royal edicts, letters patent, and declarations, before it registered them.

The duke of Orleans had acquired an unfavourable reputation as a man of licentious habits, and as destitute of religious and moral principles. This corruption was partly ascribed to the Abbé Dubois, an unprincipled man, who had been his preceptor, continued to be his favourite, and was afterwards his minister. Vicious as the duke was, he was accused of crimes of which he was guiltless. The sudden death of the children and grandchildren of Louis XIV., at short intervals from each other, had given rise to horrible suspicions, which have been since generally rejected. The 'Mémoires de St. Simon,' already quoted, which include the period of the regency, contain the most correct sketch of the character of the duke of Orleans, a character not rightly understood till the publication of that work.

The Regent began well: he reformed several of the most outrageous abuses of the late reign, he liberated a number of individuals who had been for years immured in the Bastille; he enforced economy, reduced the army, supported the general peace of Europe, courted the friendship of England, concluded the triple alliance of the Hague in 1717, between France, England, and Holland, and gave up altogether the cause of the Pretender. Unfortunately for himself and for France, the disorder in which he found the finances, and the fearful deficiency in the revenue, made him listen to the wild schemes of Law, which ended in disappointment and the ruin of thousands of families. [LAW, JOHN.]

Philip V. of Spain, or rather his minister Alberoni, be-encouraged a conspiracy against the duke of Orleans, the object of which was to excite a revolution against him, to deprive him of the regency by a resolution of the three estates of the kingdom, and to place Philip himself at the head of the regency. The plot was discovered, several of the leaders, who were chiefly in Britanny, were punished by death, and in 1719 the Regent declared war against Spain. The war however did not last long, Alberoni was dismissed and banished by his sovereign, and Philip of Spain made peace with France in 1720. [ALBERONI.] In 1722 Dubois, who had been made a cardinal, became prime minister of France.

In February, 1723, Louis XV., having completed his fourteenth year, was declared of age, and the regency of the duke of Orleans terminated. The same year Dubois died, and was followed to the grave by the duke of Orleans a few months after. The duke de Bourbon Condé was made prime minister, and governed France until 1726. It was proposed to marry Louis XV. to Mademoiselle de Sens, the duke's sister, who was a rare instance of virtue, beauty, and modesty united, in those times, but she refused, and preferred a life of retirement to a throne. Louis married, in 1725, Maria Leczinska, daughter of Stanislaus, ex-king of Poland, and in the following year the duke of Bourbon was dismissed from the ministry, and the Abbé de Fleury, the king's preceptor, and afterwards cardinal, was substituted for him. The seventeen years of Fleury's administration, which ended with his death in 1743, were the best period of the reign of Louis. [FLEURY, ANDRE HERCULES.] Fleury restored order in the finances, and credit and commerce revived. In 1733 the war of the Polish succession broke out, by the death of king Augustus II., when Louis XV. took the part of his father-in-law Stanislaus, the old rival of Augustus, against Austria and Russia, who supported the son of Augustus. [AUGUSTUS III.]

The war was carried on between France and Austria both on the Rhine and in Italy. In the latter country the French, being joined by the Spaniards and the king of Sardinia, obtained great success. Don Carlos, son of Philip V., conquered the kingdom of Naples and Sicily, and thus a third Bourbon dynasty was founded in Europe. Peace was made in 1736, by which the duchy of Lorraine was given to Stanislaus for his life, to be united after his death to the crown of France. Francis, duke of Lorraine, had Tuscany in exchange. In 1741 the war of the Austrian successor broke out, in which France took part, against the advice of Fleury, who was overruled by the king and the courtiers. In 1743 Fleury died, and Louis declared that he would govern by himself, and without any prime minister. The war continued till 1748, when it was terminated by the treaty of Aix-la-Chapelle. France derived no advantage from this murderous and expensive war, and Maria Theresa remained in possession of her father's dominions. Louis XV. was present at the battle of Fontenoi, in May, 1745, between the English, commanded by the Duke of Cumberland, and the French, commanded by Marshal de Saxe, in which both armies fought with the greatest obstinacy and suffered most severely; the French however claimed the victory.

In 1755 hostilities were begun by the English against the French in America, in consequence of disputes concerning the boundary-line between Canada and the English settlements. In the following year war was formally declared between the two powers. This war connected itself with the war in Europe called the Seven Years' War. The English were the allies of Frederick of Prussia, whilst the French joined the empress Maria Theresa. This war proved most unfortunate to France. The French were beaten at Rosbach by Frederick, in 1757, and were defeated again at Minden by the Duke Ferdinand of Brunswick, with the loss of 8000 men, cannon, baggage, military chests, &c. In America they lost Canada. A project of invasion of England by means of six thousand flat-bottomed boats, by which landings were to be effected on various points of the coast was revealed to the English ministry by an Irishman called Macallister, and was abandoned. At last by the peace of Paris, February, 1763, France formally ceded Canada, Nova Scotia, and its other North American colonies, besides Granada, Dominica, and Tobago in the West Indies; its navy never after recovered from its losses, its finances were exhausted, and its commerce destroyed. This was the last war of Louis XV., a war which was undertaken rashly and terminated in a disastrous and humiliating manner. The feeling of dis[illegible] resulting from it sunk deeply into the heart of a people so vain and sensitive as the French, and it completely did away with the former popularity of Louis, which had once obtained him the title of 'Bienaimé,' or beloved. The king had now abandoned himself to gross licentiousness, and had become careless of state affairs. The mad attempt of Damiens made him still more alienated from his people. [DAMIENS.] After the death of his mistress, the Marchioness of Pompadour, an ambitious intriguing woman, but who had still some elevation of mind, he became attached to more vulgar women [BARRY, MARIE JEANNE], and at last formed a regular harem after the fashion of the Eastern sultans, but more odious from its contrast with European manners, which was called the Parc aux Cerfs, and upon which vast sums were squandered. The minister of foreign affairs, Choiseul, who had remonstrated with the king upon his degradation, was dismissed in 1770. He was the last man of some merit who served Louis XV. [CHOISEUL, ETIENNE FRANÇOIS, DUC DE.] The state of the finances was the most obvious difficulty of ministers, to whose remonstrances, urged sometimes in a tone of appalling and ominous seriousness, Louis used to answer, 'Try to make things go on as long as I am to live; after my death it will be as it may.'

Louis died at Versailles, on the 10th May, 1774, 64 years of age. Two sons whom he had had by his wife were long dead: the eldest, the Dauphin, died in 1765, and left by his wife, a Saxon princess, three sons, who have been in succession kings of France, namely, Louis XVI., Louis XVIII., and Charles X. Louis XV. had also by his wife several daughters, besides illegitimate children.

It was under Louis XV. that the corruption of morals and principles spread in France to an alarming extent among all classes, being encouraged by the materialism and sensual philosophy which were taught by several men of letters. Both these causes, added to the general poverty, national humiliation, and ruined finances, prepared the way for the explosion which took place under his unfortunate successor. (Lacretelle; Fantin des Odoards; Voltaire, *Vie Privée de Louis XV.*)

LOUIS XVI., grandson of Louis XV., succeeded him in 1774, being then twenty years of age. He had married in 1770 Marie Antoinette, archduchess of Austria, sister of Joseph II. He chose for his minister of finance Turgot, an honest and enlightened man, who, in concert with his colleague Malesherbes, perceiving the temper of the times, wished the king to take the reform into his own hands, by abolishing the corvées and other feudal exactions, equalizing the direct taxes all over the kingdom, granting liberty of conscience and recalling the Protestants, reforming the criminal code, compiling a uniform civil code, giving freedom of trade, rendering the civil power independent of the ecclesiastical jurisdiction, suppressing the greater part of the convents, and establishing a new system of public instruction. These were the real wants of France; if these could have been satisfied, the revolution would have become unnecessary. But the clergy and the nobility strongly opposed these projects, the parliaments themselves were averse to changes which would reduce their own importance, and the old count de Maurepas, who was also one of the cabinet, dissuaded the young king from them. Turgot was dismissed. Louis however, following his own natural disposition, effected much partial good; he abolished the corvées and the practice of torture, granted liberty of trade in corn in the interior of the kingdom between one province and another, made many reforms in the administration, established a system of economy and order, and gave the first example of it himself in his own household. He also granted toleration to the Protestants. But all these were little more than palliatives, and did not strike at the root of existing evils. The deficiency in the treasury, and the debt of four thousand millions of livres left by Louis XV., were the great stumbling-block of Louis's administration. He however went on for some years, during which he engaged in a war against England, which was very popular with the French, humbled as they had been in the preceding struggle with that power. The object of this war was a singular one for an absolute monarchy to embark in; it was in support of the revolted colonies of North America, which had declared their independence of Great Britain, and it has been since considered by many as a political blunder on the part of the French monarch. On the 6th February, 1778, a treaty of commerce and alliance was signed at Paris between the French cabinet and Franklin and Silas Deane on behalf of the United States, by which the latter were acknowledged by France as an independent community. In the following May a French fleet under count d'Estaing sailed for America, in June the first hostilities took place at sea, and on the 10th July France declared war against England, and 40,000 men were assembled in Normandy for the invasion of England. This plan however was not carried into effect, because the French and Spanish fleets, which were to protect the landing, were dispersed by contrary winds. In America the French auxiliary troops, joined to the Americans, were successful against the English. [FAYETTE, LA.] At sea many engagements took place between the French and English, both in the Atlantic and the Indian seas, without any very decisive advantage on either side; but on the 12th April, 1782, the French Admiral De Grasse was completely defeated by Admiral Rodney off the island of Dominica, with the loss of five ships of the line, and was taken prisoner. In September of the same year the attack of the French and Spaniards upon Gibraltar failed. [ARÇON.] In September, 1783, peace was concluded at Versailles; England acknowledged the independence of the United States, and gave up to France Tobago and the coast of Senegal.

Meantime the financial embarrassment of the French government went on increasing. Necker, a Genevese banker, wealthy and retired from business, having become minister of finance in 1776, made many reforms, effected a new and more equitable assessment of the direct taxes, established provincial assemblies of notables, who apportioned the taxes, and put an end to the enormous gains of the fermiers-généraux. [FARMERS-GENERAL.] After five years of war his 'compte rendu' showed a surplus of ten millions of livres; he had borrowed 530 millions at a less interest than had ever been known in times of war; the discount on exchequer-bills, which had been sixteen per cent., was reduced to eight, and all this without any addition to the burthens of the people.

In November, 1783, by a court cabal Necker was dismissed, and Calonne, a more pliant and courtly person, was substituted. He managed to go on a little longer, involved himself in a dispute with the parliament of Paris, and at last, being unable to proceed any further, he proposed to the king to call together an assembly of the notables selected by the king from the various provinces, to consult upon the means of supplying the deficiency in the revenue, which Calonne stated to amount to 110 millions of livres. This assembly met at Versailles in February, 1787, rejected Calonne's proposal of laying additional taxes upon property (the notables themselves were all landed proprietors), and proposed instead several measures, among others a loan on life annuities, and the formation of a council of finance. The king adopted their measures, and then dissolved the assembly. A paper-war now took place between Necker and Calonne on the respective merits of their administrations, and Calonne, being detected by the king in a falsehood, was dismissed. Several successive ministers followed for short periods, but they could do nothing to retrieve the ruinous state of affairs, and at last Necker was recalled. He stated to the king that the only resource left was to call together the tates-general of the kingdom, which had not been assembled since 1614. The king convoked them at Versailles in May, 1789. These states had always consisted of the three rders, clergy, nobility, and the third estate, or commons. Every order formed a separate house, in which it discussed he measures proposed by the government, and decided by a majority of votes. By this means any project of law displeasing to the two privileged orders was sure not to pass hose two houses, and was therefore lost. Necker, to obviate this difficulty, proposed to give to the third estate a double vote, so as to balance the votes of the other two houses. The king, after some hesitation, gave this double vote to the third estate, and this was in fact the beginning of the Revolution. It is remarkable that Monsieur, the king's brother, afterwards Louis XVIII., was one of those who supported this organic change.

On the 5th of May, the three estates having assembled in he common-hall, the king opened the session by a temperate peech, which was much applauded, after which the clergy and nobility withdrew to their separate rooms to deliberate among themselves. The third estate remained in the common-hall, and in the following sittings proposed that the hree orders should assemble and deliberate together, which he other two refused. On the 10th the third estate elected Bailly for their president; and on the following day they were joined by several deputies of the clergy. On the 17th, on the motion of the abbé Siéyes, the third estate, joined by many of the clergy, constituted themselves as a national assembly, and resolved that as soon as that assembly should be prorogued or dissolved, all taxes not sanctioned by it should cease to be legal. The court was alarmed at these innovations, and the king announced that he was going to hold a royal sitting. Meantime the doors of the hall of the assembly were closed, and a guard placed there to prevent the deputies from entering. Bailly led them, on the 20th, to the 'Jeu de paume,' where they swore not to separate until they had framed and enforced a new constitution for the kingdom, and the redress of existing grievances. On the 23rd the king convoked the three estates in the common-hall, and after qualifying the resolutions of the 17th preceding as illegal, ordered the estates to leave the hall, and withdraw each to their appropriate chamber, to deliberate there upon certain subjects which he laid before them. After the king's departure, the third estate, joined by part of the clergy, refused to leave the hall, and when the grand-master of the ceremonies came to enforce the king's order, Mirabeau answered him, that they were there to fulfil their duty towards their constituents, and that force alone should disperse them. On the 25th, part of the deputies of the nobility joined the third estate, and the name of national assembly was publicly recognised. The events that followed rapidly are too numerous and too generally known to be inserted in this article. The national assembly, by the constitution it formed, changed the old French monarchy into a representative republic, with a single chamber, and an hereditary magistrate, with the name of king, whose power however was rendered insignificant and nugatory. They suppressed not only the feudal jurisdictions, but also the manorial dues and fees; the titles of nobility; the tithes, convents, and the corporations of trades; they confiscated the property of the church; they abolished the old division of the kingdom by provinces, and ordered a new one by departments: they changed entirely the social relations of the country, so that even Mirabeau was startled at the rapidity with which they were legislating, and began to express ominous doubts of the result. (Dumont, *Souvenirs de Mirabeau.*) 'It is easy to destroy,' he said, 'but we want men able to reconstruct.' Paine's pamphlet on the supposed 'Rights of Man' was gravely assumed by that assembly as the basis of their political theory. Meantime insurrections broke out in Paris and in the provinces: not only the abominable Bastille was taken and destroyed, July, 1789, but the châteaux, or manorial residences of the nobility, all about the country, were attacked and burnt, with many acts of atrocity. On the 6th October the palace of Versailles was entered by a mob from Paris, the body-guards were murdered, the royal family were in great danger, and at last the king consented to remove to Paris, whither he was escorted by the armed populace. On the same day the famous club of the Jacobins began its meetings at Paris. [JACOBINS.] The emigration of the nobles had already begun: several members of the royal family repaired to Germany and Italy. The year 1790 was passed amidst alarms and insurrections in the interior, and rumours of foreign war, amidst which the assembly continued its labours for the new organization of France. It passed a law requiring of all the clergy the oath of fidelity to the new constitution: the pope forbade the oath as schismatic, and many of the French clergy refused to take it, but they were dismissed from their functions and replaced by others more docile, who however had not the confidence of the more religious among their flocks. Thus religious schism was added to civil feuds. The king himself was obliged to send away his chaplains. He had by this time become weary of being a mere puppet in the hands of the assembly, which had despoiled him of almost every royal prerogative, even of the right of pardoning; the 'veto,' or power of suspending for a time the passing of an obnoxious law, had also become illusory, for whenever he attempted to exercise it, an insurrection broke out, which, by frightening the court, obliged the king to submit.

In June, 1791, Louis, with his consort, his sister, and his children, endeavoured to escape from France, but was stopped at Varennes, and brought back to Paris. In the following September the assembly, having completed the new constitution for France, presented it to Louis, who, after making some remarks on what he conceived to be its deficiencies, swore to observe it. This act acquired him a few moments' popularity; and the assembly, having stated that the object for which it had met was completed, closed its sittings on the 30th September. The assembly consisted of 1118 members, of whom 272 were barristers and solicitors, 90 were judges and other magistrates, 208 belonged to the parochial clergy, 241 were gentlemen of noble birth, 48 archbishops and bishops, 35 abbots and canons, 176 merchants and landed proprietors, and the rest physicians and men of other professions. If that assembly committed errors, they were errors of judgment, for the majority were certainly sincere in wishing to maintain the kingly office, which they thought compatible with democratic institutions. Through a mistaken delicacy however they committed a very serious blunder before they parted; for they resolved that no member of that assembly should be eligible to the next assembly of the representatives of the nation, which became known by the name of the legislative assembly, and which was composed of much worse materials. The majority in the legislative assembly were men hostile to the monarchical principle altogether; they were divided between Girondins and Jacobins. [Girondins.] They began by sequestrating the property of the emigrants; they issued intolerant decrees against the priests who would not swear to the constitution, and by these means obliged them to run away from France; they treated the king with marked disrespect, dismissed his guards, provoked the war against Austria and Prussia, encouraged republican manifestations in various parts of the country, and even in the army, established extraordinary courts to judge the emigrants and other people disaffected to the new order of things (the word 'incivisme' was invented to designate this new offence), and issued an enormous quantity of paper money, which quickly becoming depreciated, added to the general misery. [Assignats.]

The king endeavoured, by the use of his 'veto,' to check this headlong career. An insurrection in June, 1792, was the consequence; the palace of the Tuileries was assailed and entered by the mob, which treated the royal family with the greatest insolence, threatened their lives, and obliged the king to put on a red cap and show himself at the window to the crowds below. A second insurrection, better organized, with the avowed object of abolishing the kingly office, was supported by a party in the legislative assembly. The mob again attacked the Tuileries on the 10th of August, and after a desperate defence by the Swiss guards, entered it and massacred all the inmates. The king and royal family had time to escape and take refuge in the hall of the legislative assembly. The assembly deposed the king, sent him and his family prisoners to the Temple, proclaimed a republic, and convoked a national convention to exercise the sovereignty in the name of the people. In September the massacres of the political prisoners began; the cry of 'aristocrat' became a sentence of death against any obnoxious person. On the 21st September the national convention opened its session, and shortly after prepared to bring the king to trial. The principal heads of accusation were, his attempt to dissolve the states-general in 1789, his escape to Varennes, and other acts previous to his accepting the constitution of 1791. Since his acceptance of it there was no charge that could be substantiated against him, except the exercise of the prerogatives given to him by the constitution, such as the 'veto,' and changing his ministers. The rest were mere insinuations and surmises of having bribed deputies, corresponded with the hostile powers, &c. The trial was opened in December. The Girondins and the Jacobins united against Louis, and he was found guilty of 'treason and conspiring against the nation.' The sentence was pronounced on the 16th January, 1793. Of 721 members present who voted in the convention, 366 voted for death unconditionally, 288 voted for imprisonment and banishment, and the rest voted for death, but with a respite, hoping thereby to save his life. The majority which sent Louis to the scaffold was only five.

On the 21st January, 1793, Louis XVI. was taken in a coach to the Place Louis XV., where the guillotine was fixed. He appeared silent and resigned, and engrossed by religious thoughts. Having ascended the scaffold, he attempted to address the people, but Berruyer, the commander of the national guards, ordered the drums to beat. Louis then gave up the attempt, took off his coat and cravat, and laid his head on the block. He was beheaded at ten o'clock in the morning. His consort Marie Antoinette was tried, condemned, and beheaded in the following October. The character of that unfortunate princess has been rescued from unmerited obloquy and the malignity of her enemies by Madame Campan in her 'Mémoires sur la Vie privée de Marie Antoinette,' London, 1823. Louis left one son, styled Louis XVII., and one daughter, who married her cousin the duke of Angoulême.

(*Nouvelle Continuation de l'Abrégé Chronologique de l'Histoire de France* par le Président Hénault, vols. v. and vi., Paris, 1822.)

LOUIS XVII., duc de Normandie, second son of Louis XVI., styled Dauphin after his elder brother's death in 1789, remained in prison in the Temple after the death of his parents, and there he died of disease in consequence of ill treatment and privation, on the 9th of June, 1795. He was then ten years of age. He had been styled Louis XVII. by the royalists after his father's death.

LOUIS XVIII., Stanislas Xavier, count of Provence, born in 1755, was also styled 'Monsieur' during the life of his brother Louis XVI., who, just before his death, wrote to him, appointing him regent of France. After the death of his nephew, Louis XVII., in 1795, he assumed the title of king of France and of Navarre, although he was then an exile, and he was acknowledged as king by the Royalist emigrants, who composed a small court around his person. He had shown his liberal disposition in favour of rational reforms in France in the first period of the Revolution, but the violence of the Jacobins obliged him to emigrate in 1791. He lived for some time at Verona, in the Venetian territories, which he was obliged to quit when Bonaparte invaded Italy in 1796. He resided successively in various parts of Germany, and at last settled at Warsaw, but in 1803 removed to Mittau in Courland, under the protection of Russia. By the peace of Tilsit, 1807, he was obliged to leave the Continent, and he repaired to England, where he fixed his residence at Hartwell in Buckinghamshire till 1814, when events in France opened the way for his return to the throne of his ancestors. He landed at Calais in April of that year, and proceeded to St. Ouen, from whence he issued a proclamation acknowledging himself as a constitutional, and not an absolute king; promising the speedy publication of a charter, a total oblivion of all the past, and guaranteeing all the possessors of what was called national property. On the 4th of June he laid before both the senate and legislative body a charter which he had drawn up with the assistance of his ministers, and which was unanimously accepted, and became the fundamental law of the kingdom, and such it remains to this day, with a few alterations introduced in [illegible]

Louis was sincere in his professions, but he was surrounded by disappointed emigrants and old royalists, whose imprudence injured him in the public opinion; whilst on the other side he had against him the Bonapartists, a formidable body, including the greater part of the army. A conspiracy was hatched against Louis, Bonaparte returned from Elba, and Louis, forsaken by all, retired to Ghent. [Bonaparte, Napoleon.] The battle of Waterloo, June, 1815, opened again to Louis the way to Paris; but this time he appeared as an insulted and betrayed monarch. Those officers who, in spite of their oaths to Louis, had barefacedly favoured Bonaparte's usurpation, were tried and found guilty of treason: some were shot, and others exiled. The new Chamber of Deputies, which was elected under the excitement of this second restoration, proved ultra-royalist in principle, and went further than the sovereign. They banished all those who had voted in the convention for the death of Louis XVI., as well as those who had accepted office under Napoleon after his return from Elba. Meantime sanguinary reactions took place in various parts of France, especially in the south, where the old animosity of the Catholics against the Protestants was revived by political feuds. At last Louis himself saw the danger to which the violence of his pretended friends exposed him, and he dissolved the chamber, which was styled 'La Chambre Introuvable.' In the new elections the moderate constitutional party regained the ascendancy, and the king in 1818, appointed a liberal ministry, at the head of whom was Count Decazes. But the assassination of his nephew the Duke of Berry, by a fanatical republican, in February, 1820, again alarmed the court, and restored the influence of the ultra-royalists. Decazes was dismissed, and Villèle was placed at the head of the ministry. The law of election was altered, the newspapers were placed under a censorship, and other measures of a retrograde nature were adopted. No open violation of the constitution however was committed. In 1823 Louis, in concert with the Northern powers, sent an army into Spain under his nephew the duke of Angoulême, to rescue Ferdinand from his state of thraldom. [FERDINAND VII.] The expedition was successful; it restored Ferdinand to the plenitude of his power; but it did not succeed in restoring to Spain order and good government. In September, 1824, Louis XVIII. died, having been a long time ill and unable to walk: he retained to the last his mental faculties and his self-possession. He left no issue, and was succeeded by his brother Charles X. Louis had a cultivated mind, considerable abilities, and a pleasing address: his ideas were enlightened and liberal, and in ordinary and settled times he would have proved an excellent constitutional king; as it was, he managed to steer tolerably well between extreme opposite parties, and in a most critical period. He published, in 1823, the account of his emigration, 'Relation d'un Voyage de Paris à Bruxelles et Coblenz,' which is curious. (See also *Mémoires de Louis XVIII., par le Duc D.*' an assumed title, Paris, 1832.

LOUIS, or LOUIS D'OR, a gold coin in the old system of France, first struck under Louis XIII., in 1641. Kelly says, 'the Louis d'ors coined before 1726, which passed then for 20 livres, were coined at the rate of $36\frac{1}{4}$ per French mark of gold, 22 carats fine; the remedy in the weight was 14 grains per mark, and the remedy in the alloy one-fourth of a carat. These ceased to be a legal coin in France as far back as 1726; but they still continued to circulate through many parts of Germany and Switzerland, where they had a fixed value, and were known by the name of "the old Louis d'ors;" they are mentioned under that name in all the editions of Kruse, Ricard, and in other books on exchange printed before 1786.' 'From the year 1726 till 1785 Louis d'ors were coined at the rate of 30 to the mark of gold 22 carats fine, and with a remedy of 15 grains in the weight, and $\frac{12}{32}$ of a carat in the alloy; thus at least $30\frac{130}{1331}$ pieces were coined from a mark $21\frac{20}{32}$ carats fine. These ceased to be current in France in 1786.' 'In Holland, Germany, &c., they were called "new Louis d'ors," to distinguish them from those last mentioned.' 'In 1785 and 1786 all the gold coins in France were ordered to be brought to the mint to be melted down; and a new coinage then took place at the rate of 32 Louis d'ors to the mark, of the same degree of fineness, with the same allowances for remedy as above; thus at least $32\frac{139}{1331}$ pieces were coined from a mark of gold $21\frac{20}{32}$ carats fine. The intrinsic value of this new Louis d'or (allowance being made for the remedy) was 18*s.* $9\frac{1}{4}$*d.* sterling; and 1*l.* sterling = 25 livres 10 sous Tournois in gold.' Louis d'ors were considered as a current coin in most parts of the Continent; though in England they were sold only as merchandise, where at different periods, according to the demand, their price fluctuated from 18*s.* 6*d.* to 21*s.* sterling. Upon the return of the Bourbon family, the twenty-franc pieces struck by Louis XVIII., in imitation of the Napoleons, received the name of Louis, or Louis d'or; a designation which is likewise given occasionally to the same coin struck by King Louis Philippe, but which are more ordinarily called twenty-franc pieces.

The old Ecus, coined before 1726, were called LOUIS-BLANCS, and LOUIS D'ARGENT.

(Furetière, *Dict. Universelle;* Kelly's *Universal Cambist*, edit. 1811, vol. i., pp. 146, 147; ii., 202.)

LOUIS, ST. [MISSOURI.]

LOUISBOURG. [CAPE BRETON.]

LOUISIADE ISLANDS is the name of an extensive group of islands situated in the Pacific, south-east of the great island of Papua, or New Guinea, between 8° and 12° S. lat. and 150° and 155° E. long. It is generally supposed that this group was discovered by Bougainville in 1768, but it is more probable that Torres found these islands in 1600, after having traversed the strait between Australia and New Guinea, which still bears his name.

Few islands of the Pacific have been less visited by European vessels than New Guinea and Louisiade, and our information respecting them is accordingly extremely scanty. We do not even know the number of the islands which belong to the last-mentioned group, but it is certain that they are very numerous. They occupy a space of more than 300 miles from north-west to south-east, but none of them appear to be large. So far as a rough conjecture may be formed, there is not one that exceeds forty miles in length. Some of them rise to a considerable elevation; they generally appear to be very fertile. The inhabitants belong to the race of the warlike Papuas, and are very averse to any intercourse with foreign vessels which visit the dangerous sea that washes the southern coast of these islands. It is supposed that they are cannibals. The inhabitants make large pirogues, or canoes, and use shields as a defensive armour.

(Bougainville, *Voyage round the World;* D'Entrecasteaux, *Voyage round the World.*)

LOUISIANA, the most south-western of the United States of North America, comprehends the countries on both sides of the Mississippi between 28° 56′ and 33° N. lat., and 88° 50′ and 94° 30′ W. long. The Gulf of Mexico washes its shores on the south for about 400 miles. The Sabine river separates it on the west from the Mexican province of Texas. This river constitutes the western boundary-line for 200 miles; the remainder of the line, about 69 miles, runs along the meridian of 94° 30′ to 33° N. lat. On the north the parallel of 33° N. lat. constitutes the boundary-line between Louisiana and Arkansas for 172 miles. Between 33° and 31° N. lat. the Mississippi separates Louisiana from the state of Mississippi, the course of the river between these parallels being 235 miles. The remainder of the boundary between these states lies along 31° N. lat., between the Mississippi and Pearl rivers, and then along the last-mentioned river to its mouth; the former distance is 106 and the latter 60 miles. The area of Louisiana is calculated at 48,220 square miles, or only about 2000 miles less than that of England.

Surface and Soil.—Louisiana presents a great variety of surface, though it is a plain country, and only in a very few places rises into hills of moderate elevation. But the plains are on different levels, a circumstance which causes a great variety in soil, climate, and agriculture, and gives to the different regions entirely different features.

The delta of the Mississippi extends along the shores of the Gulf of Mexico from Atchafalaya Bay on the west (91° 40′ W. long.) to the Pass de Marianne (89° 15′ W. long.) and Lake Borgne on the east, and comprehends a coast-line of above 250 miles. From Lake Borgne its boundary runs westward through the lakes Pontchartrain and Maurepas, and then along the Amite and Iberville to the place where the last-mentioned river, or rather channel, leaves the Mississippi. It then follows the course of the Mississippi to the great bend above the mouth of the Homochitto river, about 31° 15′ N. lat. Hence it crosses the Mississippi westward, and continues along the course of Red River to the neighbourhood of the rapids. At this place begins the western boundary of the delta, which follows the course of the Bayou Bœuf up to its union with Bayou Crocodile. Farther south the river Teche up to its influx into the Atchafalaya branch of the Mississippi may be considered as the boundary-line, and afterwards the Atchafalaya to its mouth in Atchafalaya Bay. The whole country contained by these boundary-lines, and comprehending about one-fourth of the state, or more than 10,000 square miles, is for six months of the year either covered with water or a swamp. The swamps extend along the sea, and are called the marshes; the inundated region lies north and west of the marshes.

The marshes are nearly on a level with the sea at high tide. They are destitute of trees and shrubs, but covered with grass, which however is quite useless, as the swamps can only be traversed in boats by following the numerous watercourses which intersect them. Between the mouth of the Atchafalaya and La Fourche branches of the Mississippi the marshes extend only about twenty miles inland, and terminate on the southern border of the elevated tract called Terre Bonne, the only part of the delta which exhibits any considerable extent of surface not subject to inundation: the larger portion of the Terre Bonne is a prairie. Between La Fourche Bayou and the Mississippi the marshes extend much farther inland to the shores of Quacha or Barataria, and the great bend of the Mississippi south-east of New Orleans. East of the Mississippi only a small tract south of Lake Borgne is not marshy; but along Lake Pontchartrain the marsh does not occupy much more than the peninsula which separates Lake Borgne from Lake Pontchartrain. The cultivated part of this marshy region is confined to the very narrow banks of the watercourses, and even there settlements are only formed on the northern borders of the marshes, on account of the great unhealthiness of this region.

The inundated region comprehends more than two-thirds of the delta. It may be divided into two portions, the deeply inundated, and the less deeply inundated tract. All that part of the delta which is west of the Mississippi and of the Bayou la Fourche, with the exception of a tract west of Baton Rouge, is deeply inundated from February to August; during which period it forms an immense lake. Not even the banks of the Atchafalaya are free from inundation. The common depth of the water is six feet, but in many parts, especially where the Red River joins the Mississippi, it is much more. During the remainder of the year it is dry and the soil firm. The whole region is covered with high and thick forest-trees, but no settlements have been formed in this country. It may be compared with the immense inundated plains on the southern banks of the Amazon river.

The country east of the Mississippi and of the Bayou la Fourche, as well as the tract of higher ground west of Baton Rouge, is only inundated to the depth of three or four feet, and the inundation ceases a month or six weeks sooner. The banks of the rivers also are several feet higher than in the country farther back, so that they are at most only slightly inundated. The greatest part of this country is almost covered with trees, but there are also tracts without wood. As the more elevated banks of the rivers extend in width from a quarter of a mile to a mile, numerous settlements have been formed on them. The most valuable are those along the Bayou la Fourche and the Mississippi Proper. On the former they begin at twenty miles from the sea, and on the latter at Fort St. Philip, about 50 miles from the mouth of the river. To protect the cultivated ground from the annual inundation, a bank of earth called levee has been formed on each side of the Mississippi. It begins at Fort St. Philip ([illegible] N. lat.), and extends to the higher grounds of Baton Rouge ([illegible]), a distance of [illegible] miles. In some places above New Orleans this embankment is fifteen feet high and thirty wide at the base, but generally it does not exceed twelve feet at the base and five in height.

If we compare the delta of the Mississippi with that of the Ganges, the marshes correspond to the Sunderbunds, except that they are not covered with trees. The inundated portion of the American delta has however this disadvantage, that its waters do not run off in a straight course, but are deflected by the high grounds along the prairies of Opelousas and Attakapas, and farther on by the high land of the Terre Bonne. This circumstance retards their efflux, which is still further retarded by the extremely small slope of the inundated tract. The tide of the Mexican Gulf, though it does not rise above three feet, unless it is impelled by southerly winds, ascends the Atchafalaya to the influx of the Courtableau, a distance of more than 100 miles. Thus the water becomes nearly stagnant in the greater part of the inundated country, and produces many dangerous diseases. This circumstance, added to the difference of climate, renders it very doubtful if the delta of the Mississippi ever can acquire a population and a degree of cultivation approaching that of Bengal.

The country west of the delta to the Sabine river is likewise bordered by a broad belt of marshes along the sea. They extend hardly ten miles inland along Cote Blanche Bay and Vermilion Bay, but from 20 to 30 miles inland west of Vermilion Bay. These marshes however are not quite destitute of trees: several clumps of live oak occur in them, especially on both sides of Mermentou river. North of the marshes the country rises considerably, and extends in open prairies, which are generally destitute of trees, but covered with grass. The prairies are traversed by numerous rivers, whose narrow bottoms are overgrown with trees, and contain fertile tracts. A few settlements have been made on these bottoms, but the prairies themselves are almost entirely inhabited by the tribes of the Attakapas and Opelousas, the Bayou Queste Tortue constituting the boundary between these tribes. The prairie of the Attakapas extends in a narrow strip south-eastward between the marshes along Vermilion and Cote Blanche Bay and the river Teche. The banks of the last-mentioned river form the western boundary of the inundated country, but they are above the line of the inundation, and contain many rich cultivated tracts. To the west and north-west of the prairies of Opelousas lies an extensive wooded region, which on the Sabine extends to 30° 10′, and terminates not far from the marshes. It occupies the country about the northern half of the course

u river, and approaches the inundated country on the Bayou Bœuf, a branch on the Courtableau. The whole of this extensive tract is covered with pine-forests, and the soil is of very indifferent quality. It is an undulating plain, except at the most north-western angle of Louisiana, between the upper course of the Sabine river and the Red river, where it rises into high hills.

Red River may be considered as the boundary of this wooded region. Where it enters Louisiana, high grounds covered with pine-trees approach to the margin of the river on both sides, but about 50 miles lower down a remarkable depression of the surface extends from north-north-west to south-south-east, and is about 60 miles long with a mean width of eight miles. It terminates at Grand Ecor, 4 miles above Natchitoches. On entering this low tract the river divides into numerous branches, presenting a most intricate mass of islands, inlets, channels, and lakes, of every size from one to thirty miles in length. Lake Bistineau is 40 miles long and from one to three wide, and Lake Bodcau 30 miles long and from one to ten wide. The whole of this low region is inundated from one to twenty feet during the months of February, March, and April, but in summer the lakes and low grounds are nearly dry, and in October and November they become meadows covered with a carpet of green and succulent herbage. There are yet no settlements in this country, though it seems better adapted to them than the lower part of the delta. Below Grand Ecor the inundation of Red River appears not to extend beyond its bottom, which is rather wide, and the higher grounds which skirt it as far as the rapids near Alexandria have rather a fertile soil: numerous settlements have been formed below Natchitoches.

The country extending from Red River on the west to the Mississippi river on the east consists mostly of elevated woodland, especially that portion which lies west of the Washita or Ouachita river. In this region, east of Lake Bistineau, is the highest land of Louisiana. It consists of numerous hills rising from 100 to 200 feet above their base: they are covered with trees, chiefly pine and oak, thinly interspersed with ash, hickory, and dog-wood, and produce a luxuriant herbage in summer and spring. Farther east these hills sink into a plain, which extends to the Washita and river Bœuf, a confluent of the former. This plain is nearly a level, has a sandy soil, and is mostly covered with pine-forests; but the river bottoms are wide, and have a fertile soil. The settlements are still few, and do not extend beyond the bottoms. Where however the rivers Washita and Bœuf approach one another, an extensive tract of fertile land occurs, on which the settlements increase rapidly. The country on both sides of the Black River, which is formed by the junction of the river Bœuf with the Washita, resembles in every respect the less inundated part of the delta. But between the river Bœuf and the Mississippi, and especially along the banks of the latter, is a low tract traversed by the river Tensas, a confluent of Black River, which is likewise inundated by the water which issues from the Mississippi in the first half of the year. Narrow strips along the river become quite dry in the second half of the year, but the greater part of this tract is a swamp, which produces fine timber-trees, especially cypress. From these forests New Orleans is supplied with lumber and fuel.

Along the east bank of the Mississippi extends an elevated country, broken by numerous streams. Its projections, worn away by the action of the river, are known by the name of Bluffs. They rise more than 100 feet above the alluvial plains near the Mississippi. These hills continue eastward for 15 or 20 miles from the banks, and lie scattered about in wild confusion. They are overgrown by mingled forests of oak, sweet gum, poplar, tulip-tree, hickory, and some pine, and have an almost uniformly productive soil. By degrees the hills disappear, and are followed by a plain which is considerably elevated above the delta. This plain has a sandy sterile soil, and is entirely overgrown by pitch-pine. On the south it does not extend to the lakes of Maurepas and Pontchartrain, but begins imperceptibly to lower, at a distance of about ten miles, until it advances to the river Amite and the lakes, where it terminates in narrow swamps, which line the banks of the river and lakes. On this declivity of the more elevated plain the number of settlements is greater than in any other part of Louisiana of equal extent. The soil, though light, is well adapted to the cultivation of cotton, and the extensive pine-forests produce abundance of pitch and tar.

Rivers and Lakes.—The Mississippi enters Louisiana at its most north-eastern corner, 33° N. lat., but receives no accession of water from the right until it has attained 31° N. lat., where it is joined by the united waters of Red and Black rivers, which together probably drain a tract of 100,000 square miles, and bring down an immense body of water during the spring months. A mile and a half below the mouth of Red River the Mississippi sends off its first great branch, the Atchafalaya, which, flowing in a southern and south-eastern direction, traverses the lowest part of the delta, enters the south-western part of lake Chetimaches, and issuing from it, passes through the marshes into Atchafalaya Bay. [ATCHAFALAYA.] Lake Chetimaches, or Grand Lake, is about 40 miles long and from two to five wide; at its southern extremity it is 40 feet deep. It is connected with the Atchafalaya by several natural channels, which traverse the intervening country, and divide it into many islands, making a kind of net-work.

From the Atchafalaya the Mississippi flows in a general south-eastern direction, but with many great bends. About 30° 20′ N. lat. the river sends off the second great branch, the Iberville, which runs eastward, and joins the Amite river. The united stream, preserving the latter name, falls into Lake Maurepas, a circular sheet of water about 8 miles in diameter. This lake is united to the lake of Pontchartrain by the Pass of Manchac. Lake Pontchartrain is in the form of an ellipse 40 miles by 32, and from 18 to 20 feet deep. This lake is connected with Lake Borgne by two channels, of which the southern is called Chef Menteur, and the northern the Rigolets. Lake Borgne, though denominated a lake, is really a bay of the Gulf of Mexico, and connected with it by the Pass de Marianne. The Iberville river, before its union with the Amite, has but three feet water, and that only during three months of the highest overflow. A few miles below the efflux of the Iberville, the Mississippi sends off another branch to the west, the Plaquemines, which is only six miles long, and joins the Atchafalaya. Though it has only water during the high flood, it is important for the internal navigation. Farther down occurs the last great efflux of the Mississippi, the La Fourche (the Fork). It leaves the principal river at Donaldsonville, and flows in a south-eastern direction for 90 miles; it has 9 feet water on its bar, and admits vessels drawing 4 or 5 feet to within 30 miles of its efflux; but the upper part of its course is very shallow from September to March. From the efflux of the La Fourche the Mississippi flows east to the town of New Orleans, and thence to the sea in a south-eastern direction. Shortly before it reaches the Gulf of Mexico it divides into six branches, called the West, South-west, South, East, North-east, and L'Outre Pass. The most frequented is the East Pass, with 12 feet water at ordinary tides; the South-west Pass is nearly as deep as the East Pass. The other passes have from 3 to 6 feet water, but they are rarely frequented. The depth of the water increases rapidly in the channels, so that it is upwards of 30 feet within a mile from the bars, and still greater farther upwards. For farther particulars see MISSISSIPPI. In the inundated tract there is a great number of lakes of different sizes. The largest is lake Quacha or Barataria, south-south-west of New Orleans, which is 22 miles long and six wide. As these lakes are united, either with one another or with the chief branches of the Mississippi, some of them facilitate the internal navigation, especially Lake Palourde and Lake Verret, which are united with one another and with the Atchafalaya and La Fourche, branches of the Mississippi.

Red River, which rises in the Rocky Mountains, traverses Louisiana with a general south-east course of 200 miles, but by the windings of the river of above 300 miles. The navigation is interrupted only by the rapids in 31° 20′ N. lat., where two ledges of rocks extend across the channel about three-quarters of a mile from each other; but when the river water is high the rocks form no obstruction to the passage of boats. In the low country above Natchitoches, where the river divides into many branches, the navigation is intricate and troublesome.

The other rivers of Louisiana are unimportant as channels of navigation. The Sabine, which divides the country from Texas, rises in the last-mentioned country. Its general course is nearly south, with an elliptical curve to the east; it flows upwards of 200 miles. Before it enters the sea it flows into a shallow lake 30 miles in length, and from three to five wide. In ordinary tides there is not above three feet water on its bar. East of the Sabine is the Calcasiu, which rises in the angle between the Red River and Sabine, flows parallel to the last-mentioned river at a distance of about 35 miles, expands near its mouth likewise into a large but shallow lake, and has also only three feet water on its bar. Its course is upwards of 200 miles. The Mermentou, which flows to the east of the Calcasiu, is properly only the channel by which Lake Mermentou discharges its waters into the Gulf of Mexico. This lake is of considerable extent, and receives most of the waters which originate on the prairies of Opelousas, but the different streams unite before they enter the marshes in one river, which receives the name of Mermentou, and soon afterwards falls into the lake. It is not better adapted for navigation than the Sabine and Calcasiu. Sixty miles east of the mouth of the Mermentou are two large bays, Vermillion Bay and Cote Blanche Bay, which are united by several passes with the Gulf of Mexico. The bays have twelve feet of water, but the passes only five or six feet. Vermillion Bay receives the river of the same name, which rises on the prairies of Opelousas, 30° 30′ N. lat., and runs in a general southern course about 90 miles. It is navigable for vessels of five feet draught to a considerable distance.

Climate.—The opinion of Valney, that the countries along the Mississippi have a much milder climate than those along the Atlantic, is now known to be incorrect. On the contrary, it has been proved by many observations that the mean temperature of the latter, under the same parallel, is from two to three degrees higher than that of places west of the Appalachian Mountains. It is found that the seasons are milder at Charleston, South Carolina, 32° 42′ N. lat., than at New Orleans, in 30° N. lat. A considerable difference is observed between the climate of the low and high lands of Louisiana. In the low lands it seldom snows, and frost is not frequent, but in the winter of 1814 the ponds and lagoons near New Orleans were frozen so as to admit half-grown boys to skate or play on the ice. (Darby.) This extreme cold however is a rare occurrence, the thermometer commonly not sinking to the freezing-point. In summer the heat is great, and lasts from the beginning of July to the close of September; the thermometer then ranges between 75° and 85°, and sometimes rises to 90° and even 96°. At this time the inundation ceases, and the decomposition of animal and vegetable matter infects the air, and produces dangerous diseases, especially fevers. The mean temperature of the year at New Orleans, according to Darby, does not exceed 62°, or about 13° above that of London, which is 21 degrees nearer the pole. On the higher grounds, especially on the open prairies of Opelousas, the climate is much more severe. In 30° 30′ N. lat. the snow has fallen to a depth of 11 inches, and remained for several days on the ground. It seems that frost occurs there every winter, and even sometimes in April and September, so that at Natchitoches it does great injury to the cotton and tender plants. In July there are heavy rains and thunder, and in August sometimes hurricanes blow from the south, which cause great damage by forcing the water of the Mississippi into the adjacent level country. In winter the north-western gales, which are very cold, produce great and sudden changes in the temperature.

Productions.—The species of grain chiefly cultivated for food are rice and Indian corn. The rice forms an article of export. Wheat, rye, barley, and oats are more cultivated towards the north than in the southern districts, but nowhere to any great extent.

Sugar succeeds very well south of 31°; farther north its cultivation is less advantageous and more expensive, as the plants are destroyed by the cold, and must annually be replaced. Cotton, which is the staple article, succeeds everywhere, and is of excellent quality. Good tobacco is raised in different places, but its cultivation is on the decrease. The mulberry-tree is indigenous. The cultivation of indigo, which was formerly carried on to some extent, has generally given way to that of cotton. Vegetables are not extensively cultivated, with the exception of the sweet potatoe. The orange-tree and the purple fig do not succeed farther than 30° N. lat. The pomegranate-tree, the peach, and vine, succeed wherever they are cultivated, but the apple only in the northern districts.

By far the greatest part of the surface of Louisiana is covered with forests. The pine-tree, which is most abundant, covers the northern and western sandy districts, and is extensively used in the manufacture of tar and pitch. On the declivities by which the prairies or wooded regions descend to the inundated grounds, the forests mostly consist of oak, sweet-gum, poplar, tulip-tree, and hickory, of various species; the same trees occur on the broken country east of the Mississippi: the chincapin grows on the borders of the inundated lands.

Immense herds of cattle are raised on the natural meadows of Opelousas and Attakapas, as likewise horses and mules. The bison or buffalo is at present only met with towards the northern and western border, especially between the Sabine and Red River, where also wild horses are found. Deer is only plentiful in the prairies of Opelousas and in the pine-forests. Bears, lynxes, the American panther, and beavers are rare, but wolves are numerous. Locusts infest the prairies, and numerous serpents the woods and lowlands. The alligator occurs in all the rivers, but is most numerous in the bays and lakes of stagnant water: it is not dangerous, except when attacked or wounded. The Mississippi and its branches abound in fish. The forests swarm with birds, among which are the wild turkey, the paroquet, the pelican, the flamingo, and the humming-bird. Swans, geese, and ducks are very numerous on the lakes and stagnant waters along Red River.

Clay occurs in the alluvial soil of the delta, at a depth of from ten to thirty feet along the Mississippi. There are salt springs in the northern districts, on the high grounds from the Mississippi to Sabine river, and several of them are turned to advantage. Coal exists in the same places, and iron-ore is found in the north-western corner, between the Sabine and Red River.

Inhabitants.—The inhabitants of European and African origin amounted in 1820 to 153,407 individuals, of whom 73,867 were whites, 10,476 free coloured persons, and 60,064 slaves. A considerable part of the population are the descendants of French settlers; and some newspapers were a few years ago, and probably still are, printed both in the French and English languages. According to the census of 1830 the number of free people was 106,130, and that of the slaves 109,630. The great increase of the slave population is to be ascribed to the increased culvation of cotton and sugar.

The native tribes are not comprehended in this census; but their number probably does not exceed a thousand individuals. On the prairies are the Attakapas and Opelousas, but these tribes are far from being numerous; they have no fixed habitations, and live mostly from the produce of the chase. The Chocktaws, on the Washita and Red River, are more numerous. They have adopted agriculture, and their villages are not much inferior to those of the other inhabitants; they chiefly cultivate Indian corn and the sweet-potatoe. The Tensas, between Bœuf and Tensas river, towards the northern boundary of Louisiana, are few in number.

Political Geography.—For political and civil purposes Louisiana is divided into thirty-one parishes. The present capital and seat of government is the town of Donaldsonville, situated at the efflux of the La Fourche branch from the Mississippi: it has much increased since the seat of government was removed to it. The largest town of Louisiana, and one of the most commercial towns of the United States, is New Orleans [Orleans, New], on the left bank of the Mississippi, 105 miles above its mouth. All the other places are inconsiderable. Baton Rouge, on the Mississippi, contains only 1200 inhabitants; and Alexandria, on the Red River, hardly more. Natchitoches, on the last-named river, has not 2000 inhabitants: it is at the head of the steam-boat navigation on Red River, and the centre of the trade to Mexico.

The United States granted to Louisiana 46,000 acres of land for the endowment of a college, and 873,000 acres for the support of schools: the State annually appropriates about 40,000 dollars for the support of parish schools. The college of Louisiana, which has an annual allowance of 7000 dollars from the state, is at Jackson; and a college has been incorporated at Opelousas.

Commerce.—Besides the valuable produce of its own soil, the productions of all the states and settlements within the extensive basin of the Mississippi river which are destined for a foreign market must pass through this state, because all the branches by which the river enters the sea are within its boundaries. As to this commerce see Orleans, New. The internal communication between the dispersed settlements and New Orleans is entirely carried on by water, as there is no carriage-road in Louisiana, with the exception of that which runs along the Mississippi on the Levée. Boats from 15 to 60 tons are conveyed from New Orleans by the Plaquemine into the Atchafalaya. Those destined for the lower part of Attakapas descend the latter river and enter their points of destination by the Teche. Those bound to the central parts of Attakapas descend the Atchafalaya about 20 miles, and are thence transported by an outlet and Lake Chetimaches to the Fausse Point landing. Here is a portage of 10 or 12 miles to S. Martinsville, the seat of justice for the parish of S. Martin's or Upper Attakapas. Vessels for the higher or central parts of Opelousas ascend the Atchafalaya to the mouth of the Courtableau, and thence by the latter stream to Larrell's Landing, six miles, or into Bayou Carron, four miles from the village of S. Landré. (Darby.) The settlements on the Lower Teche communicate with Donaldsonville and New Orleans by the lakes of Palourde and Verret, and by the inlets which connect these lakes with the Atchafalaya and La Fourche branches of the Mississippi.

History.—The Mississippi river was discovered by land. The Spaniards navigated the Gulf of Mexico for two centuries without being aware that one of the largest rivers of the globe falls into it. This fact may be explained from the circumstance that a low, flat, and dangerous coast extends on both sides of its mouth to a great distance. The French, after their establishment in Canada, got some information as to this river about 1660, but did not find its mouth before 1699, when M. de Iberville founded the first colony. The city of New Orleans was built in 1717, about which time the colony began to be of some importance. The French remained in possession of Louisiana up to 1763, when they ceded it to Spain. The colony was much neglected by the Spaniards, and improved very slowly, notwithstanding its numerous natural advantages. In 1800 the Spanish government re-ceded Louisiana to France, but the French government fearing that Louisiana would be taken from them, during the war that followed the peace of Amiens, by the superior naval force of England, sold it to the United States in 1803 for 15,000,000 dollars. At the time of the sale the inhabitants were chiefly French and descendants of French, with a few Spanish creoles, Americans, English, and Germans: the whole population did not exceed 90,000 inhabitants, of whom about 40,000 were slaves.

Louisiana comprehended all the country included in the present state of Louisiana, with the exception of that tract which extends on the northern shores of the river Amite, and the lakes of Maurepas and Pontchartrain, and in addition, the immense tract of country included between the Mississippi river and the Rocky Mountains. The country was then divided into several territories, of which Louisiana first rose to a state. In 1811 its population had increased to the number required by the federal constitution, and Louisiana was formed into a state in 1812. The legislative authority is vested in a house of representatives and a senate. The members of both houses are elected by all free white male citizens who have attained the age of twenty-one years. The senate consists of seventeen members, elected for four years; the number of representatives is at present fifty members, who are elected for two years. The executive power is vested in a governor. Louisiana sends two senators and three representatives to Congress.

At the time of the union of Louisiana with the United States, the civil laws of Spain, and also the Roman law to some extent, were in force. Some changes were immediately introduced for the purpose of bringing the condition of its inhabitants nearer to that of the other United States. Accordingly juries and the Habeas Corpus were introduced; but the antient laws still remained in force. Their defects were however so evident, that the legislature formed a new civil code, which was published in 1824. At the same time Mr. Edward Livingston was entrusted with the preparation of a new penal code, of which the first project was published in 1824, and the code itself was promulged in 1833.

LOUISVILLE. [Kentucky.]

LOULE', a town of Algarve, in a broad and fertile valley, 8 miles north of Faro, which is on the sea-coast. [Algarve.] It contains 1600 houses and about 8000 inhabitants, several churches and monasteries, one of which is for poor ladies of good families, in which they manufacture very neat baskets with the fibres of the aloe (*Agave Americana*), prepared and dyed for the purpose, and which are sent all over Portugal, as well as artificial flowers and other similar articles. The town of Loulé is surrounded by walls and has a garrison: its territory is very fertile and well watered, and produces corn, wine, oil, and fruits. A number of fine carob-trees grow in the neighbourhood. Loulé has the title of a Marquisate, which is borne by the representative of a Portuguese family, allied by marriage to the present royal family. (Miñano; Link.)

LOURDES. [PYRENEES SUPERIEURES.]

LOUSE. [PEDICULUS.]

LOUTH, a maritime county of the province of Leinster in Ireland; bounded on the north by the county of Armagh and Bay of Carlingford, which separates it from the county of Down; on the east by the Irish Channel; on the south and south-west by the county of Meath; and on the west by the county of Monaghan. According to the map of Ireland published under the superintendence of the Society for the Diffusion of Useful Knowledge it lies between 53° 43′ and 54° 7′ N. lat., and between 6° 6′ and 6° 41′ W. long. According to the map of the Ordnance Survey of Ireland it extends from the Mattock river on the south to the Armagh boundary on the north, 25 statute miles; and from Dunany Point on the east to the Meath boundary on the west, 15 statute miles. From the sea at the bridge of Dundalk, however, to the Monaghan boundary, its breadth is only 6¼ miles. The surface, according to the latter map, consists of

		Acres.	r.	p.
Land	. .	202,336	2	36
Water	. .	813	0	4
Total	. .	203,149	3	0

or 317½ square statute miles, being the smallest county in Ireland. In 1831 the gross population was 107,486.

From the Boyne to the river of Dundalk, comprising more than three-fourths of the county, the surface is of the same character with that of the great central plain of Ireland, of which it forms the north-eastern portion. The only eminences in this division at all conspicuous are in the southern part of the county, which they cross in a direction nearly east and west, forming a continuation of the hilly group which occupies the north-eastern angle of the county of Meath. The highest ground here is Belpatrick, near the county boundary, 789 feet. East from Belpatrick rises the round-backed hill of Collon, or Mount Oriel, wooded to the top, and forming a striking object for a distance of several miles in all directions. Near this is the very handsome though small town of Collon, adjoining the extensive demesne of Oriel Temple, the residence of Lord Ferrard. From Collon a low hilly range extends eastward, attaining its highest elevation in the hill of Tullyesker, 616 feet, and terminating in the promontory of Clogher-head, which rises 181 feet above the Irish Channel. The heights belonging to this range are cultivated to the top, and present no abrupt or striking outlines. Between them and the Boyne the country, except along the immediate valley of the river, possesses few features of interest. Near the coast, about midway between the Boyne and Clogher-head, is the village of Termonfeckin, situated on a stream running eastward from Tullyesker to the sea.

On the other side the Mattock river, rising between Tullyesker and Collon, runs southward by Mellifont to the Boyne, forming the boundary between Louth and Meath. The northern slope of the hilly range above mentioned spreads into an open gently undulating plain, almost wholly under tillage, which extends without any remarkable eminence as far as the river of Dundalk. This level district is crossed from west to east by various streams, which, uniting as they approach the sea-coast, form three moderately sized rivers; the Dee, the Glyde, and the Fane. The Dee rises in the north-east of Meath, and passing through the town of Ardee, which is, next to Dundalk, the most considerable place in the county, proceeds in a direction nearly from west to east until within four miles of the sea, where it receives the White river, running north-eastward past Dunleer, which direction the united stream preserves through the remainder of its course. The Glyde, formed by the junction of the Lagan, which rises in Meath, with a stream descending from the Monaghan border, passes for the first five miles of its course through a bare and uninteresting tract bordering on the latter county. Eastward from this the appearance of the country rapidly improves; a series of demesnes, of which Louth Hall, the seat of the earl of Louth, is the most extensive, occupies both banks of the river for several miles of its course through the rich tract north of Ardee: the remainder of its progress to Castlebellingham, a remarkably pretty village on the great northern road leading from Drogheda to Dundalk, is through low marshy meadow lands. At Castlebellingham it turns southward, and winding through a well-improved tract bordering on the coast, meets the Dee, with which it has a common embouchure at Anagassan. The course of the Fane is nearly parallel to that of the Glyde, and the character of the country through which it runs is similar, the more highly improved portion being towards the coast, where for two miles of its course it skirts the demesne of Clermont, and then enters the sea at the village of Lurgangreen. A dead flat, beginning south of Lurgangreen, continues to Dundalk, the county town, which stands on the extreme verge of the plain, at the head of a creek formed by the embouchure of the Castletown river. The surrounding country is in a high state of cultivation: the level lands towards the sea, in particular, are laid out with great regularity and on an extended scale.

Beyond the Castletown river, which runs out of the county of Armagh in a direction from north of west to south of east, the surface is of quite a different character. A group of mountains, ranging from 1000 to 1900 feet in height, and extending over a district fifteen miles long and five miles broad, stretches across the Armagh border, and extends eastward into a great peninsula forming the northern boundary of the Bay of Dundalk and the southern limit of the Lough of Carlingford and basin of the Newry river.

The general direction of these mountains is from north-west to south-east: the group is divided into two nearly equal portions by a ravine traversing it from north to south, and forming a direct line of communication between Dundalk and Newry. Through this defile the great northern road is carried at a considerable height above the bed of a mountain-stream, which has been taken advantage of in the formation of a pretty sheet of water in the demesne of Ravensdale, a romantic seat of the late Sir Harry Godericke. The steep declivity of the mountain, which rises about 1500 feet above the level of the glen in which the mountain stands, is clothed with wood to a height of several hundred feet; and this hanging screen of foliage is prolonged on the south by a succession of similar plantations extending as far as the bay of Dundalk. A remarkable wooded eminence, called Trumpet-hill, rising between the main mountain-range and the shore, forms a prominent feature in this scene, which, to the traveller approaching Dundalk from the north, is one of peculiar variety and grandeur: this effect is considerably heightened by the bleakness and monotony of the boggy tract of Killeavy, through which the road passes for several miles before entering the defile. The mountains lying to the west of this ravine are situated chiefly in the county of Armagh, and consist of the Slieve Gullion and Forkhill groups. The latter lie immediately along the boundary of Louth, and are distinguished by the extreme ruggedness of their outline, a feature more or less characteristic of all the heights of the range. The Kilcurry river, descending from the southern declivities, joins the Castletown river a short distance above the bridge of Dundalk. The glens and vales which lie along this border of the mountain-region possess much picturesque beauty. On the eastern side of the pass of Ravensdale the chief heights are Clermont, 1462 feet; Clermont Cairn, 1674 feet; and Dorlargy, 906 feet. Trumpet-hill rises 465 feet, but from its extreme steepness appears to be much higher. From the eastern side of Ravensdale the mountains stretch back to the river of Newry and bay of Carlingford, which they overhang in masses rising almost immediately from the water's edge. The chief heights here are Corrakite, 1869 feet, and Carlingford mountain, immediately over the town of Carlingford, 1935 feet. Towards the extremity of the peninsula and along that side bounding the bay of Dundalk the mountains leave a considerable margin of level land between them and the sea. This open tract is several miles in width at the extremity of the peninsula, where it terminates in the low point of Ballagan, forming the southern boundary of the bay of Carlingford. A considerable valley, watered by two streams called the Big and Little Rivers, penetrates the mountain-region on this side, running up between the heights of Barnavave, 1142 feet, on the east, and Slieve Nagloch, 1024 feet, on the west. On the north the plain is contracted to a narrow strip along the shore of Carlingford Loch and valley of the Newry river by the mountain-group above mentioned. The town of Carlingford, a place of considerable antiquity and historical interest, stands at one extremity of this tract, and the castle of Narrow-water at the other. The latter however, being built on the opposite side of the river of Newry, is in the county of Down. The harbour of Carlingford is described under the article DOWN. The only other harbour, with the exception of a shallow creek at Anagassan, and a small fishing-pier at Clogher-head, is that of Dundalk. Clogher-head is the only bold feature of the coast between Dundalk and the mouth of the Boyne. A broad sandy beach, in some places extending at low-water to a distance of two miles, skirts this part of the coast at every other point. The danger of these great sandy shoals is however much diminished by the prevalent direction of the wind, which for nine months of the year is off shore.

Geology.—The level portion of the county south of the river of Dundalk belongs generally to the extensive clay-slate formation, which follows the northern margin of the limestone plain from the Irish channel on the east to the verge of the Upper Shannon on the west. One considerable patch of carboniferous limestone, skirted with a narrow belt of yellow sandstone and conglomerate, is included within the county boundary to the west of Ardee, and minor deposits of the same rock occur in several other localities through the west and north-west of the southern division; but the greatest extent of this formation within the county is in the district north of Dundalk, where the level space between the declivities of the mountains and the shore, from the town of Carlingford to the bridge of Dundalk, and thence westward on both sides of the Castletown river to its junction with the Kilcurry, is occupied by a limestone formation, which, as it is surrounded on the landward side by transition and primitive rocks, may probably be in connection with that part of the great central field which is known to be overlaid by the waters of the Irish Channel farther south. The structure of the mountainous region is similar to that of the group of Mourne, consisting of a nucleus of granite supporting the clay-slate and limestone of the surrounding field on its flanks; the clay-slate near the line of contact being altered, and passing into greenstone slate. A great protrusion of crystalline greenstone trap occurs at the eastern extremity of the range, constituting the central mass of the mountains between the Big River and Carlingford. On the northern declivities of these heights the clay-slate re-appears, skirting the southern shore of the bay of Carlingford. Iron and lead ore are the only minerals which have been observed, but nowhere in sufficient quantity to warrant mining operations.

Soil, &c.—The soil of the southern division of the county, although not so rich as that of the limestone plain of Meath, is well calculated for every kind of grain-crop. Wheat is grown in large quantities in the district round Ardee; oats and barley are the chief crops raised off the tillage lands of the rest of the southern district. The tract north of the bay of Dundalk, between the mountains and the sea, also produces heavy wheat crops. Farming in general is carried on in a superior manner. Green crops are grown by almost all the gentlemen farmers. The fences are usually of quickset, and the lands well drained. In the mountain-district the condition of the people is much inferior, and the improved system of husbandry unknown. Spade-cultivation is here very general, and the old slide car without wheels is still in use. The dwellings and appearance of the peasantry inhabiting the dreary tract through which the northern road passes before entering the defile of Ravensdale contrast strongly with the comfortable habitations and decent dresses of the rural population of Down. The condition of the peasantry throughout the southern district is however considerably better in all respects than in most of the counties of Leinster. The rate of wages for agricultural labourers varies from 8*d.* to 10*d.* per day, for 210 working days in the year.

There is no regular return of the sales of grain in the several market-towns. The sales in Dundalk in 1835 were—

Wheat	242,100 cwts.
Barley	377,074 „
Oats	146,037½ „

The sale of oats at Ardee in the same year is estimated at 73,400 cwts., and at Castlebellingham 3500 cwts. The wheat and barley of the above return are chiefly the produce of Louth and Monaghan; the oats, of Cavan, Monaghan, and Fermanagh. The greater part of the oats produced in Louth is used for home consumption.

The linen manufacture is carried on with some activity at Ravensdale and Collon, where there are large bleach-greens, but chiefly in Drogheda and its neighbourhood, where the trade is generally very brisk. In Drogheda there is a steam-power mill for spinning flax, which employs 450 spinners. The quantity of linen made in the town is 1500 webs weekly, six-sevenths of which are manufactured from yarns spun in the town and neighbourhood, or imported from Belfast, and the remainder of British yarns. The number of persons employed in the linen manufacture in the county in 1831 was as follows: bleachers, 20; flax-dressers, 6; reed-makers, 2; weavers (including some woollen weavers) 972. In the same year there were in the county 6 brewers, 7 maltsters, 30 tanners, 64 coopers, 14 corn-dealers, 60 millers, and 15 millwrights. A pin manufactory was established at Drogheda, in 1836, by a Manchester house, who were unable to procure a sufficient number of hands at their English establishment. The hands employed are children, who earn about 4*s.* per week. In 1838 there were 260 employed, and the proprietors were looking out for the site of another establishment in a populous part of the county. The fisheries off the coast give occasional employment to 13 decked fishing-boats, 11 half-decked ditto, one open sail ditto, and 313 open sail-boats, having an aggregate tonnage of 1765 tons, and manned by 1315 fishermen.

There is a rather numerous resident gentry. The only nobleman permanently resident is Lord Viscount Ferrard. The Earl of Roden has a mansion and fine park adjoining Dundalk, but is usually resident in the county of Down. The other principal proprietors are Sir Patrick Bellew, Sir Allan Bellingham, Sir Richard Robinson, and the families of Fortescue, Balfour, Taaffe, Chester, &c.

Divisions, Towns, &c.—Louth is divided into the baronies of *Lower Dundalk*, on the north-east, containing the town of Carlingford, population (in 1831) 1319; *Upper Dundalk*, on the north-west, containing the town of Dundalk (pop. of borough and town 13,078); *Louth*, in the centre, containing the town of Louth (pop. 613); *Ardee* on the south-west and centre, containing the towns of Ardee (pop. 3975) and Castlebellingham (pop. 611), and the village of Anagassan (pop. 235); and *Ferrard*, in the south, containing the towns of Collon (pop. 1153), Dunleer (pop. 710), and Clogher (pop. 592), and the villages of Termonfeckin (pop. 470) and Baltray (pop. 428).

Dundalk, the assize town of the county, has had various charters of incorporation. The governing charter bears date the 4th March, 1674. The corporation consists of a bailiff, 16 burgesses, and an indefinite number of freemen. The governing body is the corporation at large. The freedom is acquired by special favour of the governing body. There is no criminal jurisdiction beyond that of a justice of the peace, which rank, for the borough, the bailiff and recorder hold *ex-officio.* The court of record is disused. The average revenue is 80*l.* per annum, and the expenditure 150*l.* The corporation in 1835 were 1126*l.* 10*s.* in debt. The patron is the Earl of Roden, who is proprietor of almost the entire site of the town. The present boundary of the borough comprises an area of 445 statute acres.

Prior to the Union, Dundalk returned two members to the Irish parliament. It is now represented by one member in the imperial parliament. The right of election formerly lay with the corporation. It is now, by the 2nd Wm. IV., c. 88, vested in the resident freemen and 10*l.* householders. The number of voters at the last general election was 376.

Dundalk is a place of a very remote antiquity, being the *Dundalgan* of the Irish Ossianic poems, the residence of the hero Cuchullin. It is extremely probable that some earthen and stone works in the neighbourhood of the present town formed a portion of the old *cahir* or city. The situation of the place, on the lowest ford of the Castletown river, in the direct road to Ulster, rendered it early a port of importance to the English. It was here O'Hanlon opposed the march of De Courcy northward in 1179, on which occasion a great number of the Irish were drowned in the fords. The result of the battle was doubtful, but Dundalk remained in the hands of the English. The site and vicinity of the town were afterwards bestowed on Bertram de Verdon, to whom probably the present town owes its origin. On Edward

Bruce's invasion of Ireland in 1315, Dundalk was among the first places that fell into his hands, and here in the succeeding year he caused himself to be crowned king of Ireland. Bruce, after ravaging the south of Ireland with various fortune, returned to the neighbourhood of Dundalk in the latter end of the year 1318. Here he was encountered at the Faughart, a height on the northern side of the Castletown river, by Lord John Bremingham. In this battle Bruce was slain, and his predatory army entirely dispersed. Bremingham for his services was created earl of Louth, and had the manor of Ardee bestowed on him. During the rebellion of Shane O'Neill, in the reign of Elizabeth, Dundalk was besieged by the insurgents, but without success. On the breaking out of the rebellion of 1641, Sir Phelim O'Neill took it without opposition, the garrison having surrendered on the first summons. On the 26th of March, 1642, Lord Moor and Sir Henry Tichbourne, after having driven the Irish from before Drogheda, and retaken Ardee, advanced against Dundalk, which after some resistance they carried by storm, having broken open the main gate with pickaxes. After the capture of Drogheda by Cromwell in 1649, Dundalk surrendered to the parliamentarians. In the war of the Revolution it was evacuated by the forces of James II. on the advance of the army of King William, who took possession of it before he proceeded to the Boyne.

The main street of Dundalk is built along the line of the great northern road, and runs nearly north and south: the other leading streets run eastward from the main street, and parallel to one another, occupying the extreme verge of the plain along the southern bank of the creek, where the Castletown river expands into the sea. At the northern extremity of the main street is the bridge, and south from it the linen-hall and church. The market-house, a decent brick building, and the county-court house, a very handsome edifice of cut stone, are situated nearly in the middle of the main street. The county infirmary, a brick building in the Tudor style, stands at its southern extremity. The demesne of Dundalk-house, a residence of the earl of Roden, skirts the western side of the main street through its entire length. An extensive cavalry barrack terminates the town eastward. The general appearance of Dundalk is highly respectable. The provisions of the lighting and paving act were put in force here in 1832. The amount of the assessment for lighting, paving, and watching for the year 1836 was 696*l* 8*s*. 11*d*.

The corn-trade is very extensively carried on. In the town are a steam-power mill for grinding wheat, a large distillery, and two breweries. Dundalk is the chief point of export for the counties of Cavan, Monaghan, and Fermanagh. The exports of agricultural produce in 1835 consisted of

	Cwts.
Wheat	142,097
Wheat, meal, and flour . .	16,280
Barley	56,280
Malt	53,875½
Oats	229,542¼
Oatmeal	129,260

There is also a large export of butter and eggs, collected principally from the counties of Monaghan, Cavan, and the northern parts of Longford. The butter exported is about 550 tons for the season: the number of eggs exported in 1835 was 2,410,800; of yards of linen 60,000; of lbs. of wool 15,680; of heads of cows and oxen 3932; of horses 100; of sheep 7266; and of swine 48,183. Total value of the exports for that year 452,813*l*. In the same year the imports amounted to 107,953*l*., of which the chief items were for coal, culm, and cinders 19,021*l*.; cotton manufactures 13,800*l*.; woollen manufactures 10,500*l*.; haberdashery 6500*l*.; iron 8960*l*.; fish (herrings) 7000*l*.; oakbark for tanners 4,800*l*.; sugars 2100*l*.; and teas 1400*l*. Two steam-vessels, each of 200 tons register, the property of a Dundalk company, ply regularly between the port and Liverpool. Since the establishment of these, there has been a considerable increase in the amount of imports. The port, although it has not much depth of water, is considered a safe one. A freight will be taken for it in an English port at a less charge than for either of the ports of Newry or Drogheda. There are no harbour dues.

Dundalk is the head of an excise district, embracing Newry and Warrenpoint in the county of Down, Ardee in Louth, and the entire county of Monaghan. The amount of excise paid in the district in 1835 was 112,189*l*. 18*s*. 7½*d*. The customs paid for the port of Dundalk, in the same year, amounted to 3598*l*. 5*s*. 7*d*. A branch of the bank of Ireland is established here.

Ardee is an antient corporation, at present governed by charter of the 28th of February, 1712. The corporation consists of a portreeve, burgesses, and freemen. The governing body is the common-council. There is no criminal jurisdiction beyond that of the portreeve, who is a justice of the peace *ex officio* within the borough. The civil court of the recorder is now disused. It is asserted by the inhabitants that corporate estates to the value of 1000*l*. per annum have been spoliated. The present income of the corporation is 125*l*. [ARDEE.]

Dunleer is incorporated by charter of the 3rd of August, 1678. The corporation is virtually extinct. The town itself is inconsiderable.

Carlingford is an antient corporation, having been, during the existence of the English pale, a place of considerable importance, as commanding the only pass at that time practicable between Dundalk and Newry. The governing charter is dated 19th of August, 1619. The corporation is virtually extinct.

Prior to the Union, Louth returned two county members and two for each of the above boroughs. The representation is now limited to two county members, and one for Dundalk. The county constituency, at the end of 1836, consisted of 1194 voters. On the 1st of January, 1836, the police force of the county consisted of 4 chief constables, 22 constables, 107 subconstables, and 5 horse of the constabulary, supported at a cost of 5121*l*. 13*s*. 5*d*., of which 2469*l*. 18*s*. 8*d*. was chargeable against the county; and of 1 magistrate, 21 constables, 70 subconstables, and 2 horse of the peace-preservation police, the cost of supporting which establishment was 4400*l*. 16*s*. 5*d*. In the same year the total number of persons charged with criminal offences who were committed to the county gáol was 321, of whom 288 were males and 33 females. Of these 91 males and 4 females could read and write at the time of their committal, 137 males and 20 females could read only, and 60 males and 9 females could neither read nor write. The assizes for the county are held at Dundalk, and general quarter-sessions at Dundalk, Drogheda (a county in itself), and Ardee, in which last place is a court-house and bridewell. The district lunatic asylum is at Dublin. This asylum was originally built in the year 1815, by parliamentary grant, for admission of all pauper lunatics throughout Ireland. It was created a district asylum by act of 11 Geo. IV., c. 22, and is now annexed to the district formed by the counties of Wicklow, Dublin, Meath, Louth, and the counties of the city of Dublin and of the town of Drogheda. The county infirmary at Dundalk is a very extensive and complete establishment. There are dispensaries in all the minor towns. There is no local newspaper.

Louth, at the coming of the English, formed a portion of the territory of Orgial or Oriel, by which name it afterwards came itself to be known in contradistinction to the more western parts of the territory. The native families of chief authority in the territory at this time were the O'Kervaills, or O'Carrols, and the MacMahons. Donchad O'Kervaill, prince of Orgial, was the founder of several religious houses in the present county of Louth, about the middle of the twelfth century: among these was the Cistercian abbey of Mellifont, the consecration of which, in A.D. 1157, was attended by a great assemblage of the Irish nobility. Among those who bestowed gifts on the new establishment on that occasion was Devorgilla, wife of O'Rourk, whose elopement with Dermot MacMorrogh shortly after led to the English invasion. The eastern part of Orgial, constituting the present Louth, having been conquered by De Courcy between 1179 and 1180, was erected into a county by King John, A.D. 1210. Being at the time accounted a portion of Ulster, it formed part of the grant to De Courcy, and after his time to De Lacey, by whom it was divided among inferior barons. The families of De Verdon, Pippard, Taaffe, Bellew, and Gernon were among those introduced at this period. During the decay of the English authority, in the fourteenth and fifteenth centuries, Louth remained attached to the government. The preservation of the county from the general spirit of defection then abroad was owing, in a great measure, to the institution, by act of the 12th Edw. IV., of the Brotherhood of St. George, a military fraternity composed of thirteen of the chief nobility and gentry of the counties of Kildare, Dublin, Meath, and Louth, and having for its object the protection of the pale from the neighbouring Irish, and the arrest of outlaws and rebels within the above counties. The subsequent history of Louth, which was not considered a portion of Leinster until the reign of Elizabeth, is in great measure that of Drogheda and Dundalk. [DROGHEDA.] The forfeitures consequent on the rebellion of 1641 and the ensuing civil wars extended over nearly the entire county. Those which followed the war of the Revolution of 1688 embraced 22,508 acres, of an estimated value, at that time, of 82,310*l*, 3*s*.

The numerous antiquities which occur throughout Louth have been made the subject of a volume entitled 'Louthiana,' published at Dublin in 1758. Earthen mounds and entrenchments are of very frequent occurrence. The most remarkable in the county is that of Castle-Guard at Ardee. Its perpendicular height is nearly 90 feet, the depth of the main trench between 30 and 40, the circumference at the top 140, and round the base upwards of 600 feet. The mound and building called *Fuhs na ain Eighe*, or 'the one night's work,' near Dundalk, is a curious combination of the earthen *rath* with the stone *cashiol*, and is probably coeval with the Dundelgan of the Ossianic romances. Stone circles and other supposed Druidic remains are also numerous. The most remarkable are at Ballirckan and Ballinahatry, near Dundalk. At Ballymascanlan is a cromlech, the covering-stone of which measures 12 feet by 6, and weighs upwards of thirty tons. Round towers formerly stood at Louth and Drogheda, and two are still remaining at Dromiskin and Monasterboyce. The last is one of the finest specimens in the kingdom: it is 110 feet high, but has lost the greater part of its conical covering. In the churchyard near the tower stand two beautifully sculptured stone crosses. The larger, called St. Boyne's Cross, is 18 feet high. On the base of the smaller, which is 16 feet in height, is an inscription, on which 'Pray for Muredoch' is legible in very antient Irish characters. The arms of these crosses are enclosed in circles, and the entire surface of each is covered with rich tracery and allegorical sculpture. St. Boyne is probably a corruption of the name of St. Buas, the founder, who died A.D. 521. Muredoch, by whom the other cross was probably set up, died A.D. 836. The ruins of the abbey of Mellifont occupy a beautiful site on the bank of the Mattock river, near the Boyne. They consist of a gate-tower, part of a chapel, and the lower story of an octagonal chapter-house. The ornamental part of the doorways and arches of the two latter buildings are formed of blue marble, and have been highly gilt. There are some very antient ruins on the hill of Faughart, where Edward Bruce is said to be buried, connected with the old cell of St. Brigid. Of the various feudal buildings throughout the county the chief are the castle of Carlingford, erected by King John, Rohe's Castle, north-west of Dundalk, Torfeckan or Termonfeckin Castle, a residence of the archbishops of Armagh, inhabited last by Primate Ussher, and Castletown, still kept in habitable order, on the south bank of the Castletown river near Dundalk.

Louth lies partly in the diocese of Clogher, but chiefly in that of Armagh, which extends into the counties of Armagh, Londonderry, Tyrone, Louth, and Meath. The number of parishes in this diocese is 98, constituting 88 benefices, and having 88 churches of the Establishment, 11 other places of Protestant worship in connection therewith, 68 Presbyterian meeting-houses, 44 meeting-houses belonging to other Protestant Dissenters, and 120 Roman Catholic chapels. In 1834 the total population of the diocese was 500,636, of whom there were 103,012 members of the Established Church, 84,837 Presbyterians, 3340 other Protestant Dissenters, and 309,447 Roman Catholics, being in the proportion of 3 Roman Catholics to 1·88 Protestant, of whatever denomination. In the same year there were in this diocese 623 daily schools, in which 44,606 young persons received instruction; being in the proportion of 8·10 per cent. of the entire population under daily tuition, in which respect Armagh stands fourteenth among the 32 dioceses of Ireland. Of the above schools, in 1834, there were sixty-seven in connection with the National Board of Education.

The county expenses are defrayed by grand-jury presentments. The amount levied for the year 1835 was 11,247*l*. 2*s*. 8*d*., of which 2749*l*. 14*s*. 7*d*. was for roads and bridges, 4509*l*. 6*s*. 10*d*. for buildings, salaries, charities, &c., and 3988*l*. 1*s*. 3*d*. for police.

LOUTH. [LINCOLNSHIRE.]

LOUTHERBOURG, PHILIP JAMES DE, a distinguished landscape painter, born at Strasburg, October 31, 1740, was the son of a miniature painter who died at Paris in 1768. He at first studied under Tischbein, afterwards under Casanova, whose name as an historical painter was then in great vogue. While his own peculiar forte lay in landscape, he was enabled by his education to give to that branch of the art a greater compass and range of subjects than usual, as in his various battle and hunting pieces, besides others that claim to be considered as strictly historical in subject; for instance, his 'Storming of Valenciennes' and 'Lord Howe's Victory in June, 1794.' His works are stamped by great vigour and mastery of pencil, and by excellent management in regard to composition. After having obtained considerable reputation at Paris by the works which he exhibited at the Louvre, and having been admitted a member of the Academy there in 1768, Loutherbourg came over to England (where he was afterwards elected a royal academician) in 1771, and was engaged as scene-painter at the Opera House. His vigorous style of execution, his poetical imagination, and his perfect knowledge of scenic effect, well qualified him for a department of art which demands them all, and which is held to be a subordinate one chiefly because its productions are soon laid aside and entirely forgotten. Soon after his settling in this country, Loutherbourg got up, under the name of the *Eidophusikon*, a novel and highly ingenious exhibition, displaying the changes of the elements and their phenomena, in a calm, a moonlight, and a sunset and a storm at sea. Of this very interesting pictorial contrivance, which may be said not only to have anticipated, but in some respects to have surpassed our present dioramas, although upon a smaller scale, a tolerably full account is given in Pyne's 'Wine and Walnuts.'

Loutherbourg etched several of his own compositions. He died at his residence at Hammersmith-terrace, March 11, 1812.

LOUVAIN (the French name of *Leuven*), a very antient town in South Brabant, in 50° 54′ N. lat. and 4° 39′ E. long. It stands on the Dyle, 16 miles east from Brussels, and about the same distance south-east from Mechlin, or Malines, and north-west from Tirlemont. The system of railroads from Ostend, Bruges, Ghent, Antwerp, and Brussels, which unite at Malines, is continued through Louvain and Tirlemont to Liege, and will be further continued through Aix-la-Chapelle to Cologne, and eventually to Bonn, where its further progress will be impeded by natural difficulties. Louvain was surrounded by walls in 1156, and was for a long time the residence of the dukes of Brabant. In those times Louvain was the largest, the richest, and the most commercial city in the country. Its principal trade consisted in woollen manufactures, which are said to have been prosecuted to such an extent at the beginning of the fourteenth century as to give employment to 150,000 workmen; but this number appears to be exaggerated. The weavers, in 1382, revolted against the duke of Brabant, and for a time desolated the province, but were speedily reduced to obedience; and the ringleaders being exiled, the greater part of them came to England, where they introduced the manufacture of broad-cloth. The walls of Louvain are nearly seven miles in circumference; but a great part of the space enclosed is no longer occupied by houses, which have been succeeded by gardens and vineyards. The population is now about 27,000, or only one-sixth of what it was 400 years ago.

The manufacture of woollens and lace is now carried on in Louvain to a small extent. There are several breweries in the town, and the beer of Louvain enjoys a high reputation, and has a great sale in other parts of Belgium. There is also a trade to some extent in agricultural produce.

The university of Louvain was established in 1426 by John, the fourth duke of Brabant, and long enjoyed a high celebrity. It was suppressed by the French in 1795, and the building converted into an hospital, but was restored in 1817, and is again a flourishing institution with 60 professors and 700 students: it has a botanic garden and zoological and mineralogical museums.

The town-hall, which is a fine Gothic building, erected in 1450, contains some good paintings. The church of St. Peter is one of the finest religious edifices in Belgium; the tower, which fell down in 1604, is said to have been 533 feet high. The town is in general not well built.

LOUVIERS, a town in France in the department of Eure, is on the river Eure, and on the road from Evreux to Rouen, 12 miles from Evreux and 17 from Rouen. This town was anciently fortified. In the religious wars of the sixteenth century the townsmen embraced the party of the League, and afforded an asylum to the parliament of Rouen, when driven out of the city by the Protestants; but they submitted to Henri IV. after the battle of Ivry. The town is handsomely built, and situated in a fertile plain; it has an ancient church of Gothic architecture, and promenades round the site of the ramparts. The population in 1831 was 8627 town, or 9885 for the whole commune; in 1836 it was 9927 for the commune. The chief manufacture is of fine woollen cloths and kerseymeres, first introduced in 1681, and now the most important of the kind in France; there are upwards of forty factories. Other woollen goods also are made. There are mills for spinning woollen, linen, and cotton yarn, moved by water; there are also dye-houses for cotton and wool, linen-bleaching establishments, tan-yards, soap-houses, sugar-refining houses, and workshops for making the machinery employed in the various factories and mills. There are a subordinate court of justice, several government offices, a public library, and a theatre. There are four yearly fairs. The fine cloths are sent chiefly to Paris; the remainder are exported. The wool is chiefly brought from Spain. The arrondissement of Louviers contains 302 square miles, and is divided into five cantons and 119 communes. It had a population of 65,742 in 1831, and of 66,462 in 1836.

LOUVRE. [PARIS.]

LOVE APPLE, a fruit-bearing annual, also called Tomato, is the Solanum Lycopersicum of botanists, a plant much cultivated for the sake of its berries, from which are obtained various preparations used for culinary purposes. It is a native of Peru and Brazil, whence it has been carried into North America and the Old World; and it has become, as it were, naturalized in some parts of India. The common love-apple has depressed round lobed irregular berries, varying in size from one to three or four inches in diameter, and in colour from dull red to yellow. When raw they have a singular flavour, not unlike that of cooked meat, but they are never brought to table except stewed or in the form of sauce. The only directions for the cultivation of the Tomato which it is necessary to give are, that it should be treated like a tender annual, and when planted out have a southern bank or wall, or some trellis, over which the branches may be dispersed. In this climate the summers are too short to ripen the fruit unless assisted by artificial heat. Many varieties are known, which some botanists consider distinct species; they principally differ in the form, colour, and size of their fruit. They all are at variance with the usual character of the genus Solanum, in having a fruit with an irregular number and arrangement of its cells, on which account they have been collected by Dunal into a particular genus, to which he gave the name of Lycopersicum, distinguishing eleven species, and calling the common garden love-apple *L. esculentum*.

LOW COUNTRIES, or **NETHERLANDS**, a district in the north of Europe, lying between 49° 30′ and 53° 40′ N. lat., and between 2° 40′ and 7° 10′ E. long., comprehending the kingdoms of Holland and Belgium, and grand-duchy of Luxemburg. It is bounded on the east by the Rhenish provinces of Prussia and the kingdom of Hanover, on the north and the west by the North Sea, and on the south by the kingdom of France.

LOWER GREEN-SAND. [CRETACEOUS GROUP.]

LOWTH, WILLIAM, born 1661, died 1732, the elder of two divines of the Church of England, father and son, both distinguished by eminent attainments in biblical literature and by their useful publications. The elder is the less eminent, though he is supposed to have been the profounder scholar; but he lived less in the public eye, and attained to none of the dignities which were bestowed on the son. Early in life he became chaplain to Mew, bishop of Winchester, who gave him a prebend in the cathedral of Winchester, and the rectory of Buriton in that diocese, where he lived, died, and was buried. He had been a pupil of Merchant Taylors' School, from whence he had passed to St. John's College, Oxford.

If we would form an idea of the extent of his laborious reading, we must look rather to the works of other persons than his own, and particularly to Potter's edition of the works of Clemens Alexandrinus, and Hudson's edition of the works of Josephus. To both these editors he communicated valuable notes. Of his own writings, those which are now most read are his 'Directions for the Profitable Reading the Holy Scriptures,' which was first published in 1708, and has been often reprinted, and his 'Commentary on the four greater Prophets.' This last-named work usually accompanies Bishop Patrick's Commentary on the other books of Scripture, to which it was prepared as a supplement.

LOWTH, ROBERT, born 1710, died 1787, a prelate of the English Church, son of the Lowth last named, and, like his father, distinguished by his knowledge of the books of Scripture and his valuable writings in the illustration of them. He was also an elegant scholar, and an inquirer into minute and curious history. There are a few poems of his, chiefly in the nature of academical exercises, which in their day were greatly admired.

He was educated in the school of Winchester founded by William of Wickham, from whence he passed to New College, Oxford, which was also founded by the same munificent prelate. He went abroad with members of the Dartmouth and the Devonshire families, who, especially the latter, favoured his advancement in the church; and having the good fortune to secure also the patronage of Hoadly, bishop of Winchester, he rose by regular gradations till he became bishop of London, and in a situation to decline the offer which was made to him by King George III. of the archbishopric of Canterbury. A few dates of his preferments may suffice. Early in life he had the rectory of Ovington; in 1750 he was made archdeacon of Winchester; in 1753 rector of East-Woodhay in that diocese; in 1766 he became bishop of St. David's; in the same year he was translated to Oxford; and in 1777 was made bishop of London.

In speaking of the writings with which Bishop Lowth has enriched the literature of his country, we shall pass over his minor tracts, even those which belong to his controversy with Bishop Warburton, arising out of a trifling difference of opinion respecting the Book of Job. The controversy was conducted on both sides with a virulence rarely witnessed in these days in the disputes of literary men, and the pamphlets may be recommended to any one who can relish angry disputations seasoned by learning and wit. Writings on which we can dwell with greater satisfaction are his 'Life of William of Wykeham,' first published in 1758, an admirable specimen of the results to be attained by curious and recondite biographical research; and his 'Lectures on the Poetry of the Hebrews,' which were delivered by him in the University when he was professor of poetry. These lectures may be said to have opened an almost new subject, little attention having been previously paid to the laws of Hebrew poetry, or even to the fact that large portions of the books of the Old Testament are poems, in the strict and proper sense of the word, though presented to the English reader in a mere prose version, and as if there was no difference between them and the parts of those Scriptures which are really prose. They were received, when published, with great respect by the learned, not of England only, but of the Continent, where they were reprinted, with a large body of valuable notes by the learned biblical scholar J. D. Michaelis. These lectures were published by Lowth in Latin, the language in which they were delivered, but there is an English translation of them by Dr. Gregory, published in 1787. In 1778, the year after he was promoted to the bishopric of London, he published a 'Translation of the Prophet Isaiah,' distinguishing the poetical from the parts written in prose, and exhibiting the various forms of Hebrew parallelisms which occur in that prophet, and which he had explained and illustrated in his lectures. He gave a large body of valuable notes. These were his greater works; but he published also an 'Introduction to English Grammar,' which was thought valuable at the time, and was often reprinted, but is now nearly superseded and forgotten.

A volume containing memoirs of his life and writings was published soon after his decease.

LOXA, or LOJA, a town of Spain, in the province of Granada, 30 miles west of Granada and 40 north-east of Malaga, at the north base of a ridge of hills and in a valley watered by the river Genil. It has manufactories of printed cottons and paper, three parishes, a clerical college, two hospitals, and 13,000 inhabitants. The territory is fertile and well watered, and produces corn, maize, pulse, oil, and abounds in oak-trees. (Miñano.)

LOXI'ADÆ, Mr. Vigors's name for a family of birds placed by him as the extreme of the tribe of *Conirostres*, which is the third tribe of his *Insessores*, or perching birds, and intervenes between the *Dentirostral* and *Scansorial* tribes in his system.

Mr. Vigors remarks, that notwithstanding their inferiority of size, some species of the family may be observed to equal even the *Hornbills*, allowance being made for their relative proportions, in the extreme enlargement of the bill. 'The curved and serrated bill of the latter family' (*Hornbills*), says Mr. Vigors, 'perceptibly shortening itself, as we have perceived in *Momotus*, is still carried on to a corresponding group in the present, the *Phytotoma*, Gmel., where these characters are preserved, though the curve is slighter and the serration less strong. United to that genus by some intermediate but uncharacterised species, the *Coccothraustes*, Briss., conducts us to several groups, among which *Pitylus*, Cuv., *Strobilophaga*, Vieill., the true *Loxia* of authors, and *Psittirostra*, Temm., may be distinguished; from whence we pass to the shorter-billed groups, among which *Colius*, Linn., and *Cissopis*, Vieill., may be particularised. These are but few of the natural genera which abound in this extensive family. Many intervening species, possessing strong genuine distinctions, may be introduced among these groups, which at length terminate in some of the shorter and stronger-billed species of the Linnean *Tanagers*. These, it will be remembered, commenced the present tribe (*Conirostres*) by their union with the *Fringillidæ*: and thus here also the circular succession of affinities extends uninterrupted through the whole subdivision.' ('Natural Affinities that connect the Orders and Families of Birds,' *Linn. Trans.*, vol. xiv.)

Mr. Swainson (*Classification of Birds*) appears to reject the family altogether; for we find *Phytotoma* among the *Phytotomina*, a subfamily of *Musophagidæ*; *Coccothraustes* under the subfamily *Coccothraustinæ*; *Pitylus* under the subfamily *Tanagrinæ*; *Strobilophaga* under the 'Generic names not adopted;' *Loxia* and *Psittirostra* in the subfamily *Pyrrhulinæ*; *Colius* in the subfamily *Colinæ* (family *Musophagidæ*); *Cissopus* (Cissopis) cancelled; and the *Tanagers* under the subfamily *Tanagrinæ*; the subfamilies, with the exception of the two placed under the *Musophagidæ*, being arranged under the family *Fringillidæ*. Mr. Swainson's *Conirostres* (his second tribe of *Insessores*) consist of the families *Corvidæ*, *Sturnidæ*, *Fringillidæ*, *Musophagidæ*, with their subfamilies, and *Buceridæ*.

Having given the reader a sketch of the views of the ornithologists above quoted, we shall confine ourselves in this article to Brisson's genus *Loxia* only, of which M. Temminck remarks that its characters exclude all other species, being proper to the *Crossbills* only. Illiger, he observes, in his *Prodromus* is also of this opinion.

Loxia. (Crossbill.)

Generic Character.—*Bill* moderate, strong, very much compressed; the two mandibles equally curved, hooked, and the elongated points crossing each other. *Nostrils* basal, lateral, rounded, concealed by hairs directed forwards. *Feet* with three toes before and one behind, anterior toes divided. *Wings* moderate, the first quill longest. *Tail* forked.

M. Temminck, who gives the above generic character, records two species, *Loxia Pytiopsittacus* and *L. curvirostra*, in his second edition (1820), and *L. leucoptera*, in his third part of that edition (1835). The same three species, the first under the name of *L. pinetorum*, are recorded by Mr. Swainson.

Geographical Distribution of the Genus.—The north both of Europe and America. One species however, *L. curvirostra*, is found in Japan as well as in Europe.

Example, *L. curvirostra*, the *common Crossbill*.

Before we go into the history of this species, it will be well to call the reader's attention to the curious organisation of the *bill* in this genus. Buffon, who, as we have too often been obliged to repeat, frequently saw deformity where all was harmony and symmetrical adaptation, does not lose this opportunity of misconstruing what he did not clearly understand. He speaks of the bill in these birds as an error and defect in nature—a deformity. If he had ever kept these birds in a cage, he would soon have found that no instrument could have been better adapted to the work required of it; and if they had ever visited his orchards he would have been convinced to his cost of its efficacy in splitting fruits for the purpose of getting at the kernels.*

Mr. Yarrell has well illustrated the structure and moving power of this organ, which, conjoined with the peculiar tongue, will be found a most perfect and beautiful piece of mechanism for attaining the end in view.

'The beak of the Crossbill,'† writes the author last mentioned, 'is altogether unique in its form; the mandibles do not lie upon each other with their lateral edges in opposition, as in other birds, but curve to the right and left, and always in opposite directions to each other. In some specimens the upper mandible is turned to the right, the lower mandible curved to the left; in others, the position of the mandibles is reversed as to their direction. In the specimen I examined the upper mandible curved downwards and to the left, the under portion turned upwards and to the right. When holding the head of this bird in my fingers, I found I could bring the point of the under mandible in a line underneath and touching the point of the upper, but not beyond it towards the left side; while on its own side the point passed with ease to the distance of 3-8ths of an inch. The upper mandible has a limited degree of motion on the cranium, the superior maxillary and nasal bones being united to the frontal by flexible bony laminæ.'

Mr. Yarrell then proceeds to the details of the anatomy, which he illustrates by the seven figures copied below. He first notices the peculiarity of the form, as well as of the magnitude of the processes of some of the bones of the head in this bird, and points out that the pterygoid processes of the palatine bones are considerably elongated downwards (*fig.* 3, *a*) to afford space for the insertion of the large pterygoid muscles. The os omoideum (*fig.* 3, *b*) is strongly articulated to the os quadratum (*fig.* 3, *c*), affording firm support to the moveable portion of the upper mandible. The jugal bone (*fig.* 3, *d*, *d*) is united to the superior maxillary bone in front, and firmly attached by its posterior extremity to the outer side of the os quadratum. Thus, when the os quadratum is pulled upwards and forwards by its own proper muscles, the upper mandible is elevated by the forward pressure of that bone.

---

* Buffon, after noticing the deformity, remarks that it is 'cette espèce de difformité qui seule distingue cet oiseau du gros-bec,' &c.; 'car il est l'unique qui ait ce caractère ou plutôt ce défaut; et la preuve que c'est plutôt un défaut, une erreur de nature, qu'un de ses traits constans c'est que le type en est variable,' &c.; and yet he was aware of the use which the bird makes of it, in part at least; for he further says, 'Mais comme il n'existe rien qui n'ait des rapports et ne puisse par consequent avoir quelqu' usage et que tout être sentant tire parti même de ses défauts; ce bec difforme, crochu en haut et en bas, courbé par ses extrémités en deux sens opposés, paroît fait exprès pour détacher et enlever les écailles des pommes de pin et tirer la graine qui se trouve placée sous chaque écaille.' Buffon then describes how the operation is performed, and adds, 'On lui verra exécuter cette manœuvre en suspendant dans sa cage une pomme de pin mure:' for this he quotes Frisch, and goes on to notice the use of the bill made by the bird in climbing about the cage. He does not however appear to have kept the Crossbill so confined himself, or he would hardly have called it 'plus bête que les autres oiseaux,' nor should we have found in his index 'sa stupidité,' nor in his text 'Il n'a nulle impatience dans la captivité.'

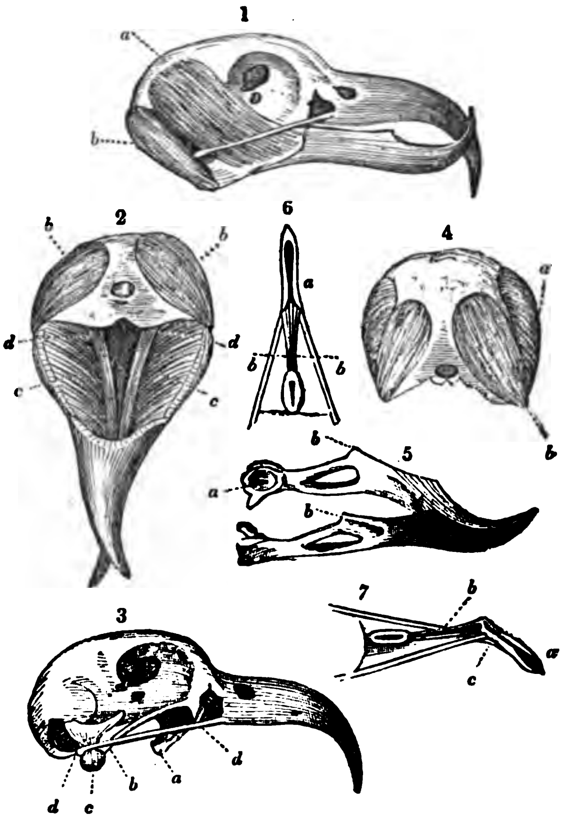
† Loxia curvirostra.

In most other birds the inferior projecting process of the os quadratum, to which the lower jaw is articulated, is somewhat linear from before backwards, and compressed at the sides, permitting vertical motion only upwards and downwards; but in the crossbill these processes are spherical (*fig.* 3, *c*), and the cavity in the lower jaw destined to receive the process is a circular cup (*fig.* 5, *a*): from the union of these two portions there results an articulation with all the motion and flexibility of the mechanical ball and socket joint.

The lower jaw is very strong and the sides or plates are elevated; the coronoid processes (*fig.* 5, *b*, *b*) are prominent, and to these, as well as to the whole outer side of the plates, the temporal muscle is attached. In a head of this bird which had been divested of all the soft parts, Mr. Yarrell found that, on sliding the lower jaw laterally upon the other, as performed by the bird, before the coronoid process is brought into contact with the pterygoid process on its own side, the extreme points of the mandibles were separated laterally to the extent above-mentioned (3-8ths of an inch).

The right side of the head was that to which the lower jaw inclined in the specimen examined by Mr. Yarrell, and on that side the temporal and pyramidal muscles were considerably larger than those on the left (*figs.* 1, 2, 4, *a*, *b*), indicating by their bulk the great lateral power which the bird is capable of exerting. The pterygoid muscles (*fig.* 2, *c*, *c*), on each side were unusually large, the great distance to which the articulated extremities of the lower jaw were removed affording ample space for them, and as the food of the bird consists of small seeds, a narrow pharynx is sufficient for the purposes of deglutition. For depressing the lower mandible three muscles are called into action; but only one of these, the great pyramidal (*figs.* 1, 2, 4, *b*), which covers two other small ones, the triangular and square muscles, is visible. All three have their origin on the occipital portion of the cranium, and are inserted by strong tendons on the under and back part of each extremity of the lower jaw, behind the centre of motion; they consequently, by their simultaneous contraction, raise the point to which they are attached, and depress the anterior part of the mandible. The lower parts of the ossa quadrata are pushed rather forwards by this compression, with the help of two small muscles (not figured), but whose situation may be explained by a reference to *fig.* 3. One of these, a small flat muscle, arises from the septum of the orbits behind the small aperture in the septum, and passes downwards for insertion upon the projecting styloid process of the os quadratum; the second is a small pyramidal muscle, arising also from the septum, anterior to the other muscle; and, passing downwards and backwards, is inserted upon the os omoideum: both these, when they contract, pull the os quadratum forwards, and so elevate the other mandible. Thus the depressors of the lower jaw, and the elevators of the upper jaw, act together to separate the mandibles. To close them, the temporal and pterygoid muscles elevate the lower jaw, assisted by the slender slips (*fig.* 2, *d*, *d*), which, extending forwards to the superior maxillary bones, act in concert by bringing them down. To work the lateral motion, the great pyramidal muscle on the right side pulls the extremity of the lower jaw, to which it is attached, backwards, the pterygoid muscles of the left side at the same time powerfully assisting by carrying that side of the lower jaw inwards.

Mr. Yarrell then quotes Mr. Townson, to show the adaptation of these parts to the wants of the bird in feeding. 'The great pine-forests, such as the Hartz in Germany,' says Mr. Townson, 'are the natural places of residence of the Crossbeaks, and the seed of the cones of these trees their food; and it is to pull out the seeds from between the squamæ, or scales of the cones, that this structure is given them. Their mode of operation is thus:—they first fix themselves across the cone, then bring the points of the maxillæ, from their crossed or lateral position, to be immediately over each other. In this reduced compass they insinuate their beaks between the scales, and then opening them, not in the usual manner, but by drawing the inferior maxilla sideways, force open the scales or squamæ.' It is at this stage of the proceeding, observes Mr. Yarrell, that the aid of the tongue becomes necessary; and here again we have another instance of beautiful adaptation. There is articulated to the anterior extremity of the os hyoides, or bone of the tongue, an additional portion, formed partly of bone, with a horny covering (*figs.* 6, 7, *a*). This is narrow, and about ⅜ths of an inch in length, extending forwards and downwards, with the sides curved upwards, and the distal extremity shaped like a scoop somewhat pointed and thin on both edges, the proximal extremity ending in two small processes elongated upwards and backwards above the articulation with the bone of the tongue, each process having inserted upon it a slender muscle (*figs.* 6, 7, *b*) extending backwards to the glottis and attached to the os hyoides; and these muscles, by their contraction, extend and raise the scoop-like point. 'Underneath the articulation of this horny grooved appendage,' continues Mr. Yarrell, 'is another small muscle (*c*, *fig.* 7), which is attached at one extremity to the os hyoides, at the other to the moveable piece, and by its action, as an antagonist to the upper muscles, bends the point downwards and backwards; whilst therefore the points of the beak press the shell from the body of the cone, the tongue, brought forward by its own muscle (genio-hyoideus) is enabled, by the additional muscles described, to direct and insert its cutting scoop beneath the seed, and the food thus dislodged is transferred to the mouth: it will be seen by a reference to the first figure, that when the mandibles are separated laterally in this operation, the bird has an uninterrupted view of the seed in the cavity,



1. Skull of Crossbill, side view; *a*, temporal muscle; *b*, great pyramidal muscle. 2. Head viewed from below; *b*, great pyramidal muscle; *c*, *c*, pterygoid muscles; *d*, *d*, graciles muscles. 3. Head viewed from the side; *a*, pterygoid process; *b*, os omoideum; *c*, os quadratum; *d*, *d*, os jugale. 4. Head viewed from behind; *a*, right temporal muscle; *b*, great pyramidal muscle. 5. Lower jaw, side view; *a*, cavity for articulation; *b*, *b*, coronoid processes. 6. Tongue seen from above; *a*, horny scoop; *b*, *b*, extensor muscles. 7. Tongue, side view; *a*, horny scoop; *b*, extensor muscles; *c*, flexor muscle. (Yarrell, *Zool. Journ.*, vol. iv.)

Head of Crossbill.

with the eye on that side to which the under mandible is curved.' So much for Buffon's 'error and defect of nature, and deformity.'

Description of Loxia curvirostra.—Adult and Old Male.—Principal colours of the plumage ash strongly tinged with greenish; front, cheeks, and eyebrows grey, with yellowish and whitish spots; back, small coverts of the wings, and scapulars, greenish; rump yellow; lower parts yellowish-green; abdomen grey, with deeper spots; wing and tail-feathers blackish, bordered with greenish; great and lesser coverts bordered with yellowish white; iris and feet brown; bill horn-colour. Length, about 6 inches.

Male from its first moult to the age of one year.—All the upper and lower parts of the body brick-red, more or less tinged with greenish and yellowish; wing and tail-feathers black, bordered with reddish-green; lower coverts of the tail white, with a great brown spot in the centre.

Young of the year.—Upper parts grey-brown, clouded with greenish; rump yellowish; lower parts whitish, with longitudinal brown and black spots.

Female.—In all ages, differing but little from the *young;* the plumage is clouded with greenish and yellowish tints. Neither in this species nor in *L. Pytiopsittacus* does the female ever assume the red livery, which is only peculiar to the male after its first moult up to the age of one year.

Such is M. Temminck's description in the second edition of his 'Manuel' (1820); but in the third part (1835), he states that the principal tints under which the *male* presents itself are more or less of a brick or vermillion-red, the middle of the belly being whitish. The *males of a year old* are of a tarnished red, of a yellowish-red, of a greenish-yellow, or tarnished yellow clouded with reddish. The *old females* have the upper part of the body deep grey, the rump of a yellowish green, the lower part of the body of a bright grey clouded with greenish. M. Temminck adds that he has seen *males* with the summit of the head, belly, and rump of a beautiful yellow, with a large brown band behind the eyes, and the rest of the plumage like the old female. M. Temminck says (in the same part) of the genus generally, that the red or reddish livery of the males is not, as had been erroneously believed, peculiar to a limited period of life, but is the perfect state of plumage in the male sex: after quoting M. Brehm's proofs of the nidification, M. Temminck goes on to state that the old males have a red plumage; the young a reddish plumage, reddish-yellow, or yellowish; the females a yellowish-green, and the young a grey or greyish plumage.

Mr. Gould (*Birds of Europe*) observes that in the minds of many naturalists some doubts still exist, and that they existed till lately in his own, as to whether the rich rosy-red colouring assumed by this bird is characteristic of the breeding season, or the permanent livery of the adult male He states that during his recent visit to Vienna he had an opportunity of observing both sexes in every stage, an examination of which afforded him abundant proofs that the red plumage is acquired during the first autumn, for he saw many lately fledged that had their plumage thickly spotted; others that had partially lost their spotted appearance, and had partly assumed the red colouring; and others that had their feathers entirely tinted of this colour; while the adults, as most ornithologists have stated, were characterised by a plumage of olive-green, which appears to be permanent.

This bird is *Loxia curvirostra* of Linnæus; *Becco in croce, Crocione* and *Crosiero* of the Italians; *Bec croisé* and *Bec croisé commun* of the French; *Fichten Kreuzschnabel* or *Kreutzschnabel* and *Mittlerer Gebirgs und Fichten-Kreutzschnabel* of the Germans; *Kruisvink* of the Netherlanders; *Mindre Korsnabb* of the Scandinavians; *Crossbill, Common Crossbill,* or *Shell-Apple* of the modern British; and *Gylfingroes* of the antient British.

Habits, Reproduction, &c.—Willughby, who notices its change of colour, says that it is a most voracious bird; much delighted and feeding very fat with hemp-seed. 'It also,' he adds, 'loves fir-kernels. … They say, that with one stroke of its bill it will in a trice divide an apple in halves, that it may feed upon the kernels, by that means doing a great deal of mischief in orchards.' Mr. Townson, who kept some, states that the degree of the lateral power of these birds is surprising, that they are fond of exercising it for mere amusement, and are therefore not a little mischievous. 'My pets,' says the last-mentioned author, 'would often come to my table whilst I was writing, and of my pencils, little chip-boxes in which I occasionally kept insects, and other similar objects, and tear them to pieces in a minute. Their mode of operation is by first pecking a little hole; in this they insert their bill, and then split or tear the object by the lateral force. When I treated them, as I often did, with almonds in their shells, they got at the kernel in the same manner; first pecking a hole in the shell, and then enlarging it by wrenching off pieces by the lateral power.' Mr. Yarrell,—who, in his paper in the 'Zoological Journal,' from which we have taken the organization of the bill, observes that notwithstanding Buffon's assertion to the contrary,* they can pick up and eat the smallest seeds, and shell or husk hemp and similar seeds,—gives the following interesting account of the habits of a pair in captivity. We must premise that Willughby also remarked that when kept in cages they climb up and down the sides with their bills and feet, after the manner of parrots. 'My friend Mr. Morgan,' says Mr. Yarrell, 'kept a pair of these birds for some time, and had opportunities for observing their curious habits. They were impatient under confinement, and restless, climbing over the wires of their cage, by the use of their beak and claws, like parrots. One of their principal occupations was twisting out the ends of the wires of their prison, which they accomplished with equal ease and dexterity. A short flat-headed nail that confined some strong net-work was a favourite object on which they tried their strength; and the male, who was usually pioneer in every new exploit, succeeded by long continued efforts in drawing the nail out of the wood, though not without breaking off the point of his beak in the experiment. Their unceasing destruction of cages at length brought upon them sentence of banishment. During the period of their captivity a complete change took place in the colour of their plumage, without the shedding of a single feather.'

The *nest* is generally placed in the fork of a lofty branch in fir and other trees; it is built of moss, lichens, and other such materials, and lined with feathers. *Eggs* four or five, greyish or dirty white, with irregular bright blood-red patches at the larger end, and smaller specks dispersed over the remaining portions. Temminck says that in Livonia it builds in the month of May, but the general period of nidification mentioned by authors is during the winter or very early in spring. Whilst they are at work on the fir-cones their note is a gentle twitter, and they may be seen climbing about the branches like *Parrots;* but they are said besides to have a pleasant song, which is only poured forth in the winter months, or at the season of incubation.

M. Brehm declares that the nidification and laying of eggs takes place in all seasons, and he attributes this peculiarity to the comparative abundance or scarcity of food. It appears to be certain that *Crossbills* make their nests in December, as well as in March, April, and May.

Localities.—Germany, Poland, Sweden, &c., America (?)† and Japan, in which last locality it is called Isuga. The Prince of Musignano (C. Bonaparte) notes it as very rare and accidental, appearing only in the coldest winters near Rome; but as not rare in Philadelphia in the winter.‡ It can only be considered as an occasional visitant to the British Islands. Willughby says, 'Sometimes they come over to us, and in the western part of England, especially Worcestershire, make bad work, spoiling a great deal of fruit in our orchards.' About the commencement of the present century a large flight came to the south of Ireland in the autumn, and did much damage to the apples, &c.; numbers of these birds were taken and kept in cages at that time. Mr. Selby notices the immense flocks that visited England and Scotland in 1821. They spread themselves through the country, and were to be seen in all woods and plantations where the fir-tree abounded. Their first appearance was in the early part of June, and the greater part of the flocks seemed to consist of females and the young of the year (the males possessing the red plumage assumed from the first moult to the end of that year). Many of the females killed by Mr. Selby showed plainly, from the denuded state of their breasts, that they had been engaged in incubation some time previous to their arrival; which circumstance, he observes, agrees with the account given of the early period at which they breed in higher latitudes. They continued in Britain till towards the autumn, but kept moving northward, for Mr. Selby found them in September particularly abundant in all the fir-tracts of Scotland after they had nearly disappeared south of the Tweed. Since that time (he writes in 1825) none had come under his observation. He alludes to the great havoc they commit in the apple and pear orchards in their occasional visits to the south, by splitting the fruit in halves for the sake of the enclosed pips. Mr. Hoy, of Stoke Nayland, in Suffolk, who gives an interesting account of the habits of these birds, says that from 1821 to the middle of May, 1822, Crossbills were very numerous in that county, and, he believes, extended their flights into many parts of England. (Loudon's *Magazine of Nat. Hist.*, January, 1834.) Mr. Knapp notices its occasional visits in small parties, and the damage it does to the orchard. He says that a pair was brought to him very early in August, and the breast of the female being nearly bare of feathers, as is observed in sitting birds, he thinks it is probable that she had a nest in the neighbourhood. There are a few instances recorded of its breeding here.

---

* Buffon's words are, 'Les deux pointes ne pouvant se rencontrer, l'oiseau ne peut ni becqueter, ni prendre de petits grains, ni saisir sa nourriture autrement que de côté.'

† But note: Mr. Gould, at a meeting of the Zoological Society of London, showed that the Crossbill of North America is very distinct from that of Europe, the Loxia curvirostra, Linn. It is one-third less in all its proportions, and is somewhat less brilliant in colouring. ('Zool. Proc.,' 1834.)

‡ Such is the prince's statement in the 'Specchio Comparativo;' but in his recent and valuable 'Geographical and Comparative List of the Birds of Europe and North America' (London, 1838), he corrects this, and, confining *Loxia curvirostra* to Europe generally, gives *Loxia Americana* as the American form.

Utility to Man.—The flesh of the Common Crossbill is well flavoured. Mr. Gould saw in the bird-market of Vienna multitudes of Crossbills exposed for sale with swallows, martins, and many others of the smaller birds, for the purposes of the table; of these the Crossbill appeared to be especially in request from its superiority of size and its sweet and well-tasted flesh, to the good qualities of which Mr. Gould bears testimony. The same author notices it as seeming to be of all the small birds the least distrustful of man, and states that when flocks arrive in this country numbers are taken by a bird-limed twig attached to the end of a fishing-rod.

Loxia curvirostra, male: upper figure, young of the year; lower, adult.

LOXODROMIC SPIRAL (λοξός, oblique, δρόμος, course), the curve on which a ship sails when her course is always on one point of the compass. It is called in English works the RHUMB LINE.

LOYOLA. [JESUITS.]

LOZÈRE, a department in the south of France, bounded on the north-east by the department of Haute-Loire, on the east by that of Ardèche, on the south-east and south by that of Gard, on the south-west and west by that of Aveyron, and on the north-west by that of Cantal. The form of the department is nearly oval; its greatest length is, from north-west to south-east, from the banks of the little river Bès, which separates this department from that of Cantal, to the neighbourhood of St. Jean de Gard [GARD], 64 miles; its greatest breadth is, from the banks of the Borne, which separates this department from that of Ardèche, to the junction of the Jonte and the Tarn, 57 miles. The area of the department may be estimated at 1992 square miles, being considerably under the average size of the French departments, and rather less than the English county of Norfolk. The population in 1831 was 140,347; in 1836 it was 141,733, showing an increase in five years of 1386, or less than one per cent., and giving 71 inhabitants to a square mile, less than one-half the average density of population in France, and about equal to the density of population in Westmoreland, the most thinly peopled of the English counties. Mende, the capital, is in 44° 31′ N. lat. and 3° 29′ E. long., 302 miles in a direct line south by east of Paris, or 335 miles by the road through Montargis, Nevers, Moulins, Clermont, and St. Flour.

The department is altogether of a mountainous character. The Cévennes cross it in the south-western part; Mont Lozère, one of the loftiest mountains of this range, is 4885 feet high (Malte Brun), and gives name to the department: the Roc de Malpertus in the immediate neighbourhood of Lozère (if indeed it be not one of the peaks of Lozère itself) is 5508 feet high. The chain of La Margeride, which branches off from the Cévennes at Mont Lozère, and unites that mountain-range with the volcanic group of Auvergne, extends through the department in the direction of its length; and the mountains of Aubrac overspread the eastern part, and extend into the adjacent department of Aveyron. The mountain-ranges of the Cévennes and La Margeride determine the watershed of the department, and divide it between three of the great river-basins of France. The small portion on the south-east, separated from the rest by the crests of the Cévennes, belongs to the basin of the Rhône; the rest of the department is divided by the mountains of La Margeride, between the basin of the Loire in the north and that of the Garonne in the west: the part comprehended in the basin of the Garonne is considerably larger than either of the others.

The department is chiefly occupied by the primitive rocks which constitute the mass of the Cévennes and the connected mountains. On the south-eastern slope of the Cévennes, towards the basin of the Rhône, the granites and other primitive rocks are covered with the strata of later formation which intervene between the chalk and the saliferous sandstone. The same strata overspread a considerable portion of the western side of the department on the banks of the Tarn and the Lot, and in the country between them. One or two extinct volcanoes have been observed within the limits of this department; but they are not so numerous as in the adjacent departments of Haute-Loire and Cantal.

The mineral wealth of the department is not great: lead, silver, antimony, copper, and iron ore are procured. There is not however any coal, nor are there any works for smelting or working iron. Marble, freestone for building, and gypsum, are quarried; and there are some mineral springs, of which the most frequented are those of Bagnols les Bains near Mende.

The rivers are all small in that part of their course which lies within the department. To the basin of the Rhône belong the Cèze, which rises in Mont Lozère, and brings down particles of gold; the Gardon d'Alais, the Gardon de Mialet, and the Gazizan, which unite their streams in the adjacent department of the Gard, on the eastern border of which all these rivers join the Rhône. The Chassezac and the Borne water the east side of the department, and flow by the Ardèche into the Rhône. To the basin of the Loire belong the Allier, which rises in the north-eastern slopes of La Margeride, and for some distance separates this department from the adjacent departments of Ardèche and Haute-Loire; the Chapeauroux and the Ance, which also rise on the same slope and flow northward into the Allier. To the basin of the Garonne belong the Lot and the Tarn. The Lot rises in the south-western slope of La Margeride, not far from Mont Lozère, and flows west by Mende and Chanac into the department of Aveyron: nearly 40 miles of its course belong to this department. It receives the Coulanges and some other small streams: the Coulagnet and some others fall into the Coulanges. The Trueyre, or Truyère, a more important tributary, rises in the slope of La Margeride, and flows north-west; it does not join the Lot till far beyond the boundary of this department. The Bès, a tributary of the Truyère, forms the boundary between the departments of Lozère and Cantal; it rises in that of Lozère. The Tarn rises on the western side of Mont Lozère and flows westward to Sainte Enimie, and then south-west into the department of Aveyron. In one part of its course (the Pas-de-Souci) the Tarn passes between two precipitous rocks which nearly meet over head and form a natural bridge. It receives the Tarnon, the Jonte, which separates the department of Lozère from that of Aveyron, and several smaller streams: about 45 to 48 miles of its course belong to this department.

Entirely destitute of inland navigation, the department is very indifferently provided with roads. There are five government roads, having an aggregate length of 239 miles; but of these only 88 miles were in 1837 in repair, 23 miles were out of repair, and 128 were unfinished. The principal road is that from Paris by Moulins and Clermont to Narbonne and Perpignan. It enters the department from that of Cantal on the north, and runs by St. Chely, Aumont, Marvejols, and Chirac into the department of Aveyron. The road from Paris to Mende branches off from this at St. Chely, and a branch road from Mende rejoins the great Perpignan road just before it leaves the department. Other roads run from Mende by Langogne to Le Puy (Haute Loire); by Villefort to Le Pont St. Esprit (Gard) on the Rhône; and by Ispanhac and Florac to Nîmes (Gard). A cross-road from Langogne leads by Villefort to Alais (Gard) and Nîmes (Gard).

The departmental roads are 21 in number, with an aggregate length of 370 to 380 miles; but more than two-thirds of the whole length are out of repair; the bye-roads and paths amount to nearly two thousand five hundred, with an aggregate length of more than 2000 miles.

The general elevation of the soil renders the climate colder than from the latitude would be otherwise expected. The mountains are covered with snow during a great part of the year. The western slopes of the Cévennes and mountains of La Margeride and the north-eastern slopes of the latter have a moist rainy atmosphere: on the south-eastern slope of the Cévennes there is less rain; and droughts of such length as to injure vegetation are not uncommon. The heat of summer in the department is rarely great; but tempests are frequent at that season. In the mountainous districts little grain is grown; and indeed throughout the department the quantity of arable land is less than usual in France, and the corn grown is insufficient for the consumption of the department. Chesnuts and potatoes, both which are much cultivated, form the principal food of the peasantry. Flax, hemp, and hay are grown. Many plants used in medicine, in tanning, or in dyeing, are found; among them is madder. On some of the steep slopes on the south-east side of the Cévennes the industry of some of the cultivators has succeeded in raising the olive, the vine, and the mulberry. The vineyards occupy from 2000 to 2500 acres. Woods occupy about a twelfth part of the surface; the beech is the principal forest-tree. The forests are infested by wolves. The meadow lands occupy about a fifteenth of the department; but the heaths and open wastes are very extensive, and serve for the pasturage of cattle, and of numerous flocks of sheep. Many mules are reared for carrying goods across the mountains, or for exportation to other parts of the south of France or to Spain. Game is abundant; and trouts and eels are numerous in the rivers and ponds.

The department is divided into three arrondissements, as follows:—

	Area in square miles.	Population in 1831.	1836.	Communes.
Mende, N.E. & E., . .	688	45,440	46,192	62
Florac, S., ...	646	41,525	41,439	51
Marvejols, N.W. & W., .	658	53,382	54,102	75
	1992	140,347	141,733	188

It is divided into 27 cantons, or districts under a justice of peace.

In the arrondissement of Mende are Mende and Le Bleymard on the Lot; Villefort near Mont Lozère; Langogne on the Allier; Châteauneuf de Randon on the Chapeauroux, and Grandrieu on a small river of the same name which joins the Chapeauroux. Mende is first mentioned by Gregory of Tours, who calls it Mimmate. It was formerly the capital of the province of Gevaudan. It is in a dreary and mountainous district; but the immediate neighbourhood of the town, which is in a valley watered by the Lot, is pleasant, being studded with gardens, meadows, and orchards, in which are apple and pear trees, producing excellent fruit, and many fine walnut-trees. The town occupies a site nearly triangular, and is at an elevation of above 1800 feet above the level of the sea. It is surrounded by a small boulevard. The streets are ill laid out, narrow, crooked, and dirty; the houses, which are roofed with slate, are ill built. The cathedral is a very inferior building; though its steeples are praised by some writers for the lightness and boldness of their architecture. The former episcopal palace, now the prefect's house, has a handsome gallery and saloon with some good paintings. There are several public fountains. Around the town are many small country-houses. The population of Mende was, in 1831, 4558 for the town, or 5822 for the whole commune; in 1836 it was 5909 for the commune. A considerable quantity of serge is manufactured in and about the town for exportation to foreign lands; there are two considerable yearly fairs. There are a high school, a public library, a theatre, and an agricultural society. There is in the immediate neighbourhood of Mende a mountain which rises to the height of 1020 feet above the town; on the slope of this mountain, more than half-way up, is the hermitage, the dwelling of St. Privas, hewn in the rock. About five miles east of the town are the warm sulphurous springs of Bagnols, which are in high repute for rheumatic and cutaneous disorders, and for wounds. It is estimated that 2000 invalids resort to them yearly. There is also at Lanuéjols, or La Nuéjols, near Mende, an antient tomb, erroneously supposed by some to be that of Munatius Plancus, who built Lyon. Pope Urban V. was born near Mende.

At Le Bleymard the manufacture of serges and other woollens is carried on. Villefort is the centre of a district in which wine and chesnuts are grown. Lead and copper mines are wrought in the neighbourhood, and trade is carried on in horses and cattle. At Langogne (pop. 2309 town, 2720 whole commune) much serge and other woollens are manufactured, and there are copper-works. Châteauneuf de Randon is a small town of perhaps 500 inhabitants; it has a good market. It was in besieging this little town, then (A.D. 1380) in the power of the English, that Bertrand du Guesclin died. The governor of this place, who had agreed, if not succoured, to surrender to him, laid the keys of the place on Du Guesclin's coffin.

In the arrondissement of Florac are Florac, on the Tarnon, a feeder of the Tarn; Pont de Montvert, Ispanhac, and Sainte Enimie on the Tarn; Meyrueis on the Jonte; and Barré and St. Germain near the highest ridge of the Cévennes. Florac is in a narrow valley, and consists chiefly of one street on the road which runs from Mende to Nîmes. The population in 1831 was 1796 for the town, or 2194 for the whole commune; in 1836 it was 2246 for the commune. There is little trade, but the neighbourhood of the town is fertile. Ispanhac, or Espagnac, is delightfully situated in a pleasant valley. Some cotton manufactures are carried on. At Sainte Enimie serges, like those of Mende, are manufactured. Near Meyrueis are some curious caverns, and some beds of coal, which are not worked.

In the arrondissement of Marvejols are Marvejols and Chirac, on the Coulanges; Balsièges on and La Canourgue near the Lot; Serverette and Malzieux on the Truyère; St. Alban on the Limaniol, a small feeder of the Truyère; St. Chely d'Apalche, on another small feeder of the Truyère; and Aumont between St. Chely and Marvejols.

Marvejols was taken in A.D. 1586 from the Huguenots, by the duke of Joyeuse, who commanded the troops of Henri III., and in violation of the capitulation the town was pillaged and burnt, and the walls were razed to the ground. Six years afterwards Henri IV. aided the inhabitants in rebuilding the place; it is now a well laid out and handsome town. It had before the Revolution several monastic establishments. The population in 1831 was 3796 for the town, and 3885 for the whole commune; in 1836 it was 4025 for the commune. There are several mills on the Coulanges, and some dye-houses. Serges and other woollens are manufactured at Balsièges, La Canourgue, Serverette, Malzieux, St. Alban, and St. Chely. Red granite is quarried near St. Alban; there is in the town a château now converted into an hospital for insane females. At St. Chely (pop. 1555 town, 1651 whole commune) are two weekly markets, at which a good deal of business is done in cattle: considerable trade is also carried on in woollen stuffs.

The chief manufacture of the department is that of serges and other woollen stuffs; spinning cotton-yarn is also carried on to some extent. Chestnuts are prepared for export in considerable quantity. But the different branches of industry are not sufficient to give employment to the inhabitants, a number of whom emigrate yearly to the more southern departments to obtain work as mowers and reapers. The trade of the department is trifling; the want of navigable rivers and the labour of the conveyance over the mountains are great impediments. The exports are cattle, chestnuts, and woollen stuffs.

The department constitutes the diocese of Mende, the bishops of which are suffragans of the archbishop of Alby. It is in the jurisdiction of the Cour Royale and the circuit of the Académie Universitaire of Nîmes. It is in the ninth military division, the head-quarters of which are at Montpellier. It returns three members to the Chamber of Deputies. In respect of education it is below the average of France; the number of young men enrolled in the military census of 1828-29 who could read and write was twenty-seven in every hundred, the average of France being thirty-nine.

This department formerly constituted the territory of the Gabali, a Celtic people. Their capital was Anderitum, afterwards called Gabali, from the name of the people, now Javols, a village between St. Chely and Mende. Several antiquities have been discovered at Javols, such as the ruins of columns, statues, and buildings; coins, medals, and vases. Traces of the Roman road from Lugdunum (Lyon) to Tolosa (Toulouse) have been observed in this department. Some of the Celtic monuments called dol mens are yet in existence.

Before the Revolution this department constituted for the most part the province of Gévaudan in Languedoc. Portions of the district of Le Velay and of the diocese of Uzès, both also in Languedoc, are included in the present limits.

LÜBECK is situated in 53° 51′ N. lat. and 10° 50′ E. long., on a long eminence between the rivers Trave and Wakenitz. Its territory is bounded on the east by Mecklenburg Strelitz, on the west by Oldenburg and Holstein, and on the south by Lauenburg; the northern part, between Holstein and Mecklenburg, extends to the Baltic. Its territorial possessions were formerly very scattered; some detached portions were in Holstein, some in Lauenburg, and others in Mecklenburg. By the decision of the diet in February, 1803, modified in 1804 by a treaty with Oldenburg, it obtained, in exchange for many of its distant districts, a continuous tract on the Trave. It is very uncertain at what time a town was first erected on this spot. There is evidence that a flourishing commercial town existed here in the eighth century, which was built by the Wilzen, a Vendish tribe, as a place of arms, on the banks of the Schwartau. This was Old Lübeck, which was however soon taken by the Obotriti, whose king, Henry, chose it for his residence. In 1138 the Rugians took the place and totally destroyed it, upon which Adolphus II., count of Holstein, founded the present city of Lübeck on the banks of the Trave in 1140. He peopled it with fugitives and settlers from Westphalia and the Netherlands, and merchants from Bardewick; but Henry the Lion, duke of Saxony, being jealous of the rapid rise of Lübeck, to the detriment of Bardewick, did his utmost to interrupt its commerce by land. In 1157 the city was nearly destroyed by fire. In 1158 Adolphus ceded it and its territory to Henry the Lion, who rebuilt the town, surrounded it with walls, gave it magistrates of its own, granted it several privileges, allowed the northern nations a free trade to it, and gave it the celebrated code of laws called *das Lübische Recht*, which was subsequently adopted by so many countries and cities. In 1163 the see of the bishopric of Oldenburg, founded in 952 by the Emperor Otho I., was transferred, at the instance of Bishop Gerold, to Lübeck. This proved a great advantage to the city. The churches of St. Mary and St. Peter were already built, and the cathedral was founded by Bishop Gerold in 1170. Henry the Lion being put under the ban of the empire, Lübeck was forced to submit to the emperor Frederick I., during whose absence in the Holy Land, Henry returned from England, and recovered it, but had held it only three years when it was taken by Adolphus III., count of Holstein (1192). Ten years later it was taken by Waldemar, brother of Canute, king of Denmark. The Danes proved very oppressive masters, and the citizens, taking advantage of some favourable circumstances, expelled the Danish garrison in 1226, and placed themselves under the protection of the emperor Frederick II., who confirmed all their privileges, and made Lübeck a free imperial city.

The citizens had many contests to maintain with their jealous and powerful neighbours, but their valour and prudence triumphed on every occasion. The wealth and power of Lübeck increased, and it joined the Hanseatic League, of which it became the head. [HANSE TOWNS.] Its fleets commanded the Baltic; Gustavus Vasa found an asylum in its walls against Christian II., and Lübeck's voice decided in the affairs of the kingdoms of the North. As an evidence of the prosperity of Lübeck during the flourishing period of the Hanseatic League, it may be stated that the dreadful pestilence called the 'black death' is said to have carried off in five months, in 1350, between 80,000 and 90,000 persons, without depriving the city of more than half of its population. This number is presumed however by some writers to be far above the truth; yet it appears that, 200 years later, in April, 1550, between 50,000 and 60,000 citizens able to bear arms were numbered, which would certainly imply a population of 200,000 souls. From the dissolution of the Hansa in 1630 to the present day, Lübeck has passed through numerous vicissitudes. The storms of the French revolution fatally affected Lübeck. The occupation of the city by Blücher after his retreat from the battle of Jena, and his brave but unsuccessful defence against 70,000 French soldiers, led to the plunder of the town during three days, when many of the defenceless citizens were murdered, and property to an immense amount was carried off or wantonly destroyed. Lübeck, like Hamburg, was incorporated with the French empire in 1810, and so remained till it recovered its freedom after the battle of Leipzig in 1813.

Lübeck, in its present state, is no longer a fortified town; the old ramparts are converted into public walks, and the city, being on a moderate eminence between the Trave and the Wakenitz, is very pleasantly situated, and is very clean and cheerful. The interior is more regular than in most of the old German towns, it being intersected by several broad and straight streets. The houses are built of stone. A great number of the houses are in the old-fashioned style, with the gable ends towards the street, but the more modern are in better taste. Besides the cathedral, which contains valuable paintings and remains of antiquity, there are five parish churches, of which that of St. Mary is celebrated as one of the finest Gothic churches in northern Germany. It is 340 feet long, and the middle nave 152 feet high (as stated by Zeitz) and 45 wide. The church contains valuable paintings by Holbein, Vandyck, Perugino, Aldegrever, and other masters, a very curious astronomical clock, a 'Dance of Death,' a fine organ, and a remarkable altar by Guillaume of Antwerp, &c. The other churches are much inferior to St. Mary's. Lübeck is celebrated for its charitable institutions, which are numerous and admirably conducted. The other public establishments and buildings are the gymnasium, the commercial institution, the patriotic society, the mechanics' school of design, the Roman Catholic chapel, the Calvinist church, and many others. The senate-house, an antient Gothic building, contains the hall where the deputies of the Hansa formerly met.

The territory which we have already described, including the detached district and those which it possesses in common with Hamburg [HAMBURG], is about 120 square miles in extent, with a population which may now be estimated at 46,500, that of the city being 26,000 at the most, that of Travemünde 1100, and of Bergedorff and its district 5300. The manufactures are of very various kinds, but none on a large scale.

The commerce of the city is beginning to be of considerable importance. It has 60 ships of its own, and the arrivals are above 900 annually. At the moment that this article is written, a question of vital importance is pending. Between Hamburg and Lübeck there has always been a great transit trade; the route is partly through the Danish territories, and has hitherto been free from all tolls. But in defiance of antient and still subsisting treaties between Denmark and the two cities, the Danish government has lately imposed a very heavy duty on all goods going from Hamburg to Lübeck, and *vice versâ*. It is singular that the duty on the first is fixed at double that on the second. It almost seems as if this were in a spirit of hostility to England, as the goods, chiefly British colonial produce and manufactured articles, sent from Hamburg to Lübeck, amount to above a million sterling annually, while the Russian and Swedish goods from Lübeck to Hamburg do not exceed 200,000*l*. The two cities have appealed to the diet of the German confederation, whose decision is anxiously expected. For some years past there has been a regular communication by steam-boats between Lübeck and St. Petersburg: the voyage is generally made in three and a half or four days. (Hassel, *Geog.*, vol. v.; Stein, *Geog.*; Zeitz, *Ansichten von Lübeck.*)

LÜBECK (Principality). [Oldenburg.]

LUBIENIETSKI (Latinized *Lubieniecius*). There are five persons of this name (one Andrew, two Christopher, and two Stanislaus), all distinguished in the Polish Socinian controversy. A list of their several writings may be found in Sandius, 'Bibl. Antitrin.,' Freistadt, 1684. The subject of the present article is Stanislaus the younger, son of Christopher, who was born at Cracow, August 23, 1623, and died in exile at Hamburg, May 18, 1675. He was minister of a church at Lublin, until driven out by the arm of power for his opinions. He died, as is stated, by poison; a fact borne out by the death of his two daughters, and the serious illness of his wife, after eating of the same dish, and by the neglect of the Hamburg magistracy to institute the investigation usual in cases of sudden death.

The theological works of Lubienietski are numerous, and may be found in Sandius, with the exception of the 'Historia Reformationis Polonicæ,' published in 1685, at Freistadt, with a Life prefixed. But the work which makes his reputation more European, and entitles him to a place here, is his 'Theatrum Cometicum.' This work was published at Amsterdam in 1667 (Sandius and Weidler), but a copy in our possession has a Leyden title-page, and the date 1681. This change of titles in different parts of the same edition was formerly not uncommon, and has caused much confusion. A pictorial frontispiece has the following anagram for Stanislaus Lubieniecius: 'Satis in ulna Jesu lucebis.'

The 'Theatrum Cometicum' consists of three parts. The first contains the correspondence of the author with men of science throughout Europe on the subject of the comets of 1664 and 1665; and has in it communications from Vossius, Oldenburg, Hevelius, Kircher, Bouillaud, Von Guericke, &c. &c. The second part contains an elaborate account of all the comets (415 in number) recorded in history down to the year 1665. It is written in support of the hypothesis that comets portend both good and evil, in opposition to the prevailing notion that they were harbingers of misfortune only; and this opinion is supported by history, it being clearly shown that public events of both characters usually followed close upon comets. Thus he points out that though the comet of 323 strengthened the heresy of Arius, it also brought about the council of Nice; and this, from Lubienietski, was not a little satirical. We are in doubt whether to conclude that the author maintained his hypothesis in good faith, or to suspect that he chose his line of argument as the best practical mode of attacking the prevailing terrors. And our doubt becomes stronger when we see that in the third part, called 'Theatri Cometici exitus,' he rather widens his hypothesis; and whereas he had before maintained that comets foretell both good and evil, he now asserts the dilemma that they predict *both or neither*, but still cautiously.

In the late discussions about Halley's comet this work of Lubienietski was freely cited in proof of one and another former appearance, or presumed appearance, of that memorable body. It seems to have been taken for granted that the mere mention of a comet by this author is sufficient evidence of its having really appeared. It may be useful therefore on future occasions to recommend those who would prove a comet from the 'Theatrum Cometicum' (and the same caution may be given with respect to Riccioli's list), first to examine the authority on which the fact rests. Lubienietski has collected every instance, and gives his originals; but this, though done with care and great learning (exhibiting a mass of research which will appear wonderful when we remember that the investigator was driven from country to country, and engaged in continual theological controversy), should only serve to enable the reader to discriminate. Many of the authorities cited are worthless, and it even happens that the original historian of one of Lubienietski's comets was born many hundred years after the phenomenon for the appearance of which he is made sufficient evidence.

LUBLIN, a woiwodschaft, or province, of the kingdom of Poland, is composed of the circles of Lublin, Chelm, Josefow, and Zamoski, which formerly belonged to the kingdom of Galicia, and were ceded by Austria in 1810 to the grand-duchy of Warsaw. It lies between 50° 17′ and 51° 43′ N. lat., and 21° 45′ and 24° 7′ E. long., comprising an area of 6650 square miles, with a population of 500,000 inhabitants. It is bounded on the north by Podlachia, on the east by Russia, on the south by Galicia, and on the west by Sandomir. The Vistula separates it from Sandomir, the Bug from Russia, and the Wieprz (which flows through it) for some distance from Podlachia. This province has extensive forests, and in some parts morasses, but likewise contains tracts of good arable land, and pasturage with a fine breed of cattle. There are no metals except bog-ore. It is divided into four circles (in Polish *obwod*), viz. Lublin, Zamosz, Hrubieszow, and Krasnistaw.

The principal towns in the circle of Lublin, besides the capital, are the following: Lubartow, on the Wieprz, has a fine castle, three churches, a Capuchin convent, and 3190 inhabitants. Kurow, on the Kurowka, has a fine palace of Count Potocki, two churches, and 1920 inhabitants. In 1816 a mineral spring was discovered, the waters of which resemble those of Pyrmont: Pulawy, on the Vistula, was once the residence of Prince Czartoryski, whose splendid palace, with its library of 60,000 volumes, many MSS., a collection of rare Polish antiquities, and countless treasures of art, was celebrated throughout Europe. The park was the finest in Poland, with the famous temple of the Sibyl, the country-seats of Marynke and Parchatka, and the Dutch dairy-farm in an island of the Vistula, the banks of which were covered with pretty country-houses. Such was Pulawy, but all is now desolate; the Russians laid the whole waste in 1831, during the ill-fated Polish revolution, when its treasures of art were destroyed, despoiled, or carried away, the estate confiscated, and the noble owner driven into exile. Zamosz, the capital of the circle of that name, a very strong fortress, is situated on the Wieprz. It was founded in 1588 by John Zamoyski, after his victory over the archduke Maximilian of Austria. The houses were built in the Italian style; and a high school with a considerable library, which was long celebrated, was founded in 1605. The Cossacks and Swedes besieged it without success. On the partition of Poland, it fell to the share of Austria. In 1[illegible] the Poles took it; and in 1813 the Russians. In 1820 the Polish state bought the town and environs of Count Stanislaus Zamoyski, who received for it above fifty estates belonging to the state. Hereupon the place was still more strongly fortified, and was deprived of its extensive suburbs. It has however still above 4000 inhabitants, with the fine extensive palace of Count Zamoyski, several considerable buildings, among which are the arsenal, four churches, the town-hall, two convents, and a theatre. All the learned institutions are abolished. Hrubieszow, situated on the Hulzwa, in the midst of marshes, has three churches, a convent, and 3900 inhabitants. Krasnistaw, on the W[illegible] and a lake, is a walled town; it has a palace, formerly the see of the Romish bishop of Chelm, who now resides at Lublin, several churches, and 2952 inhabitants, among whom are many Jews. Chelm, in this circle, the see of a Greek bishop, has a castle on a high hill, several Greek and Romish churches, a Piarist college, a gymnasium, and 2000 inhabitants.

LUBLIN, the capital of the government and of the circle, is in 51° 16′ N. lat. and 22° 30′ E. long. It is situated on an eminence on the river Bystricza, and is surrounded with walls, ditches, and great lakes; it is divided into the upper and lower town, of which the latter is chiefly inhabited by Jews. It has a dilapidated castle on a hill, and is the seat of a bishop and court of appeal. The most considerable buildings are the fine town-hall, eighteen churches, of which the cathedral, dedicated to St. Michael, and the churches of the Ex-Jesuits, the Visitandines, the Dominicans, and the Carmelites, are worthy of notice; there are twelve monks' and six nuns' convents (some of which have been suppressed), a Piarist college, a synagogue, a gymnasium, an academy of sciences, an agricultural society, and several hospitals and charitable institutions. The town has three annual fairs, which were frequented by great numbers of German, Greek, Russian, Armenian, and Turkish merchants, and it had a great trade in woollen cloth, corn, and Hungarian wines; but the late events have doubtless had an injurious effect on the trade of the town, season it may be cut four or five times. After each cutting it is useful to draw heavy harrows over the land, or an instrument made on purpose resembling harrows, the teeth of which are flat, and cutting the soil like small coulters. It will not injure the plants, even if it divide the crown of the root, but it will destroy grass and weeds. Liquid manure which consists of the urine of cattle and drainings of dunghills is often spread over the lucern immediately after it has been mown, and much invigorates the next growth; but if the land is rich to a good depth, this is scarcely necessary. The lucern will grow and thrive from seven to twelve years, when it will begin to wear out, and, in spite of weeding, the grass will get the upper hand of it. It should then be ploughed up, all the roots carefully collected and laid in a heap with dung and lime to rot, and a course of regular tillage should succeed. The same land should not be sown with lucern again in less than ten or twelve years, after a regular course of cropping and manuring.

Cattle fed upon lucern thrive better than on any other green food. Horses, in particular, can work hard upon it without any corn, provided it be slow work. Cows give plenty of good milk when fed with it. In spring it is apt to purge cattle, which, with a little attention, is conducive to their health. If it is given to them in too great quantities, or moist with dew, they run the risk of being hoven. These inconveniences are avoided by giving it sparingly at first, and always keeping it twenty-four hours after it is cut, during which time it undergoes an incipient fermentation, and the juice is partially evaporated: instead of being less nutritive in this state, it is rather more so.

An acre of good lucern will keep four or five horses from May to October, when cut just as the flower opens. If it should get too forward, and there be more than the horses can consume, it should be made into hay; but this is not the most profitable way of using it, and the plant, being very succulent, takes a long time in drying. The rain also is very injurious to it in a half-dry state; for the stem is readily soaked with moisture, which is slow in evaporating. The produce in hay, when well made, is very considerable, being often double the weight of a good crop of clover hay.

Many authors recommend drilling the seed of lucern in wide rows, and hoeing the intervals after each cutting. This is the best way with a small patch in a garden, and when only a little is cut every day; but in a field of some extent, the lucern, when once well established and preserved free from weeds by hand-weeding the first year, will keep all weeds down afterwards, and the heavy harrows with sharp tines, used immediately after mowing, will pull up all the grass which may spring up. No farmer ought to neglect having a few acres in lucern on his best land.

LUCERNA'RIA, a genus of soft zoophyta, established by Müller (*Zoologia Danica*). It is much allied to Actinia, Linn., and includes one or perhaps two living species from the North Sea and English Channel. [ZOANTHARIA.]

LUCIA, SAINT, one of the Lesser Antilles, situated in 13° 50′ N. lat. and 60° 58′ W. long., about 40 miles north of St. Vincent. Its extreme length from north to south is 32 miles, and its extreme breadth about 12 miles. This island is of volcanic origin, and several of the mountains terminate at their summits in craters of extinct volcanoes. One of these, called La Souffrière, at the south-west side of the island, has the appearance of a vast lime-pit, and some severe earthquakes, which are still remembered, are attributed to the convulsions within this mountain. Saint Lucia comprises two districts: of one of these, Basseterre, the lowest part is well cultivated, but abounds in swamps and marshes, which have a bad effect on the health of the inhabitants. The other district, called Capisterre, consists of a succession of abrupt fantastically shaped mountains, covered to their summits with forest-trees and underwood, and intersected by numerous ravines containing stagnant water and masses of vegetable matter in every stage of decomposition. Under these circumstances it may well be believed that this island is very unhealthy. It appears from a Report drawn up by Captain Tulloch, of the War-office, and presented to parliament, on the sickness and mortality among the troops in the West Indies, that in the twenty years from 1817 to 1836 the average number of deaths in each year out of each 1000 white soldiers stationed at St. Lucia was 122. The greatest number of deaths occurred in 1822, when 392 out of every 1000 were carried off; the smallest number, 56 in 1000, occurred in 1832. The deaths among the black troops during the same twenty years did not average more than 43 in each 1000, and varied from 75 in 1819 to 12 in 1827. The fort in which the greater part of the troops are stationed is on the summit of a steep hill called Morne Fortuné, about 850 feet above the level of the sea, and having many swamps in the low land in the neighbourhood.

Castries, the only town on the island, lies at the bottom of a long winding bay in a low marshy spot, surrounded by an amphitheatre of hills, which greatly impede ventilation.

The population of the island in 1836 consisted of—

	Males.	Females.	Total.
Whites . .	503	487	990
Coloured persons	6,645	7,695	14,340
Aliens and resident strangers		. .	786
		Total .	16,116

Of this number about 3300 reside in the town, the rest are located on the plantations throughout the cultivated part of the island. The chief productions are sugar, coffee, and cocoa. In 1835 there were produced of these articles—from 4,087 acres planted with sugar-cane, 5,861,379 lbs. of sugar, 144,684 gallons of molasses, and 101,028 gallons of rum; from 460 acres planted with coffee, 104,888 lbs.; and from 199 acres planted with cocoa, 38,908 lbs.

There were besides 5522 acres cultivated as provision grounds, and 5090 acres of pasture land. The number of stock consisted of 736 horses, 2511 horned cattle, 1668 sheep, and 692 goats.

The total value of imports in 1835 was 51,807*l.*, about three-fourths of which consisted of British manufactures, and about one-fourth of maize, salt fish, and lumber. The exports in the same year were valued at 79,872*l.*, and consisted of the above-mentioned kinds of produce.

St. Lucia is so called from having been first discovered on St. Lucia's day. This was about the year 1635, when a settlement was attempted by a party of English, who were soon after driven off by the Carribs. About 1650, the French effected a settlement. The island was taken in 1664 by the English, but was evacuated by them in 1666, when the French immediately returned, but were in turn driven out by the Carribs. In 1718 the French again succeeded in forming a settlement, and its possession was again disputed by the English. In 1731 the two nations agreed that the island should be evacuated by both. In 1765 England gave up all claim to possession in favour of France, with which country it remained till 1779, when it was taken by the English, but it was restored at the peace of 1783. In 1794 the English again took it, but in the following year the French inhabitants rose upon and overpowered the garrison, and kept possession until May, 1796, when the island was again taken by General Abercromby. At the peace of Amiens it again reverted to France, but was taken once more in 1804 by the English, and has since remained subject to the British crown.

The government is administered by a lieutenant-governor and an executive council. The French laws are nominally in force, but being dispensed by English functionaries, are made to give place to the English practice whenever an adherence to the French code would be contrary thereto.

LUCIAN (Λουκιανός), a celebrated Greek writer, was born at Samosata, a city on the west bank of the Euphrates, in the Syrian province of Commagene. We possess no particulars respecting his life on which any reliance can be placed, except a few scattered notices in his own writings. From these it appears that he was born about the latter end of Trajan's reign, that he lived under both the Antonines, and died in the reign of Aurelius Commodus, or shortly afterwards. His parents, who were in humble circumstances, placed him with his maternal uncle, a sculptor, in order to learn statuary; but he soon quitted this trade, and applied himself to the study of the law. He afterwards practised at the bar in Syria and Greece; but not meeting with much success in this profession, he resolved to settle in Gaul as a teacher of rhetoric, where he soon obtained great celebrity and a numerous school. He appears to have remained in Gaul till he was about forty, when he gave up the profession of rhetoric, after having acquired considerable wealth. The greater part, if not all, of his dialogues appear to have been written after this time; but most of his other pieces, such as his 'Hercules,' 'Hesiod,' 'Herodotus,' 'Zeuxis,' 'Bacchus, the 'Dipsades,' &c., were probably written during the time that he taught rhetoric in Gaul. During the

LUCCA, the capital of the duchy, is situated in a rich plain watered by the Serchio, and surrounded by mountains: it is twelve miles from the sea, and about ten miles north-east of Pisa; its circumference is a little more than three miles, and it contains 22,000 inhabitants. Lucca is surrounded by ramparts, which are planted with trees, and form a very pleasant promenade. The town is well-built, and is supplied with good water, and the streets are well paved and clean.

Lucca, like most other Italian cities, is rich in churches: the cathedral, which belongs to the eleventh century, is adorned with several good paintings, and still more with statues and monuments by the native sculptor Civitali. The archiepiscopal archives and those of the chapter contain a vast mass of historical documents, parchments, and MSS., some as old as the seventh century, the oldest probably in Italy. The other remarkable churches of Lucca are, St. Frediano, which has some fine Roman columns; St. Francesco, with the tomb, indicated by a simple inscription on the wall, of the greatest man that Lucca has produced, Castruccio Castracani; St. Cristoforo, with the tomb of the sculptor Civitali; St. Michele; St. Paolino; St. Giovanni, with its baptistery; St. Maria in Corte Landini, which contains several good paintings; the annexed convent belongs to the 'Chierici Regolari della Madre di Dio,' an order founded at the end of the sixteenth century by Giovanni Leonardi, a native of Lucca, which has produced many learned men. It has a library of 20,000 volumes. The ducal palace is vast, but unfinished; it has a gallery of valuable paintings by the great masters, and a library of 25,000 volumes. The palazzo Pretorio, or town-house, which belongs to the fifteenth century, is a massive sombre building. The palace Guidiccioni, where the public archives are kept, and that of the Marquis Bernardini, are also worthy of notice.

The academy of letters and sciences of Lucca, instituted in 1817, which consists of thirty-six members, holds its meetings once a month in a hall of the Lyceum, and has published several volumes of 'Atti,' or memoirs. The duke is perpetual president.

Lucca ('Luca') is mentioned in antient history as a town belonging to the Etruscans after they had conquered the country between the Arno and the Macra and taken it from the Ligurians. It afterwards became a Roman colony. There are still remains of a Roman theatre, and of an amphitheatre.

Lucca in the middle ages was a republic, often at war with Pisa and Florence. It was at one time with Pisa at the head of the Guibeline party [CASTRUCCIO CASTRACANI]; it afterwards fell under the yoke of the Visconti of Milan, was restored to its liberty by the emperor Charles IV. in 1370, was subject successively to several tyrants, and at last settled gradually into a narrow aristocracy. One of its citizens, Burlamacchi, about 1546, being made gonfalonière, attempted a revolution for the purpose of restoring the popular government, not only at Lucca, but in all the other Tuscan cities. Being discovered, he was arrested and given up to the imperial governor of Milan, who put him to death. [BURLAMACCHI, FRANCESCO.] In 1556 a law was passed at Lucca, on the proposal of the gonfalonière Martino Bernardini, by which only a certain number of families were eligible to office: this law, which was called 'Martinian,' established a close aristocracy like that of Venice. In 1600 the privileged families were 160; in 1797 they were reduced to 88, the others having become extinct. From among these families was elected a 'Signoria,' or executive of nine 'Anziani,' or elders, and a gonfalonière, a senate of 36 members, and a great council of 90. In this manner Lucca was administered for more than two centuries in peaceable obscurity. In 1799 the French, under General Serrurier, entered Lucca, placed a garrison in it, emptied the arsenal, carried away all the brass cannon from the ramparts, and exacted two millions of francs, besides supplies of provisions, professing all the time to have the greatest regard for the antient republic of Lucca. Meantime the democratic party, supported by the French, demanded a change in the form of government; the Martinian law was abolished, and a constitution after the then prevalent fashion, with two councils and a directory, was proclaimed. In 1805 Napoleon, having re-established monarchy both in France and Italy, gave Lucca to his sister Eliza as a principality, with new constitutional laws.

In 1814 the Congress of Vienna gave Lucca to Maria Luisa of Spain and her son, the widow and child of the Prince of Parma; the latter duchy being given to Maria Louisa of Austria, Napoleon's consort, for her life. It was also stipulated that after the death of Maria Louisa, the present duchess of Parma, the duke of Lucca should have again his ancestral duchy of Parma and Piacenza, and Lucca should be united to the grand-duchy of Tuscany, with which, geographically speaking, it is naturally connected. (Valéry, *Voyages en Italie*; Botta, *Storia d'Italia*; *Memorie e Documenti per servire all' Istoria del Ducato di Lucca*, 4 vols. 8vo., Lucca, 1818; Lucchesini, *Storia Letteraria di Lucca.*)

LUCERN. [LUZERN.]

LUCERN (*Medicago sativa*), a plant of the Linnæan class Diadelphia and order Decandria, with a papilionaceous flower, and of the natural family of the Leguminosæ. There are many species of the Medicago, of which one is supereminent as an artificial grass in temperate climates, and a most valuable plant for feeding cattle. It was in high repute among the antients. The authors *De Re Rustica* speak of it with enthusiasm, and all over the continent of Europe, wherever husbandry has made any progress, it is in high reputation. Lucern is a plant which will not bear extreme frost nor superabundant moisture, and its cultivation is therefore restricted to mild climates and dry soils; but where it thrives, its growth is so rapid and luxuriant, that no other known plant can be compared to it. In good deep loams lucern is the most profitable of all green crops; when properly managed, the quantity of cattle which can be kept in good condition on an acre of lucern, during the whole season, exceeds belief. It is no sooner mown than it pushes out fresh shoots, and wonderful as the growth of clover sometimes is in a field which has been lately mown, that of lucern is far more rapid. Where a few tufts of lucern happen to be, they will rise a foot above the surface, while the grass and clover, which were mown at the same time, are only a very few inches high.

Lucern, sown in a soil suited to it, will last for many years, shooting its roots downwards for nourishment till they are altogether out of the reach of drought. In the dryest and most sultry weather, when every blade of grass droops for want of moisture, lucern holds up its stem, fresh and green as in a genial spring. The only enemies of this plant are a wet subsoil and a foul surface. The first is often incurable; the latter can be avoided by good cultivation.

It is useless to sow lucern on very poor sands or gravel, or on wet clays. The best and deepest loam must be chosen, rather light than heavy, but with a good portion of vegetable earth or humus equally dispersed through it. If the ground has been trenched, so much the better; and if the surface is covered with some inferior earth from the subsoil, it will be no detriment to the crop, for it will prevent grass and weeds from springing up, and save much weeding. The lucern will soon strike down below it. It is not a bad practice to cover the lucern-field with a coat of coal-ashes or poor sand, merely to keep down the weeds, where this can easily be done.

The soil in which it is intended to sow lucern-seed should be well prepared. It should be highly manured for the two or three preceding crops, and deeply ploughed if not trenched. It should be perfectly clean, and for this purpose two successive crops of turnips are most effectual. The turnips should be fed off with sheep. In the month of March, the land having been ploughed flat and well harrowed, a very small quantity of barley, not above a bushel to the acre, may be sown, or rather drilled on the ground, and at the same time from 30 to 40 lbs. of lucern-seed sown broad-cast, and both harrowed in and lightly rolled. If the land will not bear to be laid flat without water-furrows, it will be useless to sow lucern in it.

As the crop comes up it must be carefully weeded: no expense must be spared to do this effectually, for success depends upon it. When the barley is reaped, the stubble, which will probably be strong, should be pulled up by the hand-hoe, or by harrowing, if the plants of lucern be strong, and, at all events, the ground must be cleared of weeds. It must not be fed off with sheep; they would bite too near the crown. Lucern should always be cut as soon as the flower is formed. If it is kept clear of weeds the first year, there will be little difficulty with it afterwards, when the roots have become strong. The second year the lucern will be fit to cut very early, and in a favourable season it may be cut four or five times. After each cutting it is useful to draw heavy harrows over the land, or an instrument made on purpose resembling harrows, the teeth of which are flat, and cutting the soil like small coulters. It will not injure the plants, even if it divide the crown of the root, but it will destroy grass and weeds. Liquid manure which consists of the urine of cattle and drainings of dunghills is often spread over the lucern immediately after it has been mown, and much invigorates the young shoots; but if the land is rich to a good depth, this is scarcely necessary. The lucern will grow and thrive from seven to twelve years, when it will begin to wear out, and, in spite of weeding, the grass will get the upper hand of it. It should then be ploughed up, all the roots carefully collected and laid in a heap with dung and lime to rot, and a course of regular tillage should succeed. The same land should not be sown with lucern again in less than ten or twelve years, after a regular course of cropping and manuring.

Cattle fed upon lucern thrive better than on any other green food. *Horses*, in particular, can work hard upon it without any corn, provided it be slow work. *Cows* give plenty of good milk when fed with it. In spring it is apt to purge cattle, which, with a little attention, is conducive to their health. If it is given to them in too great quantities, or moist with dew, they run the risk of being hoven. These inconveniences are avoided by giving it sparingly at first, and always keeping it twenty-four hours after it is cut, during which time it undergoes an incipient fermentation, and the moisture is partially evaporated: instead of being less nutritive in this state, it is rather more so.

An acre of good lucern will keep four or five horses from May to October, when cut just as the flower opens. If it should get too forward, and there be more than the horses can consume, it should be made into hay; but this is not the most profitable way of using it, and the plant, being very succulent, takes a long time in drying. The rain also is very injurious to it in a half-dry state; for the stem is readily soaked with moisture, which is slow in evaporating. The produce in hay, when well made, is very considerable, being often double the weight of a good crop of clover hay.

Many authors recommend drilling the seed of lucern in wide rows, and hoeing the intervals after each cutting. This is the best way with a small patch in a garden, and where only a little is cut every day; but in a field of some extent, the lucern, when once well established and preserved free from weeds by hand-weeding the first year, will keep all weeds down afterwards, and the heavy harrows with sharp tines, used immediately after mowing, will pull up all the grass which may spring up. No farmer ought to neglect having a few acres in lucern on his best land.

LUCERNA'RIA, a genus of sea zoophyte, established by Müller (*Zoologia Danica*). It is much allied to Actinia, and includes one or perhaps two living species from the North Sea and English Channel. [ZOANTHARIA.]

LUCIA, SAINT, one of the Lesser Antilles, situated in 13° 50' N. lat. and 60° 58' W. long., about 40 miles north of St. Vincent. Its extreme length from north to south is 32 miles, and its extreme breadth about 12 miles. This island is of volcanic origin, and several of the mountains terminate at their summits in craters of extinct volcanoes. One of these, called La Soufrière, at the south-west side of the island, has the appearance of a vast lime-pit, and some severe earthquakes, which are still occasional, are attributed to the convulsions within this mountain. Saint Lucia comprises two districts: of one of these, Basseterre, the lowest part is well cultivated, but abounds in swamps and marshes, which have a bad effect on the health of the inhabitants. The other district, called Capisterre, consists of a succession of abrupt fantastically shaped mountains, covered to their summits with forest-trees and underwood, and intersected by numerous ravines containing stagnant water and masses of vegetable matter in every stage of decomposition. Under these circumstances it may well be believed that this island is very unhealthy. It appears from a Report drawn up by Captain Tulloch, of the War-office, and presented to parliament, on the sickness and mortality among the troops in the West Indies, that in the twenty years from 1817 to 1836 the average number of deaths in each year out of each 1000 white soldiers stationed at St. Lucia was 122. The greatest number of deaths occurred in 1825, when 292 out of every 1000 were carried off; the smallest number, 38 in 1000, occurred in 1832. The deaths among the black troops during the same twenty years did not average more than 41 in each 1000, and varied from 75 in 1819 to 12 in 1827. The fort in which the greater part of the troops are stationed is on the summit of a steep hill called Morne Fortuné, about 850 feet above the level of the sea, and having many swamps in the low land in the neighbourhood.

Castries, the only town on the island, lies at the bottom of a long winding bay in a low marshy spot, surrounded by an amphitheatre of hills, which greatly impede ventilation.

The population of the island in 1836 consisted of—

Of this number about 3000 reside in the town, the rest are located on the plantations throughout the cultivated part of the island. The chief productions are sugar, coffee and cocoa. In 1836 there were produced of those articles—from 4,087 acres planted with sugar-cane, 5,981,275 lbs. of sugar, 144,984 gallons of molasses, and 101,048 gallons of rum; from 466 acres planted with coffee, 164,889 lbs.; and from 192 acres planted with cocoa, 39,308 lbs.

There were besides 5322 acres cultivated as provision grounds, and 5090 acres of pasture land. The number of stock consisted of 736 horses, 2511 horned cattle, 1608 sheep, and 692 goats.

The total value of imports in 1836 was 51,807*l.*, about three-fourths of which consisted of British manufactures, and about one-fourth of maize, salt fish, and lumber. The exports in the same year were valued at 75,877*l.*, and consisted of the above-mentioned kinds of produce.

St. Lucia is so called from having been first discovered on St. Lucia's day. This was about the year 1639, when a settlement was attempted by a party of English, who were soon after driven off by the Caribs. About 1650, the French effected a settlement. The island was taken in 1663 by the English, but was evacuated by them in 1666, when the French immediately returned, but were in turn driven out by the Caribs. In 1718 the French again succeeded in forming a settlement, and its possession was again disputed by the English. In 1731 the two nations agreed that the island should be evacuated by both. In 1763 England gave up all claim to possession in favour of France, with which country it remained till 1779, when it was taken by the English, but it was restored at the peace of 1783. In 1794 the English again took it, but in the following year the French inhabitants rose upon and overpowered the garrison, and kept possession until May, 1796, when the island was again taken by General Abercromby. At the peace of Amiens it again reverted to France, but was taken once more in 1803 by the English, and has since remained subject to the British crown.

The government is administered by a lieutenant-governor and an executive council. The French laws are nominally in force, but being dispensed by English functionaries, are made to give place to the English practice whenever an adherence to the French code would be contrary thereto.

LUCIAN (Λουκιανός), a celebrated Greek writer, was born at Samosata, a city on the west bank of the Euphrates, in the Syrian province of Commagene. We possess no particulars respecting his life on which any reliance can be placed, except a few scattered notices in his own writings. From these it appears that he was born about the latter end of Trajan's reign, that he lived under both the Antonines, and died in the reign of Aurelius Commodus, or shortly afterwards. His parents, who were in humble circumstances, placed him with his maternal uncle, a sculptor, in order to learn statuary; but he soon quitted this trade, and applied himself to the study of the law. He afterwards practised at the bar in Syria and Greece; but not meeting with much success in this profession, he resolved to settle in Gaul as a teacher of rhetoric, where he soon obtained great celebrity and a numerous school. He appears to have remained in Gaul till he was about forty, when he gave up the profession of rhetoric, after having acquired considerable wealth. The greater part, if not all, of his dialogues appear to have been written after this time; but most of his other pieces, such as his 'Hercules,' 'Hesiod,' 'Herodotus,' 'Zeuxis,' 'Bacchus,' the 'Dipsades,' &c., were probably written during the time that he taught rhetoric in Gaul. During the remainder of his life we find him travelling about from place to place, and visiting successively Macedonia, Cappadocia, Paphlagonia, and Bithynia. The greater part of his time however was passed in Athens, where he lived on terms of the greatest intimacy with Demonax, a philosopher of great celebrity, and where most of his works were probably written. Towards the latter part of his life he held a lucrative public office in Egypt, which was bestowed upon him by the emperor Commodus. The account of his being torn to death by dogs, for having attacked the Christian religion, rests on no credible authority, and was probably invented either by Suidas or some other Christian writer of similar character.

The dialogues of Lucian are written in remarkably pure and elegant Greek, and are free from the false ornaments and artificial rhetoric which characterise most of the writings of his contemporaries. Modern critics have usually given him his full meed of praise for these excellencies, and have also deservedly admired the keenness of his wit, his great talent as a writer, and the inimitable ease and flow of his dialogue; but they have seldom done him the justice he deserves. They have either represented him as merely a witty and amusing writer, but without any further merit; or else they have attacked him as an immoral and infidel author, whose only object was to corrupt the minds of his readers, and to throw ridicule upon all religion. But these opinions appear to us to have arisen from a mistaken and one-sided view of the character of Lucian. He seems to us to have endeavoured to expose all kinds of delusion, fanaticism, and imposture; the quackery and imposition of the priests, the folly and absurdity of the superstitious, and especially the solemn nonsense, the prating insolence, and the immoral lives of the philosophical charlatans of his age. (See his *Alexander*.) Lucian may, in fact, be regarded as the Aristophanes of his age, and, like the great comic poet, he had recourse to raillery and satire to accomplish the great objects he had in view. His study was human character in all its varieties, and the age in which he lived furnished ample materials for his observation. Many of his pictures, though drawn from the circumstances of his own times, are true for every age and country. As an instance of this we mention the essay entitled 'On those who serve the Great for Hire.' If he sometimes discloses the follies and vices of mankind too freely, and occasionally uses expressions which are revolting to our ideas of morality, it should be recollected that every author ought to be judged of by the age in which he lived, and not by a standard of religion and morality which was unknown to the writer. The character of Lucian's mind was decidedly practical; he was not disposed to believe anything without sufficient evidence of its truth; and nothing that was ridiculous or absurd escaped his raillery and sarcasm. The tales of the poets respecting the attributes and exploits of the gods, which were still firmly believed by the common people of his age, were especially the objects of his satire and ridicule in his dialogues between the gods and in many other of his works. That he should have attacked the Christians in common with the false systems of the Pagan religion will not appear surprising to any one who considers that Lucian probably never took the trouble to inquire into the doctrines of a religion which was almost universally despised, in his time, by the higher orders of society. Lucian's statements have sometimes had an historical value assigned to them which he does not appear to have intended: the story of Herodotus reading his history at the Olympic games is one of these. [HERODOTUS.] Lucian had a taste for art, which he has shown by his descriptions in his 'Aetion,' 'Zeuxis,' 'Eikones,' &c.

The best editions of Lucian's works are by Hemsterhusius, who only edited part of the first volume, and Reiz (4 vols. 8vo.), by Lehmann (Leip., 9 vols. 8vo.), and the edition published by the Bipont Society; the best translation of Lucian in German is by Wieland (6 vols. 8vo.); there is an English translation by Tooke (Lond., 2 vols. 4to., 1820).

LUCIAN, SAINT, presbyter of Antioch, is said by some writers, but without sufficient authority, to have been born at Samosata; he suffered martyrdom during the reign of Diocletian, A.D. 312, and was buried at Helenopolis in Bithynia. He is frequently mentioned by ecclesiastical writers as a man of great learning and piety. Eusebius calls him a 'person of unblemished character throughout his whole life' (*Hist. Eccl.*, viii. 13); and Chrysostom, on the anniversary of Lucian's martyrdom, pronounced a panegyric upon him which is still extant. Jerome informs us, in his 'Catalogue of Ecclesiastical Writers' (c. 77), that 'Lucian was so laborious in the study of the Scriptures, that in his own time some copies of the Scriptures were known by the name of Lucian;' and we learn from another part of his works (*Præf. in Paralip.*, vol. i., p. 1023), that Lucian's revision of the Septuagint version of the Old Testament was generally used by the churches from Constantinople to Antioch. Lucian also made a revision of the New Testament, which Jerome considered inferior to his edition of the Septuagint.

There were extant in Jerome's time some treatises of Lucian concerning faith, and also some short epistles; but none of these have come down to us, with the exception of a few fragments.

There has been considerable dispute among critics respecting Lucian's belief in the Trinity. From the manner in which he is spoken of by most of the Trinitarian Fathers, and from no censure being passed upon his orthodoxy by Jerome and Athanasius, it has been maintained by some that he must have been a believer in the Catholic doctrine of the Trinity; but on the other hand Epiphanius, in his 'Anchoret' (xxxv., vol. ii., p. 40, D), speaks of the Lucianists and Arians as one sect; and Philostorgius (who lived about A.D. 425, and wrote an account of the Arian controversy, of which considerable extracts are preserved by Photius) expressly says that Eusebius of Nicomedia and many of the principal Arians of the fourth century were disciples of Lucian. It is probable that Lucian's opinions were not quite orthodox, since he is said by Alexander (in Theodoret, *Hist. Eccl.* i., c. 4, p. 15, B) to have been excluded from the Catholic Church by three bishops in succession, for advocating the doctrines of Paul of Samosata. It is however usually supposed that he returned to the Catholic communion before his death.

LU'CIDA, a name formerly given to the brightest star in any constellation: thus we have Lucida Hydræ, Lucida Lyræ, &c.

LU'CIFER, bishop of Cagliari in Sardinia, is principally known in ecclesiastical history for refusing to hold any communion with the clergy who had, during the reign of Constantius, conformed to the Arian doctrines, although it had been determined in a synod at Alexandria, A.D. 352, to receive again into the church all the Arian clergy who openly acknowledged their errors. In consequence of the decision of the synod at Alexandria, Lucifer eventually left the Catholic church, and his followers are spoken of by ecclesiastical writers as a distinct sect under the name of Luciferians. The number of this sect was always inconsiderable; Theodoret says that it was extinct in his time (*Hist. Eccl.*, iii., c. 5, p. 128, D.) Their opinions however excited considerable attention at the time when they were first promulgated, and were advocated by several eminent men; among others by Faustinus, Marcellinus, and Hilarius. Jerome wrote a work in refutation of their doctrines, which is still extant.,

Augustine remarks, in his work on Heresies (c. lxxxi.), that the Luciferians held erroneous opinions concerning the human soul, which they considered to be of a carnal nature, and to be transfused from parents to children.

Lucifer is acknowledged by Jerome and Athanasius to have been well acquainted with the Scriptures, and to have been exemplary in private life; but he appears to have been a man of violent temper and great bigotry. Being banished from Sardinia by Constantius, in consequence of his opposition to the Arian doctrines, he resided for many years in Syria; but after the death of this emperor he returned to his diocese, where he died about A.D. 370.

The writings of Lucifer were published by Tillet, Paris, 1568; they consist of—'Two books addressed to the Emperor Constantius in defence of Athanasius;' 'On Apostate Kings;' 'On the Duty of having no communion with Heretics;' 'On the Duty of dying for the Son of God;' 'On the Duty of showing no mercy to those who sin against God;' and a short Epistle to Florentius.

LUCI'LIUS, CAIUS, was born at Suessa Aurunca (*Sessa*), a town in the north-western part of Campania, B.C. 148. He belonged to the equestrian order, and, by the female side, was grand-uncle to Pompey the Great. In his sixteenth year Lucilius served, together with Marius and Jugurtha, under Scipio Africanus at the siege of Numantia. (Velleius, ii., 9, 4.) He is said to have died B.C. 103, in his forty-sixth year; but the expression of

Horace (*Sat.* ii., 1, 34), in which Lucilius is called *old* (*senex*), seems to imply, as Mr. Clinton has remarked (*Fast. Hell.*, vol. iii., p. 135), that he lived to a later date.

Lucilius is expressly said by Horace (*Sat.* i., 1, 61) to have been the first writer of Roman satire; by which we must not understand that no Roman writer had composed any satirical compositions before him, since the satires of Ennius and others are frequently mentioned by antient authors; but that Lucilius was the first who constructed it on those principles of art which were considered in the time of Horace as essential requisites in a satiric poem. The satires of Lucilius were very popular even in the Augustan age; and to his writings some of the most eminent satirists of antiquity, Horace, Juvernal, and Persius, appear to have been indebted in no small degree for many of their most striking thoughts and expressions.

In addition to his satires, which were divided into thirty books, Lucilius also wrote a comedy entitled 'Numularius,' epodes, and hymns, none of which are extant, with the exception of a few fragments from his satires, which were collected and published by Douza, Leyden, 1597. Scanty as these fragments are, they enable us to form some idea of the style of Lucilius, which appears to have been distinguished by great energy and power of expression, but to have been deficient in elegance and clearness. Horace compares his poetry to a muddy stream, and complains that his versification was rugged and uncouth (*Sat.* i., 4, 8-11); but Quintilian (*Inst. Or.*, x. 1), on the other hand maintains that Horace has not given a fair estimate of the poetry of Lucilius, and that his satires were distinguished by great learning and abundance of wit. Pliny (*Præf. Hist. Nat.*), Cicero (*De Orat.*, i. 16; ii. 6), and Gellius (*N. A.*, xviii. 5), also speak in high terms of the style of Lucilius. Juvenal (i. 20) calls him *magnus Auruncæ alumnus*.

Lucilius attacked vice with such severity, that Juvenal (i. 165) speaks of the guilty as trembling at the vehemence of his rebukes. He did not however confine his satires to the vices of mankind in general, but also attacked private individuals, like the writers of the old comedy among the Greeks, and among other persons, contemporary and preceding poets, as Ennius, Cæcilius, Pacuvius, Accius, &c. (Gell., *N. A.*, xvii. 21.) The powerful protection of Scipio and Lælius, with whom he was on the most intimate terms of friendship (Hor., *Sat.* ii. 1, 70-75), enabled him also to attack with impunity some of the most eminent political characters in Rome; among whom we find the names of Quintus Opimius, conqueror of Liguria, Cæcilius Metellus, and Cornelius Rufus, who was at that time Princeps Senatus.

LUCI'NA (Conchology). [Veneridæ.]

LU'CIUS I. succeeded Cornelius in 252 as bishop of Rome. Little is known of him; he survived his election only a few months; some say he was banished, others that he died a martyr. He was succeeded by Stephen I.

LUCIUS II. succeeded Celestinus II. in 1144, and being wounded by a stone thrown at him in an affray of the people of Rome, died shortly after, and was succeeded by Eugenius III.

LUCIUS III., Cardinal Ubaldo, a native of Lucca, was elected by the cardinals after the death of Alexander III. in 1181, and was consecrated at Velletri, the people of Rome being opposed to him. He died in 1185, shortly after having an interview with the emperor Frederic Barbarossa at Verona. He was succeeded by Urban III.

LUCKNOW, the capital of the kingdom of Oude, stands on the south bank of the Goomty river, in 26° 51′ N. lat. and 80° 50′ E. long. It was a large and populous place in the time of Abul Fazl, but was not made the residence of the court until the accession of Asoph ud Dowlah in 1775, upon which event it was considerably enlarged, and after a few years became one of the wealthiest cities of Hindustan.

Lucknow consists of three distinct quarters: the first, or oldest part, is made up of narrow and dirty streets, and is said to contain at least 300,000 inhabitants; the second quarter consists of one handsome street, with a well-built market-place in the centre, and with smaller streets branching from it at right angles. The greater part of the houses in this quarter are the property of the king, and are occupied by branches of his family or persons attached to the court. A space between this street and the river contains the royal palace and gardens, furnished and laid out in imitation of European fashions. The dwelling of the British resident adjoins the palace. The remaining quarter of the city is built in a purely Oriental style, for which reason it has the most interest for European visitors; it contains many splendid houses and religious edifices, erected by Asoph ud Dowlah, and an unfinished palace begun by Saadet Ali. This is not the only structure in the city which has been left in an unfinished state through a prejudice universally felt by the Mohammedans in India against completing any unfinished undertaking of a deceased person. The English have cantonments to the east of the Goomty, and a few miles distant from Lucknow. Besides the persons connected with the British residency there are many English and other Europeans and their descendants living in the city, who are in the pay of the king of Oude. Lucknow is distant from Benares 189 miles, from Agra 202 miles, from Delhi 280 miles, and from Calcutta 650 miles, all travelling distances.

LUCON. [Vendée.]

LUÇON. [Philippine Islands.]

LUCRETIA. [Brutus, M. J.]

LUCRE'TIUS, with his full name TITUS LUCRETIUS CARUS, was born B.C. 95, and died B.C. 52, in the forty-fourth year of his age. We possess no particulars respecting his life, but he appears to have been born at Rome, was probably of equestrian rank, and is said to have put an end to his own life.

The poem of Lucretius, entitled 'De Rerum Natura' (*On the Nature of Things*), contains a development of the physical and ethical doctrines of Epicurus. Notwithstanding the nature of the subject, which gave the poet little opportunity for those descriptions of the passions and the feelings which generally form the chief charm in poetry, Lucretius has succeeded in imparting to his didactic and philosophical work much of the real spirit of poetry; and if he had chosen a subject which would have afforded him greater scope for the exercise of his powers, he might have been ranked among the first of poets. Even in the work which has come down to us we find many passages which are not equalled by the best lines of any Latin poet, and which, for vigour of conception and splendor of diction, will bear a comparison with the best efforts of the poets of any age and country. In no writer does the Latin language display its majesty and stately grandeur so effectively as in Lucretius. There is a power and an energy in his descriptions which we rarely meet with in the Latin poets; and no one who has read his invocation to Venus, at the beginning of the poem, or his beautiful picture of the busy pursuits of men, at the commencement of the second book, or the progress of the arts and sciences in the fifth, or his description of the plague which devastated Athens during the Peloponnesian war, at the close of the sixth, can refuse to allow Lucretius a high rank among the poets of antiquity.

The object of Lucretius was to inculcate the great doctrine of Epicurus, so frequently misunderstood and misrepresented, that it is the great object of man's life to increase to the utmost his pleasures, and to diminish to the utmost his pains; and since the happiness of mankind was chiefly prevented, in his opinion, by two things, superstition, or a slavish fear of the gods, and a dread of death, he endeavours to show that the gods take no interest in and exercise no control over the affairs of mankind, and that the soul is material and perishes with the body. In the first three books he develops the Epicurean tenets respecting the formation of all things from atoms which existed from all eternity; and also maintains the materiality of the soul, which he supposes to be compounded of different kinds of air inhaled from the atmosphere; in the fourth book he inquires into the origin of sense and perception, and the nature and origin of dreams, which leads to a long digression on the folly and miseries of unlawful love; in the fifth he gives an account of the origin and laws of the world, and describes the gradual progress of mankind from a state of nature to civilization, as well as the origin and progress of the arts and sciences; and in the sixth he attempts to account for a number of extraordinary phenomena, such as waterspouts, hurricanes, earthquakes, volcanoes, and pestilential diseases.

The poetry of Lucretius does not appear to have been highly estimated by the majority of his countrymen. Ovid certainly speaks of it in the highest terms (*Amor.*, xv. 23); but Quintilian mentions him rather slightingly (*Inst. Orat.* x. 1); and Cicero does not praise him without considerable reservation (*Epist. ad Quint.*, ii. 11). The nature of his subject and the little taste which the Romans in general manifested for speculations like those of Lucretius, may perhaps account for his poetry being estimated below its real merits.

In modern times the 'De Rerum Natura' has been frequently attacked on account of its philosophical doctrines; and among the works that have been written against it is a long Latin poem, not without considerable merit, by the Cardinal Polignac, entitled 'Anti-Lucretius, sive de Deo et Natura,' in nine books, addressed to Quintius, an atheist.

The best editions of Lucretius are, by Lambinus, whose commentary is very useful, 1563, 1570; Havercamp, 1725; Wakefield, 1796-97; Eichstädt, 1801; and Forbiger, 1828. The 'De Rerum Natura' has been translated into most European languages; the translations most worthy of notice are, the English by Creech (frequently printed), and by Mason Good, with the Latin text, and numerous notes of little value, in 2 vols. 4to., 1805; the French by Lagrange, with the Latin text, 1799; the German by Meinecke, 1795, and by Knebel, 1821; and the Italian by Marchetti, 1717, frequently reprinted.

LUCRINE LAKE. [Averno.]

LUCU'LIA, a genus of the natural family of Rubiaceæ, suborder Cinchonaceæ, tribe Cinchoneæ, and subtribe Eucinchoneæ, thus indicating the close affinity of this genus to that of the trees yielding Peruvian bark, or true Cinchonas, in which indeed the only known species, *L. gratissima*, was placed by Dr. Wallich and figured in his 'Tent. Fl. Nepal,' t. 21. It is found in great abundance on Nag-Urjoon and some of the other smaller hills in the Valley of Nepal; also at Bechiaco and Koolakan. It delights in exposed, rather naked situations, blossoming, according to the situations where it is found, nearly the whole year round. It is also found on the Pandooa Hills in Silhet, flowering in the month of September. As seen by Dr. Wallich it attains a height of sixteen feet, but he was informed of its growing to a larger size. It has been introduced into and has flowered in this country; but from the nature of the climate where it is indigenous, it is only suited to the greenhouses of England. Its locality and affinity are interesting, particularly when coupled with the prevalence in the same mountains of two other genera, Hymenodictyon and Hymenopogen, belonging to the same subtribe Eucinchoneæ, and therefore equally allied to the true Cinchonas; all indicating the part of the Indian territory where these valuable plants might most certainly be grown, and yield a profitable article of commerce. 'It is impossible to conceive anything more beautiful than this tree, when covered with its numerous rounded panicles of pink-coloured, very fragrant, large blossoms.' (Wallich, l. c., p. 30.)

LUCULLUS, LU'CIUS LICI'NIUS, descended from a distinguished Roman family, was born about B.C. 115, and served under Sulla in the Marsian war. Sulla had a very high opinion of the talents and integrity of Lucullus, and employed him, though he was very young, in many important enterprises. Whilst Sulla was besieging Athens (B.C. 87), Lucullus was sent into Egypt and Africa to collect a fleet; and after the conclusion of the war with Mithridates, he was left in Asia to collect the money which Sulla had imposed upon the conquered states. So great was the regard that Sulla had for Lucullus, that he dedicated his Commentaries to him, and in his last will made him guardian to his son.

In B.C. 74, Lucullus was elected consul, and was appointed to the command in the war against Mithridates. During the following eight years he was entirely engaged in conducting this war; and in a series of brilliant campaigns completely defeated Mithridates and his powerful son-in-law Tigranes. In B.C. 73 he defeated Mithridates at Cyzicus on the Propontis, and in the following year again conquered him at Cabiri, on the borders of Pontus and Armenia. In B.C. 69 he marched into Armenia against Tigranes, who had espoused the cause of his father-in-law; and completely defeated his forces near Tigranocerta in Armenia. He followed up his victory by the capture of Tigranocerta, and in the following year also took Nisibis in the north part of Mesopotamia; but was not able to derive all the advantages he might have done from his victories, in consequence of the mutinous disposition of his soldiers. Lucullus never appears to have been a favourite with his troops; and their disaffection was increased by the acts of Clodius, whose sister Lucullus had married. The popular party at home were not slow in attacking a general who had been the personal friend of Sulla, and who was known to be a powerful supporter of the patrician party. They accused him of protracting the war on account of the facilities it afforded him of acquiring wealth; and eventually carried a measure by which he was removed from the command, and succeeded by Pompey, B.C. 66.

The senate, says Plutarch, had looked forward to Lucullus as likely to prove a most powerful supporter of the patrician order; but in this they were disappointed: for Lucullus on his return to Rome took no part in public affairs, and passed the remainder of his life in retirement. The immense fortune which he had amassed during his command in Asia he employed in the erection of most magnificent villas near Naples and Tusculum; and he lived in a style of magnificence and luxury which appears to have astonished even the most wealthy of his contemporaries. Lucullus was a man of refined taste and liberal education: he wrote in his youth the history of the Marsian war in Greek (Plutarch, *Luc.*, c. i.; compare Cic. *Ad Att.*, i. 12), and was a warm supporter of learning and the arts. His houses were decorated with the most costly paintings and statues, and his library, which he had collected at an immense expense, was open to all learned men. He lived on intimate terms with Cicero, who has highly praised his learning, and inscribed one of his books with the name of his friend, namely, the fourth book of his 'Academical Questions,' in which he makes Lucullus defend the philosophical opinions of the Old Academy.

It is said that during the latter years of his life Lucullus lost his senses, and that his brother had the care of his estate.

(Plutarch's *Life of Lucullus*; Livy's *Epitomes*; Appian's *Mithridatic War*; Cicero's *Acad. Quæs.*, iv.; Clinton's *Fasti Hellenici*.)

LUDLOW, a corporate town and parliamentary borough of Shropshire, 138 miles north-west by west from London. It is locally within the hundred of Munslow, and is agreeably situated on the eastern bank of the Teme, a branch of the Severn, over which river there is a handsome stone bridge of three arches. The charters date from the first year of the reign of Edward IV. to the first of James II. The property of the corporation consists chiefly of houses and lands in Ludlow and its immediate vicinity. The income derived from this source amounted, in the year ending September 29, 1833, to 3010*l.*; the expenditure during the same period was 2476*l.* The town council is composed of four aldermen and twelve councillors.

The streets of Ludlow are broad, well paved, and lighted with gas, and the houses are in general well built. The inhabitants are amply supplied with water, which is partly drawn from three springs situated about a mile and a half from the town, and thence conveyed in leaden-pipes, and partly raised by machinery from the river Corve. The ordinary police, consisting merely of the chief constable and eight others appointed by the leet, is said to be effective. The borough gaol, erected in 1764 at the expense of the corporation, is commodious, and contains separate wards for the classification of the prisoners. The manufacture of gloves was formerly on a large scale, but of late years it has much declined, in consequence, it is said, of the competition of the manufacturing towns of Liecestershire and Nottinghamshire. The parish church, dedicated to St. Lawrence, is in the diocese of Hereford, and the living, a rectory in the patronage of the crown, is valued at 160*l.* per annum.

The free grammar-school, founded by Edward VI., is conducted by a master and usher, whose salaries are respectively 100*l.* and 60*l.* All boys duly qualified by residence within the borough, and able to read tolerably, are admitted upon application. The number of free scholars in 1835 was under thirty. Besides the grammar-school, there is the national school, connected with the church, which is liberally supported by voluntary donations, and affords instruction to 100 girls and 150 boys. There are also two schools established by the Independents and Wesleyan Methodists, which are numerously attended. In 1831 the population of the borough was 5253. Ludlow has returned two members to parliament continuously from the reign of Edward IV. (*Boundary Reports; Municipal Corporation Reports*, &c.)

LUDLOW ROCKS. The upper part of the 'Silurian system' of Mr. Murchison is thus designated. They include the following three terms:—

Upper Ludlow Rock.—A thick mass of laminated argillaceous deposits, seldom acquiring considerable hardness, and suggesting the notion of having been deposited as a nodular structure, from which circumstance it has also been called 'mudstone' by Mr. Murchison. Very rich in fossils.

Aymestry Limestone.—A concretionary and polypiferous limestone, of local occurrence and small thickness, merely separating the other terms. Many fossils.

Lower Ludlow Rock.—Chiefly an argillaceous, shaly, and flaggy deposit, with a few calcareous nodules, yielding shells.

The limestone of Wenlock and Dudley lies below.

LUDLOW, EDMUND, was born at Maiden-Bradley in Wiltshire, about the year 1620. His father, Sir Henry Ludlow, a considerable landed proprietor in that county, and its representative in the Long Parliament, was an advocate of the democratic cause, which was likewise eagerly espoused by his son. Edmund Ludlow volunteered in Essex's army, and first engaged the king's forces at the battle of Edge-hill (1642); from this time, with only occasional interruptions, he filled such stations, military or civil, as rendered him an important partisan. He denounced the imprisonment of the king, and sought the destruction of the monarchy and the establishment of a commonwealth. He was one of the most active assistants in Col. Pride's purge, one of the foremost of the king's judges, and one of the most eager voters for the annihilation of the House of Peers. His independence rendered him obnoxious to Cromwell, who, to impair his influence, sent him to Ireland with a military command (1650), an expedient which must be acknowledged to have been most politic; for when Cromwell assumed the authority of Protector, Ludlow loudly protested against his elevation, and if he had been in England might possibly have impeded it. Constant in his advocacy of an equal commonwealth, he refused, when he left Ireland, to yield Cromwell an unqualified submission. He was regarded with great jealousy on account of this refusal, and security was required that he should not act in hostility to the government. His brother, Thomas Ludlow, privately furnished the security, and Ludlow retired into Essex, where he resided until Oliver Cromwell's death. He then resumed his public course; was active in parliament in the Committee of Safety, in the council of state, and again received a command of troops in Ireland. Accusations were afterwards brought against him by the council of officers; he was called an opponent of the interests of the army, and charged with high treason. In consequence of these charges he travelled to London, resumed his seat in parliament, and there offered to enter on his defence; but such was the state of confusion at this time, Monk and his forces being daily expected in London, that he was neither heard nor were the proceedings against him advanced any further. When the king was restored, Ludlow, justly estimating his insecurity, fled the country; and after narrowly escaping capture, landed at Dieppe, in September, 1660. From Dieppe he went to Switzerland, and having visited Geneva and Berne, resided principally at Vevay. In 1689, wearied with exile, he returned to England, hoping that his offences as a regicide were either forgotten or forgiven; but he was disappointed; an arrest was threatened, and he was compelled again to fly to Vevay, where he died in 1693, aged seventy-three years. His memoirs were written in Switzerland, and first printed at Vevay, two volumes in 1698, and a third in the following year. (Ludlow's *Memoirs*.)

LUDOLPHUS, JOB (the Latinized form of his real name Leutholf), was born at Erfurt, the 15th June, 1624, and was educated at the university of Leyden, where he principally studied jurisprudence and the Oriental languages. After leaving Leyden, he remained for some time in Paris as tutor to the sons of the Swedish ambassador. In 1652 he removed to the court of the duke of Saxe-Gotha, in order to superintend the education of the duke's children. During the latter part of his life he resided at Frankfort-on-the-Main, where he died on the 8th April, 1704.

Ludolph was one of the most eminent Oriental scholars of his age, and appears to have been the first European who acquired a knowledge of the Ethiopic language, which he learnt with the assistance of a native of Abyssinia. He published at London, in 1661, a dictionary and grammar of this language; but a much improved edition of the dictionary appeared at Frankfort in 1699, and of the grammar in 1702. Ludolph also paid great attention to the Amharic language, of which he published a dictionary and grammar in 1698.

The most important of Ludolph's other works are: 'Historia Æthiopica, sive Descriptio Regni Habessinorum, quod vulgo male Presbyteri Johannis vocatur,' Frankfort, 1681; 'Ad Historiam Æthiopicam Commentarius,' Frankfort, 1691 (there is an English edition of the 'History of Ethiopia'); 'Relatio Nova de hodierno Habessiniæ statu ex India nuper allata,' Frankfort, 1693; 'Appendix Secunda ad Historiam Æthiopicam, continens Dissertationem de Locustis,' Frankfort, 1694; 'Epistola Æthiopica ad universam Habessinorum gentem scripta,' Frankfort, 1683; 'Epistolæ Samaritanæ Sichemitarum ad Ludolphum,' with a Latin translation and notes, 1688; and a translation of the Psalms into Ethiopic, Frankfort, 1701.

LUGANO. [Ticino.]

LUGO. [Galicia.]

LUKE, ST., the Evangelist. Respecting the birth and early life of this evangelist we have no certain information; of his later history we learn something from his own work, the *Acts of the Apostles*. [Apostles, Acts of.] A considerable knowledge of the Greek language is displayed in his writings, especially in the introduction to his Gospel, which is written in elegant Greek. On the other hand, his language contains many Hebraisms, and he was evidently well acquainted with the religious rites of the Jews, whose mode of computing time he follows. (*Luke*, xxii. 1; *Acts*, ii. 1; xii. 3, 4; xx. 6, 16, &c.) Hence it has been much disputed whether he was a *Jew* or a Gentile before he embraced Christianity. The difficulty is best explained by the opinion of Bolten, confirmed by a tradition current in Jerome's time, that Luke was a Greek by birth, but became a proselyte to Judaism early in life. This opinion is supported by *Acts*, xxi. 28-31, and *Colos.*, iv. 11, 14. From the former passage we learn that the Jews accused Paul of defiling the temple by bringing into it a Greek, Trophimus of Ephesus. Luke was then with Paul (*Acts*, xxi. 17, 18), and the accusation would have regarded him also, if he had not been looked upon as a *Jew by religion*. In the latter passage Paul distinguishes Luke from other individuals 'who are of the circumcision,' which seems to shew that Luke was not a Jew *by birth*; unless indeed the Luke here mentioned be another individual, which we have no reason to suppose. Of the period of his conversion to Christianity we know nothing. Cave and Mill have supposed that he was converted by Paul at Antioch; but they are not supported by any antient writer: nor is it likely that Luke would have passed over such an event in writing the *Acts*.

From the passage quoted above (*Col.*, iv. 14), and from the testimony of Eusebius, Jerome, and other early writers, it appears that Luke was a physician. Another tradition makes him a painter, but this statement is generally allowed to deserve no credit; and the opinion of Grotius and Wetstein, that he was a slave during part of his life, seems equally unfounded.

Luke's native country is unknown. Eusebius and Jerome say that he was a native of Antioch; but this statement is not found in Irenæus, Clement, Tertullian, or Origen, nor in any writer before the time of Eusebius. Eichhorn has conjectured that this tradition arose from confounding the Evangelist with Lucius of Cyrene, who is mentioned as living at Antioch, in *Acts*, xiii. 1. Many writers however entertain the opinion, which is as old as the time of Origen, that this Lucius and the evangelist Luke were the same person. This conjecture is ably maintained by Mr. Charles Taylor, the editor of Calmet.

Some early writers, but of no very high authority, affirm that Luke was one of the seventy disciples sent forth by Christ, whose mission he alone of the Evangelists records. (*Luke*, x.) Others mention him as the companion of Cleopas in the journey to Emmaus, recorded in *Luke*, xxiv. 13. It is alleged that the mention of Cleopas, while his companion's name is withheld, the fullness and general character of the narrative, and especially the notice of minute circumstances which none but an eye-witness could record, prove that the traveller was the Evangelist himself. Other reasons are adduced for believing him to have been in Jerusalem at this time; namely, that the latter part of his Gospel and the earlier chapters of the *Acts* have every mark of being written by an eye-witness of the facts he narrates, and that all the appearances of Christ after his resurrection mentioned by him took place in the neighbourhood of Jerusalem. To this it is objected that we can only understand the preface to his Gospel (i. 1-4) as a distinct assertion that St. Luke was not an eye-witness himself, but that he derived his information from others who were eye-witnesses.

In *Acts*, xi. 28, the Cambridge MS. has a various reading, 'and when we were gathered together, there stood up,' &c., which, if admitted, would prove that Luke was connected with the Church at Antioch about A.D. 42: but this reading is not usually accounted of any great authority.

The first distinct mention of Luke in the New Testament is in *Acts*, xvi. 10, 11, where, in relating the vision which Paul saw at Troas, the writer suddenly begins to use the first person plural, whence it is inferred that Luke here joined the Apostle (about A.D. 53), whom he accompanied to Philippi (ver. 12). He seems to have remained at Philippi during Paul's journey to Athens and Corinth; for he drops the first person at ver. 17, and does not resume it till he relates Paul's return to Philippi (xx. 5, 6). From this time it appears from the *Acts* that Luke was Paul's constant companion till his arrival at Rome (about A.D. 61 or 63), where he remained with the Apostle for some time, probably during Paul's first imprisonment. He is mentioned more than once in Paul's Epistles written during this period. (*Col.*, iv. 14; 2 *Tim.*, iv. 2; *Philem.*, v 24.) Some suppose him to be 'the brother whose praise is in all the churches,' mentioned in the Epistle to the Corinthians (viii. 18; xii. 18). Besides his intimacy with Paul, he is said by Irenæus, Eusebius, Jerome, and other early writers, to have had a considerable acquaintance with the rest of the Apostles: indeed, they often speak of Luke and Mark as disciples of the Apostles, as distinguished from John and Matthew, who were disciples of Christ.

Respecting the end of Luke's life, the tradition is, that after Paul's liberation from his first imprisonment, he retired to Achaia, where he resided some few years, wrote his Gospel and the Acts of the Apostles, and died at an advanced age (some say 80, others 84 years), probably by a natural death, as we have no mention of his martyrdom.

LUKE, ST., THE GOSPEL OF, is a narrative of the life of Jesus Christ, written by the evangelist Luke, and one of the canonical books of the New Testament.

The genuineness and authenticity of this Gospel are attested by the unanimous voice of the early Christian writers, and confirmed by internal evidence, and by the passage in *Acts*, i. 1, compared with this Gospel, i. 4. Michaelis has indeed objected to its canonical authority, and to that of St. Mark's Gospel also, chiefly on the ground that these books are not the production of Apostles. But such an argument cannot be admitted in opposition to the universal opinion of the primitive Christians, nor have we any proof that inspiration was confined to the Apostles. The genuineness of parts of the Gospel has been called in question, especially of the 1st and 2nd chapters. But these chapters, being in all existing MSS., are supported by a weight of external evidence which no internal difficulties can overthrow.

Many of the early writers state that St. Luke composed his Gospel under the superintendence of St. Paul. Irenæus says that 'Luke put down in a book the gospel preached by Paul;' Tertullian, that 'Luke's digest is often ascribed to Paul.' In all probability St. Luke would not neglect St. Paul's assistance in so important a work, but the idea that the Gospel is really St. Paul's, and that St. Luke was little more than his amanuensis, is not sustained by any striking agreement in the style of the two writers.

The most probable date of St. Luke's Gospel is about A.D. 63 or 64. It is closely connected with the Acts of the Apostles, and was probably written not long before that book. (*Acts*, i. 1.) Some writers place it in A.D. 53. Theophylact asserts that it was written fifteen years after Christ's ascension.

With respect to the place of its composition the common tradition is that it was written in Greece; Jerome says in Achaia and Bœotia.

Like the Acts of the Apostles, this Gospel is dedicated to Theophilus. The conjectures of critics respecting this personage are as numerous as is usual on such points; the conclusion at which Kuinoel arrives is that he was a converted Gentile, living without the bounds of Palestine. This dedication, the testimony of early writers, and some marks in the work itself, such as the explanations given of matters exclusively Jewish, prove that the Gospel was designed for the benefit of Gentile converts.

The contents of this Gospel are not arranged, like those of St. Matthew and St. Mark, in chronological order, but rather according to the subjects. Schleiermacher has proposed the following classification:—

1. The interval preceding the public life of Jesus, chaps. i. and ii.
2. Narratives of actions and discourses of Jesus chiefly at Capernaum and its neighbourhood. Chaps. iii. to ix. 39.
3. Similar narratives, relating mostly to a journey of Christ to Jerusalem. The exact end of this division is doubtful.
4. The last days of Christ, his sufferings and death, and his resurrection and ascension.

The qualifications of St. Luke for the task he undertook were very high. He was evidently a well-educated man; perhaps he was an eye-witness of many of the events he relates: and assuredly he had excellent opportunities of gaining information from eye-witnesses. He assures us that he had 'accurately examined all matters from the very first' (παρηκολουθηκότι ἄνωθεν πᾶσιν ἀκριβῶς, i. 3): and his assertion is borne out by many marks of care and accuracy which appear in his narrative. In both his works he is scrupulously minute with respect to dates and numbers (see for example *Luke*, iii. 1): and he has taken the trouble to insert copies of important documents and accurate reports of speeches. The examples of the latter are very numerous; of the former we have a striking instance in the letter of Lysias to Felix. (*Acts*, xxiii. 26.) It will not indeed appear improbable to an attentive reader of this evangelist, especially in the account of Paul's voyage from Cæsarea to Rome, that he was in the habit of keeping a journal of events, which he used in composing his histories.

The controversy concerning the sources of this Gospel and those of St. Matthew and St. Mark has been alluded to under GOSPEL. A full account of the theories framed on this subject will be found in the Appendix to the fourth volume of Horne's 'Introduction.'

(Lardner's *Credibility*, and *Lives of the Apostles and Evangelists*; Cave's *Lives of the Apostles and Evangelists*; Kuinoel, *Comment. in Lib. Hist. N. T. Proleg. in Luc.*; Calmet's *Dictionary to the Bible*, by Charles Taylor; the *Introductions* of Michaelis (by Bishop Marsh), Hug, Horne, and Eichhorn; and Schleiermacher's *Critical Essay on the Gospel of Luke*, with Introduction by the Translator.)

LULEA-ELF. [BOTHNIA.]

LULLY, RAYMUND, surnamed the Enlightened Doctor, an enthusiastic and remarkable character of the thirteenth century, was born at Palma, in the island of Majorca, in 1234. In early life he followed his paternal profession of arms in the service of the king of Aragon, and abandoned himself to all the licence of a soldier's life. Passing from extreme to extreme, Lully subsequently retired to a desert, where he pursued a life of solitude and rigorous asceticism. Here he pretended to have had visions, and, among others, a manifestation of Christ on the cross, who called him to his service and the conversion of the Mohammedans. Hereupon he divided all his property among the poor; and in his thirtieth year he began to prepare himself, by diligent study, for the labours and duties of a missionary. Learning Arabic from a slave, he read in that language several philosophical works, the perusal of which, in all probability, suggested those new views of grammar and dialectic by means of which he hoped to reform science, and thereby the world itself. Full of this idea he had a second vision of the Saviour in the semblance of a fiery seraph, by whom he was expressly enjoined to commit to writing and to publish the treatise, to which he himself gave the name of 'Ars Lulliana,' but which his followers and admirers dignified by the title of the 'Great Art' (Ars Magna). Having besought James of Aragon to establish a monastery in Majorca for the education of thirteen monks in the Arabic language and the duties of missionaries, he went to Rome to seek the countenance of Pope Honorius IV. for similar institutions and his own mission. Receiving however little encouragement, he visited Paris and Genoa with the same design, and with similar success. From Genoa he crossed to Africa, where he was in danger of losing his life in consequence of his dispute with a Mohammedan whom he sought to convert, but was saved by the intercession of an Arabian mufti, on the condition of quitting Africa for ever. This promise however he subsequently considered not to be binding upon him; for after revisiting Italy, and in vain seeking to excite sympathy and co-operation in his designs, he reasssumed, unassisted, his enthusiastic enterprise. Proceeding first to Cyprus and thence to Africa, he was nearly stoned to death; and being cast into prison, owed his liberty to the generosity of some Genoese merchants. Upon his return to Europe Lully visited its principal cities, preaching the necessity of a crusade for the recovery of the Holy Land, a plan of which he laid before Pope Clement V., by whom it was received with little or no favour. Unchecked however by so many disappointments, and with the ardour of his enthusiasm still unabated, Lully returned a third time to Africa, where his zeal for conversion entailed upon him dreadful torments, from which he was a second time rescued by the generosity of the Genoese. The sufferings however to which he had been exposed were so great, that Lully died on his passage home when he was just within sight of his native country, in the year 1315.

The 'Ars Magna Lulli, or the Lullian Art,' which found a few admirers, who styled themselves Lullists, after its inventor, and was subsequently revived and improved by the celebrated Giordano Bruno, is an attempt to give a formal arrangement of all ideas, with a view as well to facilitate instruction as to systematise knowledge. The means which this logical machine employs are:—1, letters (alphabetum artes), which stand for certain general terms common to all sciences, but especially to logic, metaphysics, ethics, and theology; 2, figures, viz.—triangles, squares, and circles, which indicate the relations of those general terms; and 3, sections (cameræ), in which the combinations of these ideas or terms are formed by the adjustment of the figures. In the angular spaces of the triangles and squares certain predicates are inscribed, and certain subjects on the circles. On the circle of subjects, the triangles of the predicates being so fixed as to move freely, every possible combination of ideas is supposed to be produced by their revolution, according as the angular points successively pass before the letter inscribed on the margin of the circle. Hence arise definitions, axioms, and propositions, which vary infinitely according to the different application of general or particular predicates to particular or general subjects. As however the ideas which are selected for the fundamental notions of this mechanical logic are purely arbitrary, the knowledge to which it professes to lead must be narrow and limited, and at best it does but furnish a few laws of universal notions for analysis and combination. Nevertheless as the invention, weak as it is, was founded on a feeling of the inadequacy of the dialectic of the schools, and as it furnished a weapon for its opponents, the name of Raymund Lully has been gratefully placed on the list of the reformers of philosophy. In his personal character he seems to claim more justly our admiration for the iron resolution with which, late in life, and for the most part unassisted, he applied himself to the study of science and philosophy, and for the steady resolution with which he persevered in his scheme of converting the heathen in despite of all discouragements and disappointment.

The works of Lully have been edited by Salzinger, 'Raymondi Lullii opera omnia,' in 10 vols. fol., Mayence, 1721-42.

LULLY (or LULLI), JEAN-BAPTISTE, the father of French dramatic music, was the son of a miller, and born at Florence in 1633. Showing in his infant years a strong propensity for music, a kind-hearted monk taught him the use of the guitar, an instrument then as common in Italy as it is now in Spain. Having attracted the notice of the Chevalier Guise, he was by that nobleman recommended to Mademoiselle de Montpensier, niece of Louis XIV., as a page, and sent to Paris in his fourteenth year. But his ready wit and talent found no favour in the eyes of the princess, for they were not set off by either a good figure or a pleasing countenance. Instead therefore of becoming the bearer of the lady's fan, or perhaps of her confidential communications, he was placed in the kitchen, and commenced his life of activity in the humble capacity of *marmiton*, or scullion. This degradation however did not much discourage him. He had previously acquired some knowledge of the violin, and now dedicated every spare moment to it. His devotion and industry were crowned with success. The report of his skill quickly ascended to the apartments of the princess, who placed him under an able master, and he soon was numbered among the king's twenty-four violins. He now aspired to the rank of composer, and having produced some airs which 'with ravished ears the monarch heard,' he was individually summoned into the royal presence, commanded to perform himself the compositions which had excited so much pleasure, and from that moment the road to promotion and honour was opened to him. He was immediately placed at the head of a new band, denominated *Les Petits Violons*, which soon eclipsed the famous *bande des vingt-quatre*.

Lully now was engaged to write music for the *Ballets*, entertainments of a mixed kind much admired at court. But Louis, ambitious of rivalling the grand opera not long before established at Venice, and encouraged in his design by the Cardinal Mazarin, founded, in 1669, the *Académie Royale de Musique*, an institution which has ever since continued to flourish. At the head of this, Lully, who had been appointed *Surintendant de la Musique de la Chambre du Roi*, was soon placed, and being associated with Quinault, the admirable lyric poet, carried into effect the king's wishes to their utmost extent. His abilities and exertions were not, as is too usual, suffered to remain unrewarded: besides the glory of complete success, he acquired a handsome fortune, and was raised to the honourable rank of *Secrétaire du Roi*. The proud *Secrétaires* hesitated at admitting a *marmiton* into their number. Lully complained to the king. 'I have honoured them, not you,' said the monarch, 'by putting a man of genius among them.'

On the recovery of Louis from a severe operation, Lully composed a *Te Deum*, and during a rehearsal of it, while beating the time to the band with his cane, he struck his foot a violent blow, which was followed by serious consequences, and having put himself into the hands of a quack, his life paid the forfeit of his credulity. He died in Paris, in 1687, where, in the church *des Petits Pères*, his family erected a splendid monument to his memory. In his last illness he was attended by a priest, who refused him the consolations of the church, unless he consented to destroy the opera on which he was engaged. He complied: the manuscript was committed to the flames. A friend, entering shortly after, reproached him for having listened to a dreaming Jansenist. 'Hush! hush!' whispered the composer, 'I have another fair copy of the work in my drawer.'

Lully was a shrewd man, possessing a considerable fund of humour, and many pleasant anecdotes are related of him. His companionable qualities led him too much into company, which he did not enjoy in a temperate manner, and the serious turn which the accident just mentioned took was imputed to the bad state of body produced by his habitual indulgences. As a composer, he is to be ranked among the first in his art. To him music is indebted for some of its greatest improvements, and his works display genius of a high order tempered by the soundest judgment. Even Handel acknowledged that he modelled his overtures after those of Lully; and our illustrious Purcell did not hesitate to profit by many hints afforded by the nineteen operas composed by the favourite of *Louis le Grand*.

LUMBA'GO. [RHEUMATISM.]

LUMBRI'CUS. The genus *Lumbricus* of Linnæus consisted not only of the *Earth-worms*, properly so called, but of an Intestinal worm or *Entozoon* (var. Intestinalis γ), the *Ascaris lumbricoides*, which so often infests children, and the *Lumbricus marinus* or *Lug* of our shores, so much in request by fishermen as a bait for sea-fish. The genus, as he left it, comprised only the two species *terrestris* and *marinus*, and is arranged under his *Vermes* (Intestina), between *Ascaris* and *Lumbricus*.

Lamarck and Cuvier both place the genus *Lumbricus* among the Annelids.

The former makes the *Echiurées* or *Lombricinés* the second family of his *Apod Annelids*. He observes that they have in truth projecting bristles (soies) externally; but these bristles, rarely fasciculated, are not retractile, have no sheath, nor are they furnished with pediform mamillæ, serving as a case for bundles of retractile bristles, as in all the Annelids of Lamarck's two following orders, the *Antennate Annelids* and the *Sedentary Annelids*.

Lamarck states that he formed this family at the expense of the genus *Lumbricus* of Linnæus, or rather of a part of that genus; but he adds that, in the then imperfect state of the knowledge of their internal organization, he considers his labours as imperfect and provisional only. He assigns to this family as a habitat moist earth and the mud or sand (vase) of the sea, and states that their branchiæ are not known. The three genera placed by him under this family are *Lumbricus*, *Thalassema*, and *Cirratulus*. To these the editor of the last edition adds *Sternapsis*, and expresses his opinion that Savigny's genus *Ophelia* ought to be arranged near *Cirratulus*.

Cuvier makes the *Abranchiata* (Les Abranches) the third order of the Annelids, and the *Setigerous Abranchiata* (Abranches Sétigerès, ou Pourvues de soies) the first order of that family. The order consists of the genera *Lumbricus* and *Nais*. It is to the first of these genera that we are to call the attention of the reader, and it is characterized by a long cylindrical body divided by wrinkles into a great number of rings, and by a mouth without teeth. Cuvier remarks that the *Lumbrici* ought to be subdivided; and Savigny has, in effect, subdivided the Earth-worms into the genera *Enterion*, *Hypogæon*, and *Clitellio*. MM. Audouin and Milne Edwards distinguish also the genus *Trophonia*.

Of these *Enterion* has upon each ring four pairs of small bristle-like processes, eight in all.

Clitellio is stated to have two bristle-like processes only on each ring.

Hypogæon has, besides the other bristle-like processes, one on the back of each ring. (This form is noticed as being American only.)

Trophonia has on each ring four bundles of short bristle-like processes, and at the anterior extremity a great number of long and brilliant bristle-like processes which surround the mouth.

Savigny described upwards of twenty species, which he considers to be distinct, and to have been confounded previously under the name of *Lumbricus terrestris*. M. Morren, in his 'Treatise on the Natural History and Anatomy of the *Lumbricus terrestris*' (Brussels, 1829), appears to be doubtful with regard to the number of species described by Savigny and others, and inclines to the opinion that they are merely varieties. M. Milne Edwards (edit. of Lamarck's *Animaux sans Vertèbres*, 1838) considers the characters on which Savigny relied as distinctions for dividing the group into the three genera as of little importance.

We take as an example the *common Earth-worm* (*Lumbricus terrestris* of Linnæus).

ORGANIZATION.

Eternally the Earth-worm presents a body composed of numerous narrow rings closely approximated to each other; at about one-third of their length may be seen, particularly at the season of reproduction, the *clitellum*, which becomes at that time a highly important agent. The colour of the body is reddish or bluish, and of a shining aspect, and the animal has the power of secreting a viscous substance, which forms a sort of protecting sheath to its body, and greatly facilitates its progress through the earth. The animal is eyeless, and unprovided with either tentacles, branchiæ, or cirrhi.

Respiratory System.—The generally received opinion is that the blood of the Earth-worms is aërated by means of lateral series of small pyriform vesicles, analogous to the breathing sacs of the Leech [LEECH, vol. xiii., p. 382], and opening externally by very minute pores.

Digestive System.—The mouth consists of two lips without tentacles or armature of any description; but the upper lip is elongated and proboscidiform. The œsophagus, which is a wide membranous canal, is continued straight down for half an inch, and ends in a dilated bag or reservoir, to which succeeds a muscular stomach or gizzard, disposed in the form of a ring. The intestine is constricted at each segment of the animal by a series of ligaments or partitions, connecting it to the parietes of the body, and swells out the intermediate spaces, when distended by the particles of earth. (See the *Catalogue of the Physiological Series of Comparative Anatomy in the Museum of the Royal College of Surgeons in London*, vol. i., and the preparation in the Gallery, No. 470.)

Nervous System.—The nervous system of the Earth-worm consists of a series of small ganglions close to each other. In the Museum of the College of Surgeons is a preparation, No. 1296 (*Gallery, Phys. Series*), illustrative of this system. It is an Earth-worm (*Lumbricus terrestris*, Linn.) with the ventral parietes of the abdomen removed to show the nervous chords, their ganglions, and lateral branches. The divergence of the two main lateral chords, in order to pass to the dorsal aspect of the œsophagus, is clearly shown (*Cat.*, vol. iii., part 1).

Generative System.—Allotriandrous, or with male organs so disposed as to fecundate the ova of a different individual. (Owen.) Cuvier was of opinion that they were hermaphrodites, but that it was possible that their junction only served to excite each other to fecundate themselves. It has been doubted whether these animals are oviparous, ovoviviparous, or viviparous. M. Montègre and Sir Everard Home supposed them to be viviparous. M. Leon Dufour (1825 and 1828) asserts that they are oviparous, in which opinion he is joined by M. Dugès (1828), who believes that the living vermicular animals which M. Montègre took for young *Lumbrici* were intestinal worms only. M. Morren, in the work above alluded to (1829), states that the mode of reproduction is both oviparous and ovoviviparous: that is, we apprehend, the animal under certain unfavourable circumstances will, like the viper, deposit the eggs, instead of hatching them internally. The statement of M. Montègre is that the eggs descend between the intestine and the external envelope to the circumference of the rectum (jusq' autour du rectum), where they are hatched, according to Cuvier, the young making their exits from the anus. M. Dufour, on the contrary, says that they produce eggs analogous to those of the leeches. In the Museum of the College of Surgeons (*Gallery, Phys. Series*, No. 2294), the anterior moiety of an Earth-worm (*Lumbricus terrestris*, Linn.) is shown with the parietes of the body slit open along the back, and the two halves divaricated, so as to expose the alimentary canal, testes, and ovaries. Four portions of black bristle indicate the four testes, which are the small white globular bodies immediately exterior to the bristles, two on each side. The ovaria are the larger oval bodies, of a less pure white than the testes, in the interspace between the bristles. They are four on each side, and increase in size as they are situated more posteriorly. Each of these essential organs of reproduction has a separate external aperture, which is very minute; and impregnation takes place by the apposition of the genital outlets of one individual to those of another, without intromission, as in the leech. In this state two Earth-worms are preserved in a succeeding series (Owen., *Cat.*, vol. iv.); Nos. 2295 and 2296 are also preparations illustrative of the organs of generation in these animals.

Organs of Progression.—Earth-worms creep at a good pace by means of muscular contraction and dilatation acting on the rings, which carry on their under-side the bristle-like processes above mentioned: these last operate as feet. The power of elongation is considerable, and the anterior part of the animal acts as a sort of awl in penetrating the earth.

Habits, &c.—The Earth-worm, as far as relates to its appearance above the surface of the ground, may be considered almost a nocturnal animal. In the night-season and at early morning hundreds may be seen, though not one, unless they are disturbed either by moving the ground or pouring liquids into their holes, is to be found moving about in the day. The power of reproducing parts after mutilation is, as most must have noticed, very great in this animal.

Utility to Man.—The worm-casts, which so much annoy the gardener by deforming his smooth-shaven lawns, are of no small importance to the agriculturist; and this despised creature is not only of great service in loosening the earth and rendering it permeable by air and water, but is also a most active and powerful agent in adding to the depth of the soil, and in covering comparatively barren tracts with a superficial layer of wholesome mould. In a paper 'On the Formation of Mould,' read before the Geological Society of London, by Charles Darwin, Esq., F.G.S., the author commenced by remarking on two of the most striking characters by which the superficial layer of earth, or, as it is commonly called, vegetable mould, is distinguished. These are, its nearly homogeneous nature, although overlying different kinds of subsoil, and the uniform fineness of its particles. The latter fact may be well observed in any gravelly country, where, although in a ploughed field, a large proportion of the soil consists of small stones, yet in old pasture-land not a single pebble will be found within some inches of the surface. The author's attention was called to this subject by Mr. Wedgwood, of Maer Hall, in Staffordshire, who showed him several fields, some of which, a few years before, had been covered with lime, and others with burnt marl and cinders. These substances, in every case, are now buried to the depth of some inches beneath the turf. Three fields were examined with care: the first consisted of good pasture-land, which had been limed, without having been ploughed, about twelve years and a half before; the turf was about half an inch thick; and two inches and a half beneath it was a layer or row of small aggregated lumps of the lime, forming, at an equal depth, a well-marked white line. The soil beneath this was of a gravelly nature, and differed very considerably from the mould nearer the surface. About three years since cinders were likewise spread on the field; these are now buried at the depth of one inch, forming a line of black spots parallel to and above the white layer of lime. Some other cinders, which had been scattered in another part of the same field, were either still lying on the surface or entangled in the roots of the grass. The second field examined was remarkable only from the cinders being now buried in a layer, nearly an inch thick, three inches beneath the surface. This layer was in parts so continuous, that the superficial mould was only attached to the subsoil of red clay by the longer roots of the grass.

The history of the third field is more complete. Previously to fifteen years since it was waste land; but at that time it was drained, harrowed, ploughed, and well covered with burnt marl and cinders. It has not since been disturbed, and now supports a tolerably good pasture. The section here was turf half an inch, mould two inches and a half, a layer one and a half inch thick, composed of fragments of burnt marl (conspicuous from their bright red colour, and some of considerable size, namely, one inch by half an inch broad, and a quarter thick), of cinders, and a few quartz pebbles mingled with earth; lastly, about four inches and a half beneath the surface was the original black peaty soil. Thus beneath a layer (nearly four inches thick) of fine particles of earth, mixed with some vegetable matter, those substances now occurred, which, fifteen years before, had been spread on the surface. Mr. Darwin stated that the appearance in all cases was as if the fragments had, as the farmers believe, worked themselves down. It does not however appear at all possible that either the powdered lime or the fragments of burnt marl and the pebbles could sink through compact earth to some inches beneath the surface, and still remain in a continuous layer; nor is it probable that the decay of the grass, although adding to the surface some of the constituent parts of the mould, should separate in so short a time the fine from the coarse earth, and accumulate the former on those objects which so lately were strewed on the surface. Mr. Darwin also remarked that near towns, in fields which did not appear to have been ploughed, he had often been surprised by finding pieces of pottery and bones some inches below the turf. On the mountains of Chile he had been perplexed by noticing elevated marine shells, covered by earth, in situations where rain could not have washed it on them.

The explanation of these circumstances, which occurred to Mr. Wedgwood, although it may at first appear trivial, the author does not doubt is the correct one, namely, that the whole is due to the digestive process by which the common Earth-worm is supported. On carefully examining between the blades of grass in the fields above described, the author found that there was scarcely a space of two inches square without a little heap of the cylindrical castings of worms. It is well known that worms swallow earthy matter, and that, having separated the serviceable portion, they eject at the mouth of their burrows the remainder in little intestine-shaped heaps. The worm is unable to swallow coarse particles; and as it would naturally avoid pure lime, the fine earth lying beneath either the cinders and burnt marl, or the powdered lime, would, by a slow process, be removed and thrown up to the surface. This supposition is not imaginary, for in the field in which cinders had been spread out only half a year before, Mr. Darwin actually saw the castings of the worms heaped on the smaller fragments. Nor is the agency so trivial as it at first might be thought, the great number of Earth-worms (as every one must be aware who has ever dug in a grass-field) making up for the insignificant quantity of work which each performs.

On the above hypothesis, the great advantage of old pasture-land, which farmers are always particularly averse from breaking up, is explained; for the worms must require a considerable length of time to prepare a thick stratum of mould, by thoroughly mingling the original constituent parts of the soil, as well as the manures added by man. In the peaty field, in fifteen years, about three inches and a half had been well digested. It is probable however that the process is continued, though at a slow rate, to a much greater depth; for as often as a worm is compelled by dry weather or any other cause to descend deep, it must bring to the surface, when it empties the contents of its body, a few particles of earth. The author concluded by remarking that it is probable that every particle of earth in old pasture-land has passed through the intestines of worms, and hence that in some senses the term 'animal mould' would be more appropriate than 'vegetable mould.' The agriculturist, in ploughing the ground, follows a method strictly natural; and he only imitates in a rude manner, without being able either to bury the pebbles or to sift the fine from the coarse soil, the work which nature is daily performing by the agency of the Earth-worm.

Since this paper was read Mr. Darwin has received from Staffordshire the two following statements:—1. In the spring of 1835 a boggy field was so thickly covered with sand that the surface appeared of a red colour, but the sand is now overlaid by three-quarters of an inch of soil. 2. About eighty years ago a field was manured with marl, and it has been since ploughed, but it is not known at what exact period. An imperfect layer of the marl now exists at a depth, very carefully measured from the surface, of twelve inches in some places and fourteen in others, the difference corresponding to the top and hollows of the ridges or butts. It is certain that the marl was buried before the field was ploughed, because the fragments are not scattered through the soil, but constitute a layer which is horizontal, and therefore not parallel to the undulations of the ploughed surface. No plough, moreover, could reach the marl in its present position, as the furrows in this neighbourhood are never more than eight inches in depth. In the above paper it is shown that three inches and a half of mould had been accumulated in fifteen years; and in this case, within eighty years (that is, on the supposition, rendered probable from the agricultural state of this part of the country, that the field had never before been marled) the Earth-worms have covered the marl with a bed of earth averaging thirteen inches in thickness. (*Proceedings of the Geological Society of London*, vol. ii., 1837-38.)

LUMME, a name for the bird called the *Speckled Diver*, or *Speckled Loon* (*Colymbus Arcticus*, Linn.).

LUNACY. Unsoundness of mind is perhaps the most accurate definition of the present legal meaning of this term that can be given. Formerly a distinction was made between lunatics and idiots; a lunatic being described as one who has had understanding, but from some cause has lost the use of his reason; and an idiot, as one who has had no understanding from his nativity. The distinction between these two classes of persons of unsound mind also produced some important differences in the management of their property. These have now fallen into disuse, and therefore it will be sufficient for the purposes of this article to consider the consequences to the individual of unsoundness of mind generally. Strictly speaking, perhaps a lunatic is one who has lucid intervals, but this distinction may also at the present day be disregarded.

Persons of unsound mind may inherit or succeed to land or personal property either by representation, devise, or bequest, but they cannot be executors or administrators, or make a will, or bind themselves by contract. It is stated by Blackstone that the conveyances and purchases of persons of unsound mind are voidable, but not actually void; this however perhaps needs some qualification, for a bargain and sale, or surrender, &c., and also personal contracts made or entered into by such persons, are actually void as against their heirs or other representatives, though it is true a feoffment with livery of seisin was voidable only. [CONVEYANCES.] A person of unsound mind, though he afterwards be restored to reason, is not permitted to allege his own insanity in order to avoid his own act; for no man is allowed to stultify himself, or plead his own disability (13 Vesey, 590), unless he has been imposed upon in consequence of his mental incapacity (2 Carr. & P. 178; 3 Carr. & P. 1, 30); and an action will lie against a lunatic upon his contract for necessaries suitable to his station. The reader is referred for information upon this subject to 1 Blackst. *Comm.*, 291; 1 Fonbl. *Eq.*, b. 1, c. 2; 2 Sugd. *Pow.*, 295-6; 5 Barn. & C. 170; Moody & M. 105, 6. Acts done during a lucid interval are valid, but the burthen of proving that at the time when the act was done the party was sane and conscious of his proceedings, lies upon the person asserting this fact. The marriage of a person of unsound mind, except it be solemnized during a lucid interval, is void.

The degree of responsibility under which persons of unsound mind are placed with respect to crimes committed by them, as well as the degree of unsoundness of mind which should be considered as depriving the party of that amount of self-control which constitutes him a responsible agent, are in a painful state of uncertainty. As a general rule it may however be laid down that where unsoundness of mind, of such a nature as to render the party incompetent to exercise any self-control, is established, criminal punishment will not be inflicted; but that he will be kept in safe custody during the pleasure of the crown (39 & 40 Geo. III., c. 94, and 1 & 2 Vict., c. 14). On the subject of criminal responsibility, and what constitutes unsoundness of mind in a legal point of view, the reader is referred to the various treatises on medical jurisprudence, particularly to that by Dr. Ray, lately published at Boston in the United States: and also generally to Dr. Haslam's 'Observations on Madness and Melancholy,' 'Medical Jurisprudence as it relates to Insanity,' 'Illustrations of Madness,' and his other works. The following remarks may however be useful.

In lunacy the question to be decided is not whether the individual be actually of sound mind, though a jury on an inquisition held under a commission of lunacy must express their opinion or finding in the form that the alleged lunatic is of 'unsound mind' (*In re Holmes*, 1 Russell, 182); but though such must be the finding in order to make a man legally a Lunatic, the real question is whether or not the departure from the state of sanity be of such a nature as to justify the confinement of the individual, or the imposition of restraint upon him as regards the disposal of his property. No general rule can be laid down by which to ensure a right decision: but in all such inquiries it should be kept in mind that insanity varies infinitely in its forms and degrees. It should be particularly remembered that persons may be of weak mind, and eccentric, and even be the subjects of delusions on certain subjects, and yet both inoffensive and capable of directing pecuniary matters. The individual's natural character should be taken into consideration as accounting for eccentricities of manner and temper, and his education in estimating his ignorance and apparent want of intellect; and lastly due allowance must be made for the irritation and excitement produced in a mind, perhaps naturally weak, by the inquiry itself, and the attempt to deprive him of his liberty and property. Confidence should not be placed in depositions or evidence founded on short and inattentive examinations.

Sometimes the madman conceals his disease, and with such remarkable cunning and dissimulation that the detection of it is very difficult: this is more particularly the case when the insanity consists in some hallucination; and here, unless the nature of the delusion be known, it will often be in vain to attempt to elucidate by questions any proof of unsoundness of mind. Those who are insane on particular subjects will reason correctly on ordinary and trivial points, provided these do not become associated with the prevailing notions which constitute their disease.

When insanity is urged as the ground of non-responsibility for a criminal act, it has been erroneously held that the main point to be ascertained is, whether the individual has or had 'a sense of good and evil,' 'of right and wrong.' But this, though the doctrine of the English law, is found incapable of practical application; and the records of trials of this kind show that the guide to the decision has generally been the proof, or absence of proof, that insanity of some kind existed at the time of the act, although before and after it the power of reasoning and the knowledge of right and wrong might be retained. Thus, on the trial of Hatfield for shooting at George III., Erskine argued that the existence of a delusion in the mind absolves from criminal responsibility, if it be shown that the delusion and criminal act were connected; and on this principle Hatfield was acquitted, but confined for life. Bellingham however, who shot Mr. Percival under an equally powerful delusion, in consequence of the greater excitement in the public mind occasioned by the result of the insane act, was convicted and executed. In many instances homicide has been prompted, not by any insane hallucination or delusion, but by a morbid impulse to kill. Here there is generally evidence of the feelings and propensities of the individual having been previously disordered, of his being in fact the subject of moral insanity [Insanity], and judgment in such cases is aided by the absence of motive to the act. Where the general conduct of the prisoner has been such as to indicate unsoundness of mind, even though considerable contrivance has accompanied the act, or where there is evidence of his having been the subject of an irresistible impulse to kill, it is becoming now the practice to find a verdict of acquittal, in opposition to the older authorities, who confined the exemption from responsibility on the ground of insanity within very narrow limits.

A lunatic is, according to law, responsible for acts committed during 'lucid intervals,' a term by which is understood however, not mere remissions of the violence of the disease, but periods during which the mind resumes its perfectly sane condition. In forming an opinion concerning such lucid intervals, it is to be remembered that the absence of the signs of insanity must have considerable duration before it can be thence concluded that the mind is perfectly sane; and that lunatics, when apparently convalescent, are subject to sudden and violent paroxysms.

One of the most difficult points to be determined is with regard to the mental capacity of old persons, in whom the mind is confessedly impaired. The decay of intellect in old age is first manifested in the loss of memory of persons, things, and dates, and particularly with respect to recent impressions. But it is not the mere liability to forget names, &c., which will render the will of an old person invalid; it should be shown that in conversation about his affairs, and his friends and relations, he did not evince sufficient knowledge of both to dispose of the former with sound and untrammelled judgment. Many old men appear stupid and forgetful, but when their attention is fairly fixed on their property, business, and family affairs, understand them perfectly, and display sagacity in their remarks.

The care and custody of idiots and lunatics form a branch of the royal prerogative, and were formerly administered by the king himself. Since the dissolution of the Court of Wards, the lord chancellor has been specially appointed to exercise this power. [Chancellor.] The method of proving a person to be of unsound mind, for the purpose of depriving him of the control of his property, and, where the circumstances require it, providing for the safe custody of his person, is as follows. The lord chancellor upon petition supported by affidavits, and in some cases upon a personal interview also with the alleged lunatic, when such a course seems necessary, grants a commission to inquire into the state of mind of the party, and if the jury should find him to be *lunatic* or of *unsound mind* (one of which modes of finding is absolutely necessary), the care of his person is committed to some relation or other fit person with a suitable allowance for maintenance, who is called the committee of the person; and the care of the estate is committed either to the same or some other person, who is called the committee of the estate. [Guardian.] The commission is a proceeding issuing from the common-law side of the Court of Chancery; but after the appointment of the committee, the chancellor acts by virtue of his general authority, and his orders are enforced by the general process of the court. The committee of the estate is considered as a mere bailiff appointed by the crown for the sole interest of the owner, and without any regard to his successors; but the court will order allowances to be made to near relations of the party who is of unsound mind, and even to his natural child, where the circumstances of the several parties justify and require it, and will direct proper acts to be done in the management of the estate, as repair of buildings, felling of timber which is deteriorating, &c.

On the general subject see Stock *On the Law of Non Compotes Mentis*; and Collinson *On Lunacy*.

LUNAR OBSERVATION generally means an observation of the moon's distance from a star, for the purpose of finding the longitude. [Longitude and Latitude, Methods of Finding.]

LUNAR THEORY. By the theory of a planet is meant the deduction of its motion from the law of gravitation. This subject is discussed in the article Gravitation. For the numerical data see Moon.

LUNATIC. [Lunacy.]

LUNATIC ASYLUMS. Besides the large endowed hospitals (as the Bethlehem) and county asylums, there are numerous private establishments for the reception of the insane. In the cities of London and Westminster, and seven miles around, and in the county of Middlesex, these asylums are under the direct jurisdiction of the Metropolitan Commissioners of Lunacy, who are appointed annually by the lord chancellor for the purpose of licensing and visiting such houses. The commissioners are in number not less than 15 and not more than 20: four or five must be physicians, and two barristers. In other parts of England similar powers of granting licences and appointing visitors are delegated to the justices in general or quarter-sessions; but notices of all such licences are forwarded to the office of the metropolitan commissioners.

No person can be admitted into a house kept for the reception of the insane without a certificate signed by two medical men, not interested in the profits of the establishment, who must have separately visited and examined the patient within seven days before his admission into the asylum; or, upon satisfactory reasons being shown, the certificate may have the signature of one medical man only, but then it must be signed by a second within seven days after the patient's admission.

A variety of statutes have been passed for the management and regulation of houses for the reception of persons of unsound mind, and of county lunatic asylums for the maintenance of pauper and criminal lunatics, the last of which is 3 & 4 Will. IV., c. 64, continued by 1 & 2 Vict., c. 73.

(For the treatment of lunatics see INSANITY.)

LUNATION, the time between two new moons. [MOON.]

LUND is a town in Sweden, in the province of Scane and Län of Malmohus, in 55° 40′ N. lat. and 13° 10′ E. long., about seven miles from the Sound. It is situated in the centre of an extensive plain of great fertility, which produces richer crops of wheat than any other district of Sweden: tobacco and madder are also raised in it. The streets are straight and wide, and the houses commonly of two floors, and many of them surrounded by orchards and gardens. In the centre of the town is the cathedral, a large and magnificent building of hewn stone. Lund is the seat of a bishop, and has a celebrated university. Between the cathedral and the university buildings is a space planted with lime-trees, and kept in good order. The university buildings, erected in 1668, consist at present of two extensive edifices, the old and new one. The former, which is the larger, is three stories high, and has a tower. In the ground-floor is the historical museum; there are also two lecture-rooms. In the second floor is the library, which consists of nearly 40,000 volumes, among which are a few valuable manuscripts. In the third floor is the lecture-room for mathematics, and the collection of instruments. The observatory is in the tower. The new university building contains the meeting-rooms of the senate and of the four faculties, and likewise the archives; in the second floor are the collections of natural history. The chemical laboratory is in a separate building. There is a botanical garden belonging to the university. In the building attached to it is the lecture-room for botany, and in the upper floor the lecture-room for anatomy, with numerous preparations. Near the botanical garden is a plantation called Paradislycka, in which foreign forest-trees are grown for sale, and transplanted to other parts of the kingdom. The number of students amounted in 1830 to 632; the population of the town, according to the census of 1825, is nearly 4000, and it is supposed that it now exceeds 4500 souls. An active commerce in the produce of the adjacent country is carried on between Lund and Malmö. (Forsell's *Statistics of Sweden;* Schubert, *Reise durch Schweden, Norwegen,* &c.)

LUNDIN, SIR ALAN, of Lundin, or Lundie, in the shire of Forfar, was son and heir of Thomas de Lundin, who held the office of king's hostiarius, or door-ward, and was one of the magnates Scotiæ who ratified the marriage of king Alexander II. with Joanna of England. Sir Alan early married the bastard daughter of this king Alexander, and before the year 1233 he had succeeded his father in the office of Durward. Before this time also he had imitated his father's munificence to the church, and in the spirit of the age had founded a Dominican convent at Montrose. He was a forward impetuous character, and for twelve years assumed without any authority the title of earl of Athol.

In 1243 he was appointed lord-justiciar of Scotland, and so continued for about six years, when he was removed under circumstances which strongly mark his audacity and ambition. In 1249 he endeavoured to obstruct the coronation of the infant son of king Alexander II.; and the next year he prevailed on Robert, abbot of Dumfermline, then chancellor of the kingdom, to make a motion in council to legitimate his wife, so that on failure of issue of the king's body she and her heirs might succeed to the throne. For this act the king conceived so great a displeasure that he immediately turned the chancellor out of office, and soon after the justiciar likewise. The latter joined King Henry III. in France, and served in his army; and at length, in 1255, by the influence of the English king, he was re-instated in his office of lord-justiciar, and so continued till 1257, when he was again removed for the powerful Comyn. He died in 1275, leaving three daughters, who carried his great possessions with his blood into other families. Fordun calls him 'vir dapsilis et strenuissimus in armis, et regi et regno fidelissimus.'

LUNDY ISLAND. [DEVONSHIRE.]

LUNE, LUNULE, the figure formed on a sphere or on a plane by two arcs of circles which enclose a space. [HYPOTHENUSE; SPHERE.]

LUNE (River). [LANCASHIRE.]

LÜNEBURG is an antient allodium of the house of Brunswick, which, in the year 1235, was raised, together with Brunswick, to the rank of a duchy, and was subsequently separated, and formed a distinct principality. In recent times it lost the bailliwick of Klötze, which was ceded to Prussia, but was indemnified by the addition of that part of Lauenburg which was retained by Hanover. It is now a landdrostei, or province, of the kingdom of Hanover, situated between 52° 15′ and 53° 30′ N. lat. and 9° 16′ and 11° 40′ E. long. It is bounded on the north by the Elbe, which separates it from Holstein, Hamburg, and Lauenburg; on the north-east by Mecklenburg-Schwerin and the Prussian province of Brandenburg; on the east by the province of Saxony; on the south-east and south by Brunswick and Hildesheim; and on the west by Calenberg. The shape is near a square, and the area 4080 square miles. The population, according to the latest census, is 306,146. The country is on the whole an immense sandy plain, which is broken by some chains of low hills. This tract is chiefly covered with heath, with here and there extensive turf moors, and considerable woods, mostly of fir. Fertile arable land is rare, but on the banks of most of the rivers, especially the Elbe and the Aller, there is very rich marsh-land. It was calculated twenty years ago that at least seven-tenths of the whole province were covered with heath and brake; for of 4,172,642 Calenberg acres which Lüneburg contains, only 560,467 acres were arable land, 174,522 acres pasture, and 492,000 acres forests. On the banks of the smaller rivers the land is in many parts well cultivated; for instance, about Lüchow and Uelzer, where flax of good quality is grown. The principal river is the Elbe, which runs along the frontier; only the bailliwick of Neuhaus lies beyond that river, which receives from the province itself the Ilmenau, with its affluents the Wipperau, Lühe, Seve, and Netze; and the Aland and Ieeze, which come from the Altmark. The Ohre and the Este rise in Lüneburg, the former running into the province of Brandenburg, and the latter towards Bremen. The Aller, in the south of the province, with its tributaries the Oker, Fuse, Oerze, and Böhme, belongs to the valley of the Weser. The country has a very gradual fall towards the Elbe and the Weser, especially towards the former, against the inundation of which the land is secured by dikes. The highest land between the two rivers is the celebrated Lüneburg Heath. This tract, which has been called the desert Arabia of Germany, has some villages and seats of rich landowners on the small streams, who enjoy very extensive rights of common on this heath. The breed of small coarse-woolled sheep, called Heideschnucken, which a French traveller mistakes as the name of a peculiar race of people, *le peuple des Heideschnucks*, is kept on this heath. The villagers derive their chief subsistence from the breeding of bees and gathering bilberries, juniper-berries, and cranberries, of which vast quantities are sent to Hamburg and Bremen. The heath is so favourable to the breeding of bees, that many thousand beehives are sent thither from other parts of the kingdom. The cultivation of the soil has made of late years considerable progress. As it is only in the rich marshlands that good crops of corn can be raised, there is scarcely sufficient for the population. Flax is pretty extensively cultivated. The land produces also hops, potatoes, garden vegetables, and turnips in abundance, but only a little fruit. The breeding of cattle is more profitable than tillage; the sheep are very numerous, but their wool is in general indifferent. The breed of horses has been very much improved by the national stud at Celle. The forests afford timber for building as well as fuel, for which there is a good sale. Gypsum abounds in many places; and in the vicinity of the gypsum are the celebrated saline springs. Near Lüchow there is a district called Drawän, or Wendland, the inhabitants of which, in their language and manners, retain traces of their descent from the Wends. The main road for commerce between Hamburg and the interior of Germany passes through this principality. The staple town is Lüneburg, and the inhabitants expect to derive great advantages from the privilege just granted to the city by his present majesty, to hold three annual fairs. The traffic from Hamburg by way of Harburg and Celle, from Bremen by way of Celle, and from Lübeck by way of Lüneburg, is not so considerable. There are no manufactures, properly so called, except at Lüneburg, Harburg, and Celle. Spinning of yarn, linen-weaving, and stocking-knitting are pretty general among the country-people, who likewise make a quantity of wooden wares. In general the inhabitants are in pretty easy circumstances.

LÜNEBURG, the capital, lying in 53° 15′ N. lat. and 10° 17′ E. long., is situated on the Ilmenau, which is here navigable about fifteen miles above its junction with the Elbe, and has 13,000 inhabitants. At the western end is the Kalkberg, the highest mountain in the country (about 350 feet high), on which the convent of St. Michael and some fortifications were erected in the tenth century. At present 20,000 tons of lime are annually procured from the Kalkberg, and exported to Hamburg and Holland. Lüneburg was formerly surrounded with walls, but the fortifications are now dismantled. The principal buildings and public institutions are the royal palace, the gymnasium, St. Michael's church, in the vaults of which are the monuments of the antient princes, the convent of St. Michael, with a Latin school, the town-hall, the arsenal, an hospital, &c. The inhabitants carry on a considerable trade in the products of the country, such as linen, salt, wax, honey, woollens, linen thread, flax, horses, of which 70,000 are annually brought hither to market, &c. There are very productive salt-works in a part of the city which is separated from the rest by a wall, and is called the Sulze. The spring from which the salt is obtained is very strong, being perfectly saturated, and yields 200,000 cwt. annually, and would yield much more. We have already spoken of the transit trade from Hamburg to the interior. There are manufactories of soap, snuff, playing-cards, some breweries and distilleries, a paper-mill, &c. Of the other towns in the principality the most important are Celle (otherwise Zell), a tolerably well-built town, at the junction of the Fuse and the Aller, the seat of the supreme court of appeal; it has a gymnasium, a national stud, with 120 stallions, a large house of correction, six churches, and many other public buildings and institutions. The suburbs are very extensive. On the west side of the town is a palace, with a magnificent chapel, and in the French garden is the monument of Matilda, queen of Denmark, sister of George III. of England. Harburg, on the Elbe, opposite Hamburg, has some manufactories of linen, woollens, and stockings, a powder-mill, tanneries, wax-bleaching, sugar-refinery, and a great trade in timber. Uelzen in the Heath, on the Ilmenau, has 3000 inhabitants, who cultivate the best flax, and have manufactories of woollen cloth, camlets, and starch.

LUNEL. [HE'RAULT.]

LUNETTE, in fortification, is a work similar to a ravelin, or demi-lune, but generally of smaller dimensions. Such works have been placed in the retired angles between the ditches of a bastion and of the collateral ravelin, but they are now usually considered as advanced works, and are placed in front of those just mentioned.

The form of a lunette is the same as that of the redoubt Y in the plan at the end of the article FORTIFICATION; and its positions may be understood by conceiving such works to be placed beyond the glacis S S on lines passing through P and Z, X and R, and produced. Each lunette is protected in front by a ditch, beyond which is a covered-way, as usual.

The best disposition for a series of such works is that in which they are alternately more and less advanced beyond the fortress; since then they afford one another a reciprocal defence by the crossing fires which may be kept up from the nearest faces of every salient and retired lunette. And should the besiegers succeed in carrying their approaches up the glacis of the latter, the artillery on the flanks of the two more salient and collateral lunettes would effectually prevent them from forming a battery on its crest to breach the work. The operations against any one retired lunette must consequently be postponed till the two collateral lunettes are taken; whereas had all been equally advanced beyond the fortress, the three might have been breached and assaulted at the same time.

To give the more advanced lunettes, which are generally those placed beyond the ravelins, all the advantages of which they are susceptible, the magistral lines of their faces should coincide with the sides of an equilateral triangle whose base is a line joining the faces of the two collateral bastions at points about twenty or thirty yards from their flanked angles; for thus the earthen parapets at the salient angles of the lunette will not be easily destroyed by rain, and the ditches before the faces of the work can be defended by two or more pieces of artillery conveniently placed on the faces of the bastions. The ditches of the retired lunettes should in like manner be defended by artillery placed on the faces of the collateral ravelins; and the magistral lines of their faces should consequently be directed towards such ravelins.

In a front of fortification of the ordinary extent (350 yards) this rule for placing the advanced lunette will permit the ditch and covered-way of the latter to be defended by a fire of musketry from the retired places of arms L L [FORTIFICATION], and from the covered-way before the bastions; and, that such fire may graze the bottom of the ditch of the lunette, this ditch ought to be in an inclined plane nearly coinciding with the slope of the glacis S S. Should the ditch so formed be too shallow to fulfil its end, which is that of being an obstacle to the enemy in his attempt to assault the lunette, it would be necessary to make it deeper; and that it might not thus become a trench in which the enemy would be covered from the fire of the defenders, it should communicate with water, by which it might be filled previously to the expected assault.

The rampart of a lunette differs in no respect from that of other works; it should have the same relief, or height above the natural ground, as is given to the ravelins; since, as in the latter work, the fire of artillery should be capable of being directed against the trenches of the enemy at the foot of the glacis, over the heads of the defenders on the banquette of the covered-way. Its escarp should be revêted with brick or stone, in order that the enemy may be compelled to form a breach in it by artillery, or by a mine, previously to making an assault; or at least that the attack by escalade might be a process of difficulty and danger. The terreplein, or ground in the interior, should be high enough at the gorge to prevent an enemy from entering there without scaling-ladders; this part should be further protected by a loop-holed wall, or a line of palisades; it should be seen and defended from some collateral work, and an open caponnière, or a subterranean gallery, for communication, should lead from the gorge of each lunette to the place of arms in its rear. The advanced covered-way should pass in front of all the lunettes, and it might terminate at the two extremities on inaccessible ground, or in the general covered-way of the place.

Advanced lunettes about a fortress form strong posts for artillery, by which an enemy is compelled to commence his approaches at a greater distance than would otherwise be necessary. The length of their faces may be from sixty to seventy yards, and that of their flanks from fifteen to twenty. It is considered that a well-disposed series of these works would prolong the defence of a place about ten or twelve days. But they are only proper for fortresses of the first magnitude, since they would require a large garrison; and the troops, on being compelled to retire, might not find sufficient room in a small place.

LUNE'VILLE, a town in France, capital of an arrondissement in the department of Meurthe, 186 miles from Paris in a direct line east by south, or 221 miles by the road through Châlons sur Marne, Bar le Duc, and Nancy. This place appears to have been a mere village before the eleventh century. It afterwards became a fortified town, and the capital of a county. In the war between Charles le Téméraire, duke of Bourgogne, and René II., duke of Lorraine, it was taken and re-taken. In the year 1638 it was taken by the French, who demolished the fortifications. Leopold, duke of Lorraine, rebuilt the castle at the commencement of the last century, and made it his residence.

A fire destroyed part of the castle, A.D. 1720, but it was promptly restored. A second fire (A.D. 1755) destroyed one of the wings, which has been rebuilt of late years. This castle was the usual residence of Stanislaus, ex-king of Poland, and duke of Lorraine: it now serves as a cavalry barrack, and is capable of accommodating 4000 horses. The park and gardens have become public walks, and in the 'Champ de Mars,' or exercise-ground, a cavalry exercise camp is formed every year. There is a covered riding-school for cavalry, 520 feet long by 85 wide, without pillars to support the roof, in which 400 men can exercise at one time. The town was much improved by the dukes Leopold and Stanislaus. The streets are for the most part wide and straight. There are three suburbs, those of Nancy, of Viller, and of Alsace. There are two bridges over the Vezouze, on which the town stands, and near the town are two others over the Meurthe, into which the Vezouze falls just below Lunéville. The parish church is a modern building of elegant architecture; the portal however is overcharged with figures and ornaments; two towers rise above the portal, crowned with statues, the one of St. Peter, the other of Michael the archangel casting down Satan. The Place Neuve (New Square) is ornamented with handsome buildings. The population of Lunéville in 1831 was 12,378 for the town, or 12,341 for the whole commune; in 1836 it was 12,798 for the commune. The inhabitants are engaged in spinning cotton and woollen yarn, weaving woollen cloth and cotton goods; manufacturing silk, cotton, and worsted hose; in making embroidery, pins, hats, earthenware, iron stoves, and especially leather and gloves. There are several tanneries. The principal trade is in the above articles; also in grain, wine, brandy, flax, hemp, seeds, and fruit grown in the gardens round the town. There are six yearly fairs. There are several government offices, a high-school, an agricultural society, two hospitals or asylums (one of them for orphans), a Jews' synagogue, and a theatre. Charles Alexander of Lorraine, an Austrian general of reputation in the middle of the last century, was born here. A treaty of peace between the empire and France was negotiated at Lunéville in 1801.

The arrondissement of Lunéville has an area of 466 square miles, and comprehends five cantons and 143 communes. The population in 1831 was 82,661; in 1836 it was 84,092.

LUNGS. [RESPIRATION.]

LUNGS, DISEASES OF THE. The highly organized structure of the lungs and the incessant exercise of their important function, frequently under noxious circumstances, render these organs perhaps the most liable to disease of any in the body. Exposure to damp and cold, sudden atmospherical changes and transitions of temperature, want of proper nourishment, inattention to personal cleanliness, and some of the mechanical employments in which the confined and heated atmosphere of workshops is impregnated with minute particles of foreign substances, such as steel, wool, &c., may be considered as amongst the chief exciting causes of this extensively prevailing class of diseases. The subject may be conveniently divided into those affections which are acute and rapid in their progress, and those in which their course is slower and the changes of structure more gradually effected.

In *inflammation of the lungs* (pneumonia; peripneumonia) the air-cells and parenchymatous structure of the organ are the seat of the disease. This affection is generally preceded in a greater or less degree by shivering and other febrile symptoms as commonly usher in any febrile attack. Soon afterwards pain and a sense of oppression are felt in the chest, with hurried respiration and a short dry cough. The pain is sometimes severe, sometimes it is described as of a dull and obscure kind and deeply seated. If the pleura, or investing membrane of the lungs, participates in the affection it is generally severe. At first there is little expectoration, but this increases in the progress of the disease, and the sputa acquire a reddish or rusty colour from the admixture of small quantities of blood. They also possess an unusual viscidity and tenacity, sometimes to such a degree that the vessel into which they are received may be inverted without their falling out; they also contain sometimes minute bubbles of air, which are prevented from escaping by the tenaciousness of the secretion.

If the disease continue unchecked, the difficulty of breathing becomes much greater, and the respirations, which in the natural state are about 20 in a minute, increase in frequency to about 40 or 60. Sometimes there is little cough throughout the disease, but most commonly it increases as the disease advances, and the sputa become more deeply tinged with blood. The features subsequently assume a livid appearance; the breathing gets more oppressed, expectoration is effected with difficulty, the powers of life fail, and the patient dies from the lungs being no longer able to carry on their function.

When a favourable change takes place in the course of the disease, either spontaneously or from judicious medical treatment, it is generally attended by perspiration, the expectoration loses its rusty colour and unusual tenacity, the urine becomes turbid, and sometimes there is diarrhœa. Andral and other authors are of opinion that improvement is most likely to take place at certain times—critical days. The diagnosis of this disease has received most important assistance from auscultation, and in many instances it has been detected by its aid, where formerly it would have been overlooked. The assistance afforded by the auscultatory signs will perhaps be better understood if we defer them until we have spoken of the changes of structure in the lungs occasioned by inflammation.

In the early stage of pneumonia the inflamed part acquires an unnatural density and heaviness from the unusual accumulation of blood in it, and if a portion of lung so circumstanced be examined after death, pressure with the finger on its surface leaves an indentation which is not filled up, as would immediately be the case in a healthy state of the part. When it is cut into, a bloody frothy fluid exudes freely from it, and the surfaces present a deep blood-red colour, and if a portion be squeezed between the finger and thumb a crackling noise is heard indicating the presence of air. In a more advanced state, the lung is found still more dense, and does not crepitate when squeezed, showing that air is no longer admitted. As in this condition it somewhat resembles liver, it has been termed the stage of hepatization. When the disease has proceeded still farther, suppuration may be found to have taken place. Pus is then observed to be effused throughout the structure of the diseased part, by which the dull red is changed to a yellow or straw colour, and the mass is rendered soft and easily broken. Suppuration in the form of abscess very rarely occurs as a consequence of pneumonia. Laennec is of opinion that death most probably takes place before the change can have proceeded to that extent.

Auscultatory Signs.—In that stage of the disease in which there is only an accumulation of blood in the part, and whilst air is still admitted, the respiratory murmur is heard on examining the chest with the ear or stethoscope, but it is attended with a crackling sound which resembles that produced by rubbing a portion of hair between the finger and thumb near the ear, or by throwing salt into the fire; this is commonly called crepitous rattle, or crepitous respiration. A clear sound is also heard on percussing the chest.

If the disease has proceeded to the stage of hepatization, the lung being in that part solid and impervious to air, percussion will afford only a dull sound without resonance, and the murmur attendant on respiration will be altogether wanting. Should a large bronchial tube pass near the hepatized portion, the resonance of the voice in the bronchus will be heard more distinctly than usual, on account of the solid being a better conductor of sound than the healthy lung.

When suppuration has taken place, the sound on percussion is also dull, and the natural respiratory murmur is wanting, but in its stead a loud gurgling noise is heard, resembling that produced by air passing through soap-suds. It is perhaps occasioned by pus escaping into the larger air-tubes.

Treatment.—The treatment of inflammation of the lungs must be conducted on the same general principles as inflammation occurring in any other part. The important nature of the organ renders it necessary to resort promptly to bleeding, sometimes to a very large amount, and on repeated occasions. Antimonials and mercury are also highly useful in this affection.

Inflammation is sometimes confined to the bronchial tubes, and is called bronchitis; it may also co-exist with pneumonia. [BRONCHITIS.]

Mortification or gangrene of the lungs, though sometimes occurring as a result of pneumonia, most frequently takes place as an independent affection. Great fetor of the breath, with an expectoration of dark-brown, greenish, ash fetid sputa, excessive debility, and a cadaverous expression of countenance, are the symptoms by which it is indicated. After death portions of lung are found in a partially decomposed state, of a dark brown or dirty greenish appearance, with a putrid smell. Occasionally, under favourable circumstances, the mortified parts have been separated and removed by expectoration, and the patients restored to health; but this is not a result which can commonly be looked for. It has been known to occur sometimes as a consequence of working in cesspools, and of long exposure to the noxious effluvia attendant upon such occupations.

Hæmoptysis; Spitting of Blood.—Expectoration of blood may occur either by exhalation from the mucous membrane of the air-tubes or from the lesion of a blood-vessel. It generally occurs in early life, from the age of fifteen to thirty-five, and in the former instance may be dependent upon local congestion. This determination of blood to the lungs may be occasioned by the sudden suppression of some natural or accidental discharge from other parts, as in suppressed or impaired menstruation, or the arrest of an hæmorrhoidal discharge. Malformation of the chest also, by interfering with the free circulation through the lungs, or an impeded transmission of blood through the abdominal viscera, from the presence of tumours or ascites, may likewise contribute to produce it. Sometimes it appears to be dependent upon an altered condition of the blood itself, as in purpura and some eruptive fevers; but its most frequent cause is tubercular disease of the lungs, in which it may arise in an early stage from the obstruction to the circulation occasioned by the tubercles, or subsequently from the vessels participating in the ulcerative destruction.

A remarkable sympathy has been observed to exist between the uterus and the organs of respiration, and spitting of blood has sometimes been known to precede the appearance of the menses, and to cease entirely on their accession. Sometimes it has been found to supersede the discharge altogether, or to make up for a deficiency in its quantity.

An attack of hæmoptysis is usually preceded by certain premonitory symptoms, such as chilliness, headache, lassitude, and a quick and vibrating pulse. The patient also experiences a sensation of weight and constriction at the chest, with a feeling of heat and itching in it. The expectoration of blood is attended with cough. Sometimes the quantity brought up is very considerable, and is expelled with violence; at other times the sputa are only streaked with it. The expectorated blood is generally of a vermilion colour, and, when in small quantities, it is frothy and mixed with air. When the blood comes from the stomach, it is brought up by vomiting and without cough, without the frothy appearance, and is of a dark grumous character.

Pulmonary Apoplexy.—When it happens that the blood, instead of being exhaled into the air-tubes, is effused into the parenchymatous structure of the lungs, the name of pulmonary apoplexy is given to it. One or two lobules, or a small portion of the lungs only, may be affected in this manner, the structure of the part not being broken down by it. When this is the case, hæmoptysis may not take place. Such effusions are found after death in the form of circumscribed indurated masses of a dark brown colour nearly approaching to black, and surrounded by the lung in a perfectly healthy state. Life not being immediately destroyed in such cases, time is given for the absorption of the most fluid parts of the blood, which will account for the indurated character of these deposits. When the effusion is more extensive, large portions of the substance of the lung may be torn and broken down, and hæmoptysis to a very considerable and generally immediately fatal extent takes place.

One of the most common causes of pulmonary apoplexy is disease of the heart, by which the circulation through the lungs is impeded and oppressed with blood. The causes mentioned as conducing to hæmoptysis are also common to this affection, and the symptoms are very similar. The plan of treatment in these affections is founded on the same general principles as are applicable in any case of internal hæmorrhage. [HÆMORRHAGE.]

Phthisis Pulmonalis.—This is by far the most frequent and most fatal of all diseases of the chest. It is the consequence of the deposition of small granular bodies of a greyish-white colour, called tubercles, in the structure of the lungs. By coalescing these smaller bodies acquire sometimes the size of a bean, or even of a filbert, assume a light yellow colour, and become something like cheese in consistence. They may exist in a quiet state for a long time without materially affecting the health, but subsequently they become more active, soften, and give rise to abscesses (vomica), which increase and produce death either by suffocation or by wearing out the powers of the constitution. For a more extended account see article PHTHISIS PULMONALIS.

Malignant Diseases.—The lungs are also subject to diseases of a specifically malignant nature, such as medullary sarcoma and melanosis; but these rarely occur as a primary affection. The medullary and melanoid matter is deposited in these organs as a secondary affection, in conjunction with its existence in other parts, and frequently in all or the majority of the organs of the body.

Black or Carbonaceous Matter in the Lungs.—Of late years medical men have observed a peculiar discoloration in the lungs of persons who have died after working for a long period of time in coal-mines, or in mines where gunpowder is used in large quantities for blasting masses of rock. The lung is found of a coal-black colour throughout, though still perfectly natural in all its other characters. It also exists in connection with disease of the lung, and the expectoration of persons so affected partakes of the same colour. The cause of it seems to be doubtful; but most probably it arises from the inhalation and absorption of the carbonaceous matter existing in the atmosphere of such mines.

Bony and cartilaginous tumours have been found in the lungs, and the membrane surrounding the lungs (the pleura) is sometimes met with converted into bone; sometimes it is studded with tubercles similar to those found in the lungs of Phthisis. For an account of inflammation of the pleura see PLEURISY.

LUNU'LITES. [CELLARIÆA, vol. vi., p. 400.]

LUPA. (Crustaceology.) [PORTUNIDÆ.]

LUPINITE, a peculiar bitter substance, extracted from the leaves of the *Lupinus albus* by treating the meal w anhydrous alcohol: the solution being evaporated to dryness, the lupinite remains; it has a green colour, is translucent, and may be melted; it is soluble in æther as well as in alcohol; but it is probably mixed with other vegetable products.

LUPI'NUS, a very extensive genus of hardy annual, perennial, and half-shrubby plants, commonly cultivated gardens for the sake of their gaily-coloured flowers. The species inhabit Europe, the basin of the Mediterranean and the temperate parts of both North and South America especially of the former, where they are extremely abundant but they are unknown in a wild state throughout all tropics, except on mountains, and in the principal part of A New Holland, and South Africa. Figures of great number have appeared in the volumes of the 'Botanical Register and Magazine,' and there is a monograph of the genus published at Lund by the younger Agardh in 1835, under the name of 'Synopsis generis Lupini.'

Lupines have been used as green manure, that is, a crop to be ploughed into land when green, but they are esteemed for this purpose. They are also still cultivated in the times of the Romans, by the Neapolitans and southern nations, who eat the seeds after steeping them water to diminish their bitterness, which always render them unpleasant to those who are unaccustomed to u The Greeks, who called them thermos, employed lu not only as an article of food, but medicinally, esteem them vermifugal and emmenagogue, &c. (Dioscor., ii. c. 132.) What species was cultivated by them is unknown their wild thermos is supposed by Sibthorp to be the *angustifolius*. The two species most common in Gr now are *L. hirsutus* and *pilosus*, but the species cultivated in the south of Europe are *L. albus* and *L. thermis*.

Lupines are said to derive their name from *lupus*, a w because of their devouring the substance of the land which they are grown.

LUPO'NIA. [CYPRÆIDÆ, vol. viii., p. 256.]

LUPULIN, a name given to a substance extracted fr hops, and which was at first supposed to be their pec principle; but it has been since found that it contains from about 8 to 12 per cent. of the vegetable matter to w hops owe their power, and to this the name of *lupulin* been given.

LUPULITE is prepared by a tedious process nearly colourless, but sometimes of orange-colour:

former case it is opaque, but in the latter transparent; it has no smell till it is heated, and then it has the odour of hops; its taste is bitter: water, even when boiling, dissolves only $\frac{1}{20}$th of its weight; the solution is pale yellow, and is not either acid or alkaline; neither dilute acids, alkalis, nor solutions of metallic salts produce any effect upon it; alcohol dissolves lupulite readily, but in æther it is almost insoluble.

LUPUS (the Wolf), one of the old constellations, named in Aratus and Ptolemy simply Θήριον, 'the wild beast.' It was not a separate constellation, but was carried in the right hand of the Centaur towards the Altar. The same description is given by Hyginus. In modern maps it is represented as a wolf transfixed by the spear of the Centaur. It is situated between Centaurus and Ara, directly under Scorpius.

LURE. [SAÔNE, HAUTE.]

LU'RIDÆ, a name given by Linnæus to one of his natural orders of plants. It is equivalent to Solanaceæ of modern botanists.

LUSATIA. [LAUSITZ.]

LUSIGNAN. [CYPRUS.]

LUSITA'NIA. [PORTUGAL.]

LUSTRUM was the name applied to a period of five solar years among the Romans; and the termination of this period was generally marked by great religious solemnities. A purifying sacrifice, called *suovetaurilia*, was usually offered at this time by one of the censors in the Campus Martius (Liv., i. 44); and the victims consisted of a cow, a sheep, and a bull, which were led round the people three times, and then slain; but this sacrifice was sometimes omitted on religious grounds (Liv., iii. 22). Varro (*De Ling. Lat.*, v. 2) derives the word from *luere*, because the farmers paid their taxes at that time; but others, with more probability, trace the etymology to the purifying sacrifice which was then offered.

It is well known that the most antient Roman year consisted only of 10 months, or 304 days, and that this year continued to be used for religious purposes. Niebuhr, in his 'History of Rome,' has shown that the *lustrum* was the period, after which the beginnings of the civil and religious years were made to coincide; since 5 solar or civil years of 365 days each, containing 1825 days, coincide with 6 religious years of 304 days each, containing 1824 days, with the difference of one day.

In the time of Domitian the name of *lustrum* was given to the public games which were exhibited every fifth year in honour of the Capitoline Jupiter. (Sueton., *Domitian*, c. 4.) The poets frequently used the word for any space of five years (Hor., *Od.* ii. 4, 24; iv. 1-6), and sometimes confounded it with the Greek olympiad, which was only a space of four years. (Ovid, *Pont.*, iv. 6-5; Martial, iv. 45.)

(Niebuhr's *History of Rome*, vol. i., pp. 270-280, Eng. transl.; Creuzer's *Abriss der Römischen Antiquitäten*, p. 146: and the article CENSOR in this work.)

LUTE, a musical stringed instrument with frets, one of the numerous varieties of the antient cithara. Till towards the end of the seventeenth century its practice formed an essential part of a good education, but it has since been partially superseded by the guitar: nevertheless the salaried office of *Lutenist* is still continued in the Chapel Royal, though the place is a sinecure. The derivation of the word seems to have perplexed many who have sought its etymology: it is, we have no doubt, to be traced to the Teutonic *Lut*, whence, modified, it has passed into all the European languages, whether cognate or otherwise.

We do not meet with any notice of this instrument, so named, before the time of Dante, who, ludicrously enough, compares the swelled figure of a person suffering under dropsy to the form of the lute. The shape of the body and principal or lower neck may be seen in our wood-engraving of the ARCH-LUTE. Mersenne, in his *Harmonie Universelle* (1636), describes the lute as consisting of three parts: the table, made of fir; the body or belly, of the same wood or cedar, constructed of nine convex ribs joined; and the neck, on which was fixed the finger-board, of hard wood, having nine frets made of catgut. To these is to be added the head or cross, in which the pegs or screws were placed. Thomas Mace, a celebrated teacher of the lute, in a curious work entitled *Musick's Monument* (1676), agrees in the description given by the learned French monk, adding a great number of other particulars relative to the construction and use of the instrument; to whose very remarkable folio we refer those who are desirous of minute information on the subject. We shall here only state, from the same writer, that the lute had at first six strings, or rather eleven, for the five largest were doubled; but that the number was gradually increased till it reached twenty-four. He tells us that in his time a very choice instrument fetched the sum of 100*l.*, which may be considered as equal to 400*l.* of our present money. [ARCH-LUTE; GUITAR.]

The notation for the lute, theorbo, &c., called the *tablature*, differed entirely from that of other instruments. 'The chords,' says Sir J. Hawkins, 'are represented by a corresponding number of lines, and on these are marked the letters *a*, *b*, *c*, &c., which letters refer to the frets on the neck of the instrument. The time of the notes is signified by marks over the letters of a hooked form, that answer to the minim, crotchet, &c. This is the French tablature; but the Italians, and also the Spaniards, till of late years, made use of figures instead of letters.' There were many kinds of tablature, but being now obsolete and forgotten, it is unnecessary to add anything further concerning them.

LUTES, in chemistry, are substances employed in various operations for closing the joints of apparatus, and especially for connecting retorts and receivers so as to prevent the escape either of the vapour or gases generated during distillation or sublimation. The term lute is also applied to the external coating of clay and sand, or other substances applied to glass retorts, in order that they may support a high temperature without fusing or cracking. For operations on the large scale, as the distillation of aquafortis and muriatic acid, &c., common plastic clay is a sufficiently good lute. Sometimes it has been recommended to use what is termed *fat lute*, but this generally only in small distillations, as of nitric acid: this lute is prepared by mixing dried and powdered pipe-clay into a paste with linseed oil; and the joint is further secured, both where this lute is used and in many other cases, by tying it over with moistened bladder.

In most operations however a mixture of pipe-clay and meal, as linseed meal or almond powder, is quite sufficient, when secured by bladder, for any purposes, either when acids or ammonia are to be distilled. In luting common stills, in which oils or water are merely distilled, linseed meal and water, made into a paste, form an effectual lute.

In luting, or rather coating glass retorts, in order to enable them to sustain high temperatures, Stourbridge clay or Windsor loam mixed with tow have been used; but they require long drying, and are apt to crack. The simplest mode is that of brushing the retort over with a paste of pipe-clay and water, sifting sand upon it, drying it quickly in the ash-pit of the sand-heat; then covering it again with clay and sand, and repeating the alternate applications and drying till the coating is judged sufficiently thick.

LUTHER, LUDER, or LOTHER, MARTIN, born at Eisleben in Saxony, in November, 1483, was the son of Hans Luther, a miner and a worker in metals, who was a native of Eisenach. Young Martin was first sent to the school of Eisenach, where he spent four years, and in 1501 he went to the university of Erfurt. His father intended him to study the law, for which however he felt little inclination, but he applied himself to literature and music, which latter he continued to cultivate during the rest of his life. While at Erfurt he appears to have exhibited the usual jovial careless disposition of a German student. In 1505 an accident occurred which altered the current of his thoughts. One of his fellow-students was killed at his side by lightning, and Luther from that moment made a vow to become a monk. On the 17th of July in the same year he entered the Augustine convent at Erfurt, carrying with him only a Virgil and a Plautus. His father was at first averse from this resolution; but after two years he consented, and was present at the ordination of his son in 1507. In the retirement of his convent Luther was tormented by temptations and religious scruples and doubts, which he has pathetically described, especially on the subjects of faith and salvation, until he at last adopted the principles of St. Augustin, or at least those ascribed to that Father, on grace and predestination. The provincial of his order, Staupitz, a man well-informed, honest, and kind-hearted, administered to him spiritual consolation, and appreciated his talents; and it was through his influence that, in 1508, Luther was appointed professor of philosophy in the university of Wittenberg. In his lectures, which were well attended, he appears to have discarded the scholastic forms which were prevalent at the time, and to have appealed to reason more than to authority. In 1510 he was sent by his superiors to Italy on business concerning the order, a circumstance which brought about a crisis in Luther's life. He proceeded to that country, which he looked upon as the centre of Christendom, with his heart full of spiritual hopes and devout expectations; but he was sorely disappointed and shocked at what he there saw. He found pomp and pride, gross sensuality, hypocrisy, and treachery, as he tells us, even in the convents which were his halting-places on the road. He told the monks at Milan that they ought to fast on Fridays, and he was nearly killed for his pains. His health became affected by these occurrences; he fell ill at Bologna, and was confined to his bed for some time. Having recovered, he continued his journey to Rome, and on his arrival repaired to the convent of his order near the gate Del Popolo. There he knelt on the ground, 'bathed with the blood of martyrs;' he hurried to the various sanctuaries with which the capital of the Christian world abounds; but on looking to those around him, the inmates of the Holy City, he found, to his surprise and grief, what many a young enthusiast has experienced before and since on entering the world, that names and realities, professions and practice, are quite different things. Luther was in fact single in his faith and his religious fervour. Rome at that time, after having passed through the scandalous pontificate of Borgia, was ruled by the choleric and warlike Julius II., who represented the church militant upon earth, and who was then busy about his schemes of humbling Venice and driving the French out of Italy. His cardinals were able diplomatists, men of the world, and learned Latinists, better acquainted with Cicero than with the Bible. In visiting the churches, Luther was shocked at the indecent hurry with which the priests went through the service of the mass, and at the blasphemous jests which he sometimes heard. Even the ministers of the altars made no secret of their unbelief. Luther remained only a fortnight at Rome: he hurried back to his native Germany with his head bewildered, his feelings distressed, and his religious belief greatly shaken. He used to say however, in after-years, that he would not, for one hundred thousand florins, have missed that journey to Rome, for without it he should have been tormented by the fear of being unjust towards the pope during his subsequent controversy with the papal power.

---

* Mr. Baily makes this star to be δ of Bayer, and the next λ.

In 1512 Luther was made doctor of divinity, and Frederic, elector of Saxony, called the Wise, defrayed the expense of his inauguration, which was celebrated with splendour. The reputation of Luther had spread as that of a learned divine and an eloquent preacher. He was well acquainted with scholastic learning, and tolerably so with the Fathers; he knew Greek, but very little Hebrew he had, above all, deeply studied the Scriptures, which was not a common attainment among ecclesiastics in those days. He was zealous and earnest, devotional in his thoughts, and irreproachable in his morals. In his own order he was appointed provincial vicar of Misnia and Thuringia, in which office he evinced much zeal for the maintenance of [illegible] and piety in the various monastic houses of that

In 1517 Pope Leo authorized by a bull the sale of indulgences in Saxony and other parts of Germany, as his predecessor Julius II. had done in France, Poland, and other parts, nominally for defraying the expenses of building the new church of St. Peter's, and also for supporting the league of the Christian powers against the Turks, though little of the money derived from the sale was employed for either purpose. [LEO X.] The practice of selling indulgences had existed for some centuries before Luther. For the original doctrine and practice of the Church on this matter see INDULGENCE. Leo addressed the papal commission for the sale in Saxony to Albert, elector of Mainz and archbishop of Magdeburg, who appointed Tetzel, a Dominican monk, his quæstor, to preach and sell the indulgences through the country. Tetzel appears to have executed his mission with the grossest quackery, enhancing his wares in the opinion of his uninformed and credulous customers by the most absurd exaggerations, and going far beyond the received doctrine of the Roman canonists even of that age. He pretended that his indulgences released not only from penance, but from sin altogether, and from any sin of whatever enormity. Luther, who was then professor of theology at Wittenberg, was shocked at these impious assertions, and while sitting at his confessional in the church of his convent he had practical proof of their mischievous effects. Some of his penitents, who had purchased the indulgences, refused to submit to the penance or reparation which he enjoined, saying that Tetzel had released them from every penalty. Luther having refused absolution, they went and complained to Tetzel, who threatened with both spiritual and temporal punishments all those who denied the efficacy of his indulgences. Luther, little heeding the threats of the Dominican, and being encouraged in his opposition by his own superior Staupitz, who also felt indignant at Tetzel's impudence, drew up ninety-five theses or propositions concerning indulgences, in which, drawing the distinction between the canonical penalties inflicted by the Church on the penitent sinner, and the penalties required here or hereafter by Divine justice, he maintained that the pope had the power of remitting the former only; that indulgences could not be applicable to the dead; that true contrition of heart and amendment of life would obtain pardon without any papal indulgences; that the true treasures of the Church were contained in the Gospel and in the operation of the Holy Ghost; that at all events, if indulgences be of any avail, they ought to be distributed gratis to the poor, and not to be made an article of trade: and here he exposed in strong colours the avarice, impudence, and licentiousness of the quæstors, and the fearful corruption of principles and conduct among the poor deluded population resulting from the whole system.

Luther enclosed a copy of his propositions in a letter to the archbishop of Magdeburg, dated 31st October, 1517, beseeching that prelate to interpose to prevent the further spreading of error, and to put a stop to Tetzel's scandalous practices. On the same day Luther affixed another copy of his theses on the gates of the Castle church of Wittenberg, signed with his name, and containing his offer to defend them. This was Luther's first challenge to that power which then kept all Europe in awe, and which he was destined to shake to its very foundations. Though in these celebrated theses there was nothing but what has been maintained by many Roman Catholics, still some of them were certainly at variance with the opinions generally entertained for three centuries before Luther's time, and also with the claim of infallibility assumed by the popes. From the pulpit of the same church Luther repeatedly expounded his propositions, and was eagerly listened to by crowded audiences. His theses spread with the greatest rapidity, and the main principle upon which they rested, namely, that indulgences could only remit the canonical or temporal penalty, gained ground universally throughout Germany. Tetzel and his brother Dominicans, after burning Luther's theses, attempted to answer them by counter-propositions mainly grounded upon the supreme authority of the pope and his infallibility. But this production injured Tetzel's cause, and a copy of it was publicly burnt by the Wittenberg students. Leo X., when he heard of the dispute, remarked, that it was but a quarrel between monks, and that brother Luther seemed to be a man of parts. The idle assertion which has been put forth by later writers, that Luther and his superior Staupitz were actuated by jealousy against the Dominicans for having the monopoly of the indulgences, has been triumphantly refuted.

by Dr. Maclaine in a note to Mosheim's 'Ecclesiastical History,' and the insinuation was never broached during Luther's lifetime by his most inveterate enemies. In fact the traffic in indulgences had fallen into contempt among the clergy, and the Franciscan friars themselves refused to have anything to do with it.

In the year 1518 Eckius, a professor of divinity at Ingolstadt, took up the controversy against Luther, who answered him, and thus increased his popularity and the number of his adherents, whilst at the same time the warmth of debate carried him beyond his original propositions and led him to touch on the abstruse subjects of free-will and the means of justification. Still it appears that Luther had as yet no intention of separating from the Roman Catholic Church. In May, 1518, he addressed a submissive letter to Leo X., in which he says, 'I throw myself prostrate at your feet, most holy father; call or recall me, approve or condemn me as you please; I shall acknowledge your voice as the voice of Christ, who presides and speaks in your person.' Leo summoned Luther to appear at Rome in sixty days, and there to plead his own cause; but the elector of Saxony interposed, and obtained permission for Luther to be examined within the bounds of the empire, and to be judged by its ecclesiastical laws. Cardinal Caietano, of the order of Dominicans, and papal legate at the diet of Augsburg, was ordered to examine him. Luther, accompanied by Staupitz and another friend, repaired to Augsburg, in October, 1518, and was received by the cardinal with courtesy; but instead of arguing the point with him, the cardinal assumed an imperious tone, and commanded him to retract because the pope so willed it, and how could he, Luther, a single monk, expect to be able to cope with the pope? (Luther's *Letter* to Spalatin, chaplain to the elector, and his friend, dated Augsburg, 14th October.) Luther replied that neither the legate nor the pope could pretend to infallibility, and that St. Peter himself had erred. In one of these interviews however the cardinal was insensibly drawn out from his high ground, and entered the field of controversy, but it would appear with little success. He rejected with scorn what he considered the novel doctrine of justification by faith and by faith alone. In the end, Luther, thinking perhaps of the fate of John Huss, suddenly quitted Augsburg, leaving behind an appeal to the pope 'better informed.' In November of the same year Leo issued a bull, declaratory of the doctrine of indulgences, asserting that the pope, as Christ's Vicar on earth, had the power of delivering from all the punishments due to sin those who had repented and were in a state of grace, whether they be alive or dead. On the 28th November Luther appealed from the pope to a general council of the church.

Meantime the cardinal legate was urging the elector of Saxony to expel Luther from his dominions. But the elector, who considered Luther as the pride and ornament of his newly founded university of Wittenberg, would not consent, and the emperor Maximilian I. having died just at this moment, Frederic, as hereditary vicar of the empire during the vacancy, was a person too important for even Rome to dictate to. Leo commissioned a new legate, a Saxon, named Miltitz, a man of sagacity and prudence, to endeavour to bring Luther to a reconciliation. Miltitz had a conference with Luther at Altenburg, in the beginning of 1519, in which he agreed with Luther in condemning the abuse made by Tetzel of the indulgences, threw the whole blame of it on that monk's ignorance and profaneness, and so far conciliated the warm but generous spirit of his antagonist as to induce him to write a submissive letter to Leo, dated 13th March, 1519, in which Luther acknowledged that he had carried his zeal and animosity too far, and promised to observe in future a profound silence upon the matter in debate, provided his adversaries would observe an equal temperance; further protesting that he never meant to deny the power of the pope, which was inferior only to that of Christ, and that he would always exhort the people to honour the Roman see, which he had in his writings endeavoured to clear from the impious exaggeration of the quæstors. 'This letter,' says Beausobre, 'is a sad monument of human weakness,' for Luther had already appealed from the pope to the council. Luther's vacillation however may be easily accounted for by reference to the old established reverence for the papal see, the reminiscence of his own early impressions and education, and of his solemn monastic vows, and also to the cordiality and convivial familiarity of his intercourse with Miltitz. It appears that Leo himself wrote to Luther a very mild and conciliatory epistle, published by Loscher in his *Unschuld Nachricht*, 1742. Miltitz had other conferences with Luther at Leibenwerd and Lichtenberg, which gave great hopes of a full reconciliation, when the polemic intemperance of Luther's personal adversaries widened the rupture and brought the dispute to a crisis. (Seckendorf, *Commentarius Histor. de Lutheranismo.*)

Eckius challenged Carlostadt, one of Luther's disciples, to a public disputation at Leipzig, concerning free-will. Carlostadt maintained that since the fall of our first parents our natural liberty is not strong enough to lead us in the path of good without the intervention of Divine grace. Eckius asserted that our natural liberty co-operates with divine grace, and that it is in the power of man to consent to the divine impulse or resist it. Eckius seemed to have the best of the argument on his side, when Luther, who had repaired to Leipzig, entered the lists against Eckius, by preaching in the chapel of Duke George's castle a sermon calculated to draw the hostility of Eckius against himself. Eckius, in fact, immediately selected from Luther's works thirteen propositions, which he met by as many counter-propositions. One was concerning the supremacy of the Roman see. Eckius maintained that the church was a monarchy with a head of divine appointment. Luther admitted this, but contended that the head was no other than Jesus Christ. The long acknowledged supremacy of the pope, he observed, extended only to the Western church, and he maintained that it was not *jure divino*, but founded on reasons of policy and tacit consent. Then came the subjects of purgatory and of indulgences, in which Luther had decidedly the advantage, and partly drew his antagonist to his side. Next were discussed the questions of absolution, grace, free-will, and good works, in which the Catholic divine appeared to prevail in point of argument. Hoffman, the rector of the university of Leipzig, who had been appointed judge of the disputation, refused to declare to whom the victory belonged, and the decision of the matter was referred to the universities of Paris and of Erfurt. Luther however went on publishing several works, 'On Babylonian Captivity,' 'On Christian Liberty,' &c., in which he openly attacked the doctrines and the authority of the church of Rome. Leo now assembled a congregation of cardinals, before whom the works of Luther were laid, and by whose advice a bull of condemnation was drawn up against Luther, and published on the 15th of June, 1520, in which forty-one propositions, extracted from his writings, were declared heretical, and as such solemnly condemned; his writings were ordered to be publicly burnt; and Luther himself was summoned to confess and retract within the space of sixty days, under pain of excommunication. Luther having again appealed to the general council of the church, publicly separated himself from the communion of Rome, by burning on a pile of wood, without the walls of Wittenberg, in presence of a vast multitude of people, Leo's bull, and also the decretals and canons relating to the pope's supreme jurisdiction. This was done on the 10th of December, 1520, and on the 6th of the following January the pope launched a second bull against him, by which Luther was expelled from the communion of the church for having disowned the supremacy of the Roman Pontiff.

Luther having now irrevocably separated from Rome, gave way to the violence of his temper in several vehement and scurrilous pamphlets, full of coarse vituperation against the pope, whom he openly styled Antichrist.

At the same time Leo urged the new emperor Charles V., in his character of advocate and defender of the church, to make an exemplary punishment of Luther as an obdurate heretic. But Frederic, the elector of Saxony, employed his influence with Charles to have Luther's cause tried by a diet of the empire, which assembled at Worms, in April, 1521.

Having obtained the emperor's safe conduct, he repaired to Worms, and was met by multitudes outside of the town. On entering he began singing the hymn 'Our God is a strong citadel,' which became known as Luther's hymn, and the inspiring song of the Reformation. On the 17th of April he appeared before the emperor, the electors, bishops, dukes, margraves, and other princes and lords assembled, and being asked whether he was the author of the books now produced, in which the propositions condemned by the pope were contained, he answered in the affirmative. Being next asked whether he would retract or maintain them, he begged for time to consider of his answer, and was allowed one day. The following day he appeared again before the assembly, and said that his writings were of various character, that in some he had treated only of Christian faith and piety, and these could contain nothing objectionable; that in some he had exposed the inventions of men and the usurpations of the popes, and these he could not retract; that in others, which were directed against the defenders of the pope, he might have expressed himself in an unbecoming manner, but that he could not retract the substance however censurable the manner of it; that, being a man, he was liable to error, and that he was ready, if convicted by the testimony of the Scriptures, to commit a portion or the whole of his publications to the flames. And he repeated what he had already said on another occasion, that both pope and council were liable to error, and had in fact often erred. He had formerly quoted the council of Constance as an instance of his assertion.

On the following day Charles V. told the diet, that attached as he was to the Roman Catholic church, he should ever defend its doctrines and constitution, that he could hear Luther no more, and that he should dismiss him, and afterwards treat him as a heretic. This decision was also that of the majority. Some were for trying persuasion and entreaty with a man who, like Luther, could not be frightened into submission; but entreaty was likewise of no avail, for Luther refused to retract a single proposition unless proved to be erroneous by the authority of the Scripture. He was then ordered to leave Worms, with a written promise of security for twenty-one days. He left on the 26th of April, but on entering a forest his carriage was stopped by a party of armed horsemen in masks, who placed him on horseback and rode off with him to the solitary castle of Wartburg, situated on a mountain. This was another contrivance of his kind protector the elector of Saxony. The greatest secrecy was observed concerning the place of his retreat, and it was purposely reported about that his enemies had carried him off. A month after his departure an imperial edict appeared, placing Luther under the ban of the empire, ordering him to be seized and retained in prison at the emperor's pleasure, and imprisonment and confiscation were denounced against any one who aided and abetted him. But the edict could not be enforced. The elector of Saxony was Luther's friend; few, if any, of the other electors or princes were his enemies, and the popular voice was for him: for the Germans in general, although few of them understood the subject matter of Luther's polemics, were weary of the abuses and encroachments of the ecclesiastical power.

In his asylum at Wartburg Luther wrote several treatises against auricular confession, against monastic vows, clerical celibacy, and prayers for the dead, against the Sorbonne of Paris, which had condemned his works, and which he exposed to public ridicule. His writings spread and produced a wonderful effect in Saxony. Hundreds of monks quitted their convents, and married. The Austin friars of Wittenberg abolished the mass. Carlostadt, a disciple of Luther, but more intemperate than his master, accompanied by a band of reformers, demolished the images in the church of All Saints at Wittenberg, and next proposed to banish all books from the university except the Bible. He also affected to obey to the letter the sentence pronounced on Adam by going to work in the fields for some hours daily. Even the polished Melancthon followed the example, and went to work in a baker's shop.

Luther, in his retirement, heard of these follies; he perceived that fanaticism was spoiling his cause, and he resolved immediately, without heeding his own danger, to return to Wittenberg (1522). He rebuked Carlostadt, who retorted, calling him an idolater because he believed in the real presence in the sacrament, and a courtier for living on terms of intimacy with princes. At last they parted in anger; Carlostadt was banished from Saxony as a seditious person by the elector, for inculcating the principles of natural equality, and he went to join Zuingli in Switzerland.

Luther was now the acknowledged leader and oracle of the reformers of Germany, and as such he continued to the end of his life. The doctrines which he gradually asserted, and which were expounded and fixed by his disciple Melancthon, in the Confession of Augsburg, are stated in the article **Protestantism**. At the close of 1522 he published his German version of the New Testament. In 1523 he preached against the mass. He had already replied in his usually scurrilous style of polemics to the treatise in defence of the sacraments written by Henry VIII. of England. It must be observed however that the coarse vituperations which shock the reader in Luther's controversial works were not peculiar to him, being commonly used by scholars and divines of the middle ages in their disputations. The invectives of Valla, Filelfo, Poggio, and other distinguished scholars against each other are notorious, and this bad taste continued in practice long after Luther down to the seventeenth century, and traces of it are found in writers of the eighteenth, even in some of the works of the polished and courtly Voltaire.

In 1524 Luther threw off his monastic dress, and definitively condemned monastic institutions. Convents, both of men and women, were now rapidly suppressed throughout North Germany, and their property was seized by the secular power: indeed there can be no doubt that the hope of plunder contributed greatly to the encouragement which the princes and electors gave to the new doctrines. The insurrection of the *wiedertaüfer*, or anabaptists, led by a fanatic named Muntzer, which assumed the character of a peasant war against all property and law, gave great concern to Luther, who was taunted by many with being the source from which all those aberrations flowed. He preached against the fanatics, he tried to mediate, he besought the peasants to lay down their arms, and at the same time he told the princes to redress the grievances of the poor; but the insurgents were too far gone in their brutal career of bloodshed and devastation, and nothing but the sword could put a stop to it. Luther was sorely grieved throughout the rest of his life at the renewed disorders of the anabaptists and other fanatics on one side, and on the other at the selfishness, worldliness, and corruption of all classes. He fancied at times that the end of the world must be nigh, for the world had fallen into decrepitude; avidity and self-interest were the ruling passions. (Luther's *Table Talk;* and his *Letters.*)

In 1525 Luther married Catherine de Bora, a young nun who had left her convent the year before. He had long before condemned the obligation of clerical celibacy, as well as that resulting from monastic vows, as being human devices unknown to the original church. 'Marriage in its purity,' he wrote, 'is a state of simplicity and peace.' When Luther married he was poor, for amidst the great change from the old to the new system of church discipline, his salary, which was charged upon the revenues of monastic property, was by no means regularly paid, and Luther was not a man to ask money of his friends. In the same year his steady and considerate patron Frederic of Saxony died, but John, his successor, not only continued to favour Luther, but made open profession of his doctrines, and commissioned him to prepare a new church service for his dominions, in addition to which Luther wrote a larger and a small catechism for the use of schools, in a style admirably suited to youth. Besides the elector of Saxony, the Elector Palatine, the landgrave of Hesse, the duke of Deux Ponts, the margrave of Brandenburg and grand-master of Prussia, and also many cities in other parts of the empire, openly embraced Luther's reformation. In Switzerland however another reformer, Zuingli, who had begun, like Luther, by opposing indulgences, had also effected a reformation, but he inculcated tenets different in some respects from those of Luther, especially on the subject of the real presence in the sacrament, which Luther admitted, and Zuingli entirely denied. Luther was vexed at this division, especially as several towns of Germany, Strasburg, Ulm, Memmingen, Lindau, Constance, and others, adopted Zuingli's tenets.

In March, 1529, a diet was convoked at Speyer, in which the Catholics endeavoured to enforce the edict of Worms, but the opposition of the elector of Saxony, the landgrave of Hesse, the margrave of Brandenburg, and the deputies of the imperial cities, caused its rejection. The Catholics then endeavoured to separate the reformers; they drew up a decree, apparently directed against those who denied the real presence, but so worded as to include the Lutherans also who refused their sanction to it. It was on this occasion that the reformed princes and deputies delivered a formal 'protestation' against the decree, dated Speyer, 19th of April, 1529, which was signed by John, elector of Saxony, George, margrave of Brandenburg, Philip, landgrave of Hesse, Ernest and Francis, dukes of Lüneburg, Wolfgang, prince of Anhalt, and the deputies of fourteen cities. From this protestation arose the name of 'Protestants,' which in its origin was applied to the Lutherans.

The landgrave of Hesse, wishing if possible to bring about a union among all reformers, succeeded in appointing a conference between Luther and Melancthon on one side and Zuingli and Œcolampadius on the other at Marburg. The conference turned chiefly on the subject of the real presence, but it produced no approximation among the opposite parties. They separated neither in friendliness nor hostility, and both parties retained their favourite tenets.

In 1530 a diet was convoked at Augsburg by Charles V., who attended it in person, and there the Lutherans presented their confession of faith, which was drawn up by Melancthon and approved by Luther. [AUGSBURG, CONFESSION OF.]

In 1534 Luther completed his greatest work, the German version of the Bible, which is much admired for its elegance, force, and precision, and which has rendered the Scriptures really popular in Germany.

The remaining years of Luther's life were passed in comparative quiet, chiefly at Wittenberg, in the duties of his professorship, in writing religious and controversial tracts, and in epistolary correspondence. He was consulted by the Protestant princes and clergy upon all important matters, and listened to with deference. The pacification of Nürnberg in 1532 had left the Lutheran princes, states, and towns in full possession of their religious liberties; and that peace was not openly interrupted till after Luther's death. Luther had the satisfaction of seeing his doctrines spread farther and farther through Germany, thoughout Saxony and Brandenburg, to Moravia and Bohemia, Denmark, and Sweden. He also effected a reconciliation with the so-called Sacramentarians of Strasburg, Ulm, and other towns, by means of Bucer, so that all reformed Germany was united under one banner. The Helvetic reformed churches however continued separate from his.

At the beginning of 1546 Luther repaired from Wittenberg to Eisleben for the purpose of reconciling the counts Mansfeld, whose subject he was born. He attended several conferences for that benevolent purpose, and succeeded in restoring peace to that family. While at Eisleben he preached four times, and also revised a plan of regulations concerning the ecclesiastical discipline of that little state. He had been for some time in a very precarious state of health: on the 17th February he felt very ill and weak, laid himself on a couch, spoke of his approaching death, for which he appeared quite prepared, and recommended his soul to Jesus. He grew worse in the evening. Count Albrecht of Mansfeld and his countess and several medical men attended him during his last hours. His old friend Dr. Jonas having asked him: 'Reverend father, do you die with a firm conviction of the faith you have taught?' Luther in a distinct voice replied 'Yes,' and soon after breathed his last. His body was carried to Wittenberg, where it was buried with great honours. Shortly before his death he wrote several affectionate letters to his wife, who had remained at Wittenberg with her children. He left her by his will a house which he had purchased, as well as a small estate at Zeilsdorf, charging her to pay his debts, which amounted to 450 florins; and he left her also a few valuable trinkets and other moveables, worth about 1000 florins. 'I leave,' he wrote, 'no ready cash or hidden treasure, as I have had no other income but my salary and a few presents, and yet have managed to keep an establishment and purchase property'

Luther's works, which are multifarious and voluminous, partly in Latin and partly in German, have been repeatedly published. The latest edition is that of Erlangen, 26 vols. 12mo., 1826-33. Among his works, those of most interest to the general reader are his 'Table Talk,' *Tischreden*, his familiar letters, and his sermons. Luther ranks high among German writers for the vigour of his style and the development which he imparted to his vernacular language. Schroeck, Melancthon, and others have written biographies of Luther, and Michelet has extracted a kind of autobiography from numerous passages of his works: 'Mémoires de Luther, écrits par lui-même, traduits et mis en ordre,' 2 vols. 8vo., Paris, 1835. From these passages the character of Luther is clearly deduced, for there was no calculation, reserve, or hypocrisy about him. He was frank and vehement, and often intemperate. But he was in earnest in his vehemence; he really felt the importance of the topics he was discussing; and whether he was right or wrong in his peculiar opinions, he was a sincere and zealous believer in the Christian Revelation. Luther considered religion as the most important business of man, and because he considered it as such, he wished to ascend to its very source unalloyed by human authority. He contended for the right of every man to consult the great book of the Christian law; and although he insisted upon his own interpretation of particular passages of the scriptures, the principles of free inquiry which he introduced led to further results, and gradually established that liberty of conscience which now exists in the Protestant states of Europe. But Luther himself, whilst he appealed to the scriptures against human authority, did not for a moment admit of any doubts concerning the truth of revelation. The question between Luther and his antagonists is therefore of material importance chiefly to Christians. To those who do not believe in Christianity it may appear of little consequence what Christians do believe, or how and whence they derive their belief; but even in a social point of view it is of some importance to decide whether large multitudes of men are to exercise their own judgment and be able to give reasons why they believe certain doctrines, or whether they are for ever to repeat, generation after generation, whatever they have been taught in their youth, without exercising their reasoning powers on the matter.

Those who judge of Luther's disposition merely from his controversial style and manner greatly mistake his character. He was a warm-hearted German, kind and generous; he abused and vilified his antagonists the more in proportion as they were powerful, but he could feel for the unhappy, and he even tendered some consolation to his bitterest enemy Tetzel, when, forsaken by his employers, and upbraided as the cause of all the mischief, he was in the agonies of death and despair.

Luther gave that impulse towards spiritual philosophy, that thirst for information, that logical exercise of the mind, which have made the Germans the most generally instructed and the most intellectual people in Europe. Luther was convinced of the necessity of education as auxiliary to religion and morality, and he pleaded unceasingly for the education of the labouring classes, broadly telling princes and rulers how dangerous as well as unjust it was to keep their subjects in ignorance and degradation. He was no courtly flatterer: he spoke in favour of the poor, the humble, and the oppressed, and against the high and mighty, even of his own party, who were guilty of cupidity and oppression. Luther's doctrine was altogether in favour of civil liberty, and in Germany it tended to support constitutional rights against the encroachments of the imperial power.

Luther's moral courage, his undaunted firmness, his strong conviction, and the great revolution which he effected in society, place him in the first rank of historical characters. The form of the monk of Wittenberg emerging from the receding gloom of the middle ages, appears towering above the sovereigns and warriors, statesmen and divines of the sixteenth century, who were his contemporaries, his antagonists, or his disciples.

(J. Alb. Fabricius, *Centifolium Lutheranum*, 2 vols., 1728-30, gives a list of all the authors who had then written concerning Luther and his Reformation.)

LUTON, is a parish in the hundred of Flitt and county of Bedford, comprising the township of Luton and the hamlets of East and West Hyde, Leegrave, and Stopsley. The town, which is situated on the right bank of the Lea, 18 miles south by east from Bedford, and 29 north-west by north from London, is, we believe, neither paved nor lighted, but the inhabitants are well supplied with water from the river. The making of straw-plat and malting constitute the chief manufactures of the place. The living is a vicarage in the patronage of the Marquis of Bute, and valued at 830*l.* per annum. Besides almshouses and a few other benevolent institutions, there is a national-school which is usually attended by a considerable number of children. The population of the entire parish in 1831 was 5693, that of the township alone being 3961. (*Ecclesiastical Revenues Report; Population Returns*, &c.)

LÜTZEN. [GUSTAVUS ADOLPHUS.]

LUXEMBOURG, or LUXEMBURG, a grand-duchy or province in the Netherlands, the sovereignty of which at this time (February, 1839) forms a subject of dispute between Holland and Belgium. The king of the Netherlands became grand-duke of Luxembourg by the arrangements of the Congress of Vienna, and as such a member of the Germanic Confederation. [BELGIUM.] Luxembourg is bounded on the east by the Prussian Rhenish provinces, on the north by Liege, on the west by Namur, and on the south by the French departments of the Moselle and Ardennes. Its greatest length from east to west is 75 miles, and its greatest breadth is 50 miles; its area is 690,000 hectares (equal to 1,700,000 English acres), or 2656 square miles, distributed as follows:—

	Hectares.
Woods and plantations .	211,000
Arable land, pastures and meadows	240,000
Heaths and commons . .	127,000
Uncultivable land, marshes, &c.	88,240
Roads, &c. . .	23,760
	690,000

The principal rivers of Luxembourg are, the Moselle, which for twenty-five miles forms the boundary between this province and Prussia; the Sûre, an affluent of the Moselle, and also a boundary through part of its course between this province and the Prussian territory; the Our and the Elze or Alzette, which fall into the Sûre; the Semois, which rises near Arlon, and, flowing first to the west and then to the north, falls into the Maas; the Ourthe, which rises near Bastogne, and falls into the Maas near Liege; the Lesse, which rises near Neufchâteau, and also falls into the Maas near Dinant. There are also several small streams, which have the appearance of rivers only when swollen by rains.

Luxembourg is crossed from the south-west to the north-east by a range of high ground, part of the Ardennes, which separates the valley of the Maas from that of the Moselle. This range has a mean elevation of 1800 feet above the Maas at Liege, and 1640 feet above the level of the Moselle on the French frontier. The soil of this elevated region is calcareous, which character extends on both sides of the range, and forms a band about 25 miles wide, which is principally occupied as pasturage. The lower lands, which are commonly called the *good country*, are very productive, and yield abundant harvests of wheat and rye, as well as flax, hemp, mangel-wurzel, and all kinds of legumes. Such of the high lands as are applied to arable cultivation rarely yield anything but rye, oats, and potatoes. Luxembourg contains many woods of large growth. The agriculture of this province is said to be inferior to that of any other part of the Netherlands. The vine is cultivated on the banks of the Moselle and the Sûre; and in 1837, the most abundant vintage on record, there were produced 75,503 hectolitres (1,661,066 gallons) of wine. The quality of the wine of the district is inferior. In the same districts are upwards of 2000 distilleries, nearly two-thirds of which have been established since 1832. The quantity of spirit distilled in 1837 was 4,116,420 gallons, from which it is evident that the establishments are generally upon a very small scale.

At the beginning of 1835 there were in the province 32,585 horses, 122,288 horned cattle, and 167,532 sheep; and in the course of that year there were exported 5 horses, 172 horned cattle, and 7536 sheep and lambs, besides 22,217 hogs, of the number of which no account has been taken; they must however be very numerous, as there is scarcely a family in the province by whom swine are not bred and reared. The branches of industry, not agricultural, pursued in Luxembourg, besides distilling, are those of iron-works, slate-quarries, potteries, tanneries, cloth-mills, and paper-mills. The quantity of iron made is about 9000 tons in a year, the ore for which is found in the eastern and western parts of the province. The fuel employed in the smelting-furnaces is wood-charcoal. Luxembourg contains lead and copper. At Stolzembourg, a village about seventeen miles north of the city of Luxembourg, a copper-mine was worked in 1749, 1764, and 1768, and in 1772 was abandoned as being exhausted. There is a lead-mine in work at Longwilly, near Bastogne, but the produce is not great.

Luxembourg is less densely peopled than any province of Belgium. The number of inhabitants, on the 1st of January, 1837, was 323,219, of whom 15,693 only were living in towns, and 307,526 in rural districts. In 1836 there were born in the towns 322 male and 283 female children, and in the country 5678 male and 5469 female children; all together, 11,752. The number of deaths in that year was, in towns 231 males and 194 females, in the country 3588 males and 3408 females; all together, 7421. It appears from an authentic document that the population of Luxembourg in 1541 was only 95,058 souls. In 1784 there were, in the towns of Luxembourg, Arlon, and Echternach, 12,874, and in the rest of the province 211,220 inhabitants; all together, 224,094. In 1817 there were only 213,597 souls, but since that time the increase has been rapid. In [illegible], when the population was 302,654, there were 302,251 Catholics, 68 Protestants, and 335 Jews.

The moral condition of the inhabitants is said to be superior to that of any province in Belgium, a fact which is sometimes attributed to the small number of towns and to the minute division of the land, which is such as to make proprietors of the majority of the labouring people. To these causes may be added the absence of wealth and consequently of temptation to commit offences against property, which form the great majority of charges brought before the tribunals in richer and more densely peopled communities. The province does not contain any considerable libraries nor museums of natural history. Some antient abbeys in former times possessed considerable collections of books, but they have long since been dispersed, and even in the city of Luxembourg there is now no collection that would be considered remarkable if possessed by a private person.

The youths of Luxembourg have no college within the province which they can attend, and are accustomed to go for instruction to Louvain, to Liege, and to Paris. There were in 1833, in all Luxembourg, 779 primary schools, attended by 39,114 scholars of both sexes. The number has increased since that time, and every village or hamlet has now its primary school, the teacher of which is chosen by the heads of families.

The city of Luxembourg, the capital of the province, is a fortress of great strength, in 49° 37′ N. lat. and 6° 9′ E. long., on the Elze: 66 miles south-south-east from Liege, 25 miles south-west from Treves, and 100 miles south-east from Brussels. The city is surrounded by strong walls and deep ditches, and has a double line of outworks in the form of a heptagon. It is small but well built, has four churches, a military hospital, and a newly built market-place; its population is 11,500. Luxembourg as a fortress belongs to the Germanic Confederation, and is occupied by their troops. The town of Arlon is 10 miles north-north-west from Luxembourg. [ARLON.] Echternach, on the right bank of the Sûre, 13 miles north-east from Luxembourg, has a population of 3417, who are occupied with the manufacture of pottery, woollen cloths, and other less important matters. The town is surrounded by a wall, and has five gates; it contains 527 houses, 1 church, 3 chapels, a town-hall, and an hospital. Other towns of the province are St. Hubert, in the Ardennes, formerly the seat of a rich Benedictine abbey, and a place of pilgrimage, with 1500 inhabitants; Bouillon, the capital of the duchy of the same name [BOUILLON]; Neufchâteau, in a wild district of the Ardennes, with 1200 inhabitants; Bastogne, in a plain in the Ardennes, with 2400 inhabitants; Diekirck on the Sûre, with 2500 inhabitants; and Grevenmachern, in a pleasant country on the Moselle, where a considerable quantity of wine is made. [ARDENNES.]

LUXOR. [EGYPT; THEBES.]

LUZE'RN (*Lucerne* in French), a canton of Switzerland, bounded on the north by Aargau, on the east by Schwytz and Zug, on the south by Unterwalden, and on the west by Bern. Its greatest length, from north to south, is 33 miles, and its greatest breadth 27. Its area is reckoned at 657 m[illegible] The declivity of the valleys is towards the north-east and north-west. The southern part of the canton belongs to the basin of the Reuss, which issues out of the Waldstätter lake at the town of Luzern, and flows in a north-east direction into Aargau. Below Luzern the Reuss is joined by the Wald Emme, which rises at the south-west extremity of the canton, runs northward through the fine district called the Entlibuch, and then flows north-east until it meets the Reuss. A succession of high grounds, running across the middle of the canton, divides the basin of the Reuss from that of the Aar, to which latter river the northern part of Luzern belongs. The Suhren flows out of the Sempacher lake, which is in the centre of the canton, and runs northward towards the

Aar. The Wiggern rises in the centre of the canton, south-west of the lake of Sempach, and runs northward into the Aar. North-east of the Sempacher lake is another and smaller lake, called the Baldegger lake, from which a stream runs into the Hallwyler lake, which is in Aargau, but touches the borders of Luzern, and from which a river runs into the Aar. The only mountains in the canton are at its southern extremity, on the borders of Unterwalden and the Bernese Oberland. None of them attain the limits of perpetual snow. The highest is Mount Pilatus, south-west of the town of Luzern, and a conspicuous feature in its landscape. It is a mountain-group nearly thirty miles in length, extending along the borders of Luzern and Unterwalden, and having seven peaks or summits, called Esel, Oberhaupt, Band, Tomlishorn, Gemsmätli, Widderfeld, and Knappstein. The Tomlishorn, 6858 feet, and the Esel, 6678 feet, are the highest summits. The name of Pilatus is said to be derived from the Latin word 'pileatus,' because the mountain-top is often covered with clouds as with a hat. The local legend of the peasantry derives it from Pilate, the governor of Judæa, who is said to have wandered into Helvetia, and to have drowned himself in a lake on that mountain. It is also called Fractmont, 'Mons fractus,' because its sides, especially towards Luzern, look broken, craggy, and inaccessible. The southern side towards Alpnach in Unterwalden is less abrupt, and it is covered with forests which belong to that canton. The most practicable path for ascending the Pilatus is on that side. The view from its summits is very extensive. The soil of Luzern is fertile; it is one of the very few cantons of Switzerland which produces more corn than it consumes, and the excess is purchased by the neighbouring Waldstätten, or pastoral cantons. Fruit trees are also abundant; the vine is cultivated only in some favourable situations. The rearing of cattle is the principal branch of industry in a great part of the canton, especially in the Entlibuch. In some districts of the canton are manufactories of linen and cotton goods. The trade between Switzerland and Italy by the St. Gothard employs a number of people, and all the goods pass through Luzern and the lake of the Waldstätten.

The population of the canton in 1836 was 123,407 inhabitants, of whom only 1585 were natives of other countries. They are exclusively Catholic. German is the language. Under the former system Luzern was a municipal aristocracy, the majority in the legislative council being monopolized by the citizens of the head town. In 1831, the country-people having strongly remonstrated against this arrangement, a new constitution was framed, by which all the citizens of the canton, of the Catholic faith, being above 20 years of age, and having a property of 600 francs and paying taxes thereupon, have a vote in the elections. The great council consists of 100 members, of whom 18 are returned by the town of Luzern, and 62 by the rest of the canton: these 80 deputies appoint the remaining 20, of whom 7 must be from the town of Luzern. The qualifications for a deputy are, 25 years of age and a landed property of 3000 francs. Every two years one third of the council is renewed. The great council appoints 15 of its members to form the little council, or executive, at the head of which is a schultheiss or avoyer, who is renewed annually. The supreme court of justice consists of fifteen members chosen by the great council, one-third of whom are renewed every two years. The canton is divided into twenty-five electoral circles, and into five administrative districts, namely, Luzern, Sursee, Entlibuch, Willisau, and Hochdorf. The public revenue of the canton is 367,642 Swiss livres (the Swiss livre is one franc and a half of France, or about 14 pence sterling), and the expenditure 347,369 livres. The monopoly of salt, which is in the hands of the government, as in most Swiss cantons, brings in 102,000 livres to the revenue; the ohmgeld, or tax on the vineyards, 44,000 livres; the postages 24,000; the tolls 17,000; stamps 10,000; the contributions at which monastic and other ecclesiastical foundations are assessed amount to 25,221 livres. The abbey of Münster, or Beromünster, founded in 850, and the convent of St. Urban, are among the wealthiest in Switzerland. Luzern is in the diocese of the bishop of Basel, who resides at Soleure.

There are in the canton 154 primary or elementary schools, and 16 secondary or grammar schools, a seminary for teachers, a gymnasium, a lyceum, and a polytechnic institute.

LUZERN, the town of, is situated at the western extremity of the lake of the Waldstätten, and is divided into two unequal parts by the Reuss, which issues out of the lake. The larger part, which is on the right bank, is built on the slope of a hill: the whole is surrounded by old walls flanked by towers, and has a fine appearance from the lake, being in the midst of a delightful and well-wooded country interspersed with neat country-houses, with Mount Pilatus rising on one side, and Mount Rigi on the opposite side of the lake. The interior of the town is not so pleasant, the streets being narrow, uneven, and ill paved. The remarkable buildings are: 1, the town-house, with some fine rooms adorned with paintings; 2, the college of the Jesuits, with a fine painting by Torriani; 3, the arsenal, which contains some relics of the battles of Sempach and Morat; and 4, the three covered wooden bridges, which are the chief curiosities of Luzern. They are built on the lake, and serve as a promenade: the Hofbrück is 1380 feet long, and is painted with subjects taken from the Bible; the Kapellbrück is 1000 feet long, and its paintings relate to the history of Switzerland; the Spreuerbrück, which is short, has some paintings of the 'Dance of Death.' The parochial church and cemetery are outside of the town, and are well worth visiting. The topographic map, in relief, of the country round the Waldstätten See, by the late General Pfyffer, who spent more than 10 years of his life in constructing it, is one of the most remarkable things at Luzern. It is 22 feet long and 12 feet wide, and contains the cantons of Uri, Schwytz, Unterwalden, Zug, and part of Luzern. The materials are pasteboard, wax, and resin.

In a secluded spot in the neighbourhood of Luzern is the monument erected in 1821 to the memory of the Swiss guards who died in the defence of the Tuileries against the mob of Paris on the 10th August, 1792. It consists of a wounded and dying lion, of colossal size, in alto rilievo, sculptured on the side of a rock, in a kind of niche. The model for it was sent by Thorwaldsen from Rome. The names of the officers, 26 in number, who, with 760 soldiers, fell on that memorable occasion, as well as those officers, 16 in number, who, with about 350 soldiers, survived it, are engraved underneath. The lion is represented grasping a shield with a fleur-de-lys on it, and a bundle of broken arms with the Swiss cross are lying on one side.

Luzern contains 8150 inhabitants. It has two hospitals, a savings' bank, a friendly society, and other benevolent institutions. It has also a musical society, a collection of minerals, and very good elementary and secondary schools, each divided into three classes. Luzern is the principal of the Catholic cantons, and the Pope's nuncio resides here. (Leresche, *Dictionnaire Géographique Statistique de la Suisse*; also an anonymous work entitled *Slight Reminiscences of the Rhine and Switzerland*, 2 vols., London 1834, which contains some curious particulars of Luzern life, manners, and scenery.)

LUZON. [PHILIPPINE ISLANDS.]

LYCA'ON. [HYÆNA-DOG.]

LYCAO'NIA (*Λυκαονία*, and the inhabitants Λυκάονες), a district of Asia Minor, is first mentioned by Xenophon, who describes it as extending eastward from Iconium in Phrygia to the beginning of Cappadocia, a distance of 30 parasangs, about 110 English miles. (*Anab.*, i. 2, s. 19.) It was united during the Persian monarchy to the satrapy of Cappadocia. (Xen., *Anab.*, vii. 8, s. 25.) But in the time of Strabo the name of Lycaonia was applied to the south-eastern part of Phrygia; and it was bounded on the south by Mount Taurus, on the east by Cappadocia, and on the west by Pisidia.

Lycaonia is described by Strabo as high table-land, deficient in water, which the inhabitants could only procure by digging deep wells, but well adapted for sheep, of which Amyntas had upwards of 300 flocks (xii. c. vi., vol. iii., p. 58, 59, *Tauchnitz*). Iconium, the principal town of Lycaonia, called by Abulfeda *Kunijah*, and at present *Konieh* (Strabo, *ut supra*; Cic., *Fam.*, xv. 4; Plin., *Nat. Hist.*, v. 25), was situated in a fertile plain at the foot of Mount Taurus. Konieh contains at present a population of about 30,000 inhabitants. (Hassel, *Erdbeschr. Asiens*, ii. 197.) Isauria is mentioned by Strabo as part of Lycaonia; it contained the cities of Laranda, Lystra, and Derbe; the two last of which were visited by Saint Paul, and appear, from the narrative in the *Acts*, to have been places of considerable importance. (*Acts*, xiv. 6.)

The northern part of Lycaonia was united, but at what time is uncertain, to Galatia; but the southern part was governed in the time of Cicero (*Fam.* xiii. 73) by an independent prince of the name of Antipater, who resided at Derbe. Antipater however being afterwards conquered by Amyntas, king of Galatia, the whole of Lycaonia fell under the power of the Galatians. At the death of Amyntas, B.C. 25, Lycaonia, together with Galatia, became a Roman province. (Dion Cass., liii., p. 5[illegible], *Stephan.*) In the time of Pliny Lycaonia formed a separate tetrarchy, which contained 14 towns. (*Nat. Hist.*, v. 25.)

The language of Lycaonia mentioned in the *Acts*, xiv. 11, has occasioned much dispute among the learned; of which an account is given in Jablonsky's 'Opuscula,' ed. Te Water, iii. 3.

LYCESTA, Savigny's name for a genus of crustaceans, which M. Desmarest views as coming very near to the genus *Mæra* (Leach).

LY'CIA (*Λυκία*), a province of Asia Minor, was bounded on the north by Phrygia, on the east by Pamphylia, on the west by Caria, and on the south by the Mediterranean Sea. The interior of this country was entirely unknown till the recent visit of Mr. Fellows (1838), who travelled a considerable distance into the interior, and made many interesting discoveries, which will be shortly communicated to the world by the publication of his journal. We are informed by him that the country is erroneously represented in all the maps, and that there are no mountains of any importance in the interior. The coast is surrounded by lofty mountains, which rise in many places to a great height. Mount Solyma, called at present Takhatlu, to the north of Phaselis on the borders of Pamphylia, rises to the height of 7800 feet. [ANATOLIA, i., p. 473.] According to Strabo (xiv., c. iii., vol. iii., p. 213, *Tauchnitz*) there is a great number of good harbours, notwithstanding the rocky nature of the coast. The length of the coast, from Telmissus on the west to Phaselis on the east, is said by Strabo to be 1720 stadia. The northern part of Lycia is occupied by the mountains which support the high table land of Phrygia on the south, and which appear to have been known to the antients under the name of Massicytus. Mount Massicytus is erroneously placed in most maps in the centre of the country, where there are no mountains, according to Mr. Fellows. The Xanthus, which is also represented as an inconsiderable stream, is in reality a river of considerable length, flowing from the mountains in the north of Lycia; and the whole of the interior, instead of being occupied by mountains, as was commonly thought, is, on the contrary, a fertile plain, surrounded by mountains on every side, and drained through its whole extent by the river Xanthus.

According to Herodotus the Lycians were originally called Milyans, and afterwards Solymi; but again changed their name to that of Termilæ, after Sarpedon settled in the country, having been compelled to leave Crete in consequence of dissensions with his brother Minos. They were, according to the same authority, eventually called Lycians from Lycus, the son of Pandion, who came to Lycia after he had been expelled from Athens by his brother Ægeus. (Herodot., i. 173. Compare Strabo, vol. iii., p. 217, 218.) In the Homeric poems the country is always called Lycia, and the Solymi are mentioned as a warlike people against whom Bellerophon is sent to fight by the king of Lycia (*Il.*, vi. 184). In later times the southern part of Phrygia, on the north of Lycia, was always called Milyas; but the people are never called Solymi, though the name still remained in Mount Solyma on the north-eastern coast. That Lycia was early colonized by the Greek nation is evident, not only from the account of Herodotus, but also from many other Lycian traditions, as well as from the worship of Apollo, which was spread over the whole country. Xanthus was a Cretan settlement (Steph. Byz.), and 60 stadia below the town was a grove sacred to Latona, near an antient temple of the Lycian Apollo (Strabo, vol. iii., p. 215; Diod., v. 56). But the chief temple was at Patara, the winter habitation of the god, where he gave oracles through the mouth of a priestess. (Müller's *Dorians*, i., p. 245, Engl. transl.)

The Lycians appear to have obtained considerable power in early times. They were almost the only people west of the Halys who were not subdued by Crœsus (Herodot., i. 28); and they made an obstinate resistance to Harpagus, the general of Cyrus, but were eventually conquered. (Herodot., i. 176.) They supplied Xerxes with fifty ships in his expedition against Greece. (Herodot., vii. 92.) After the downfall of the Persian empire they continued subject to the Seleucidæ till the conquest of Antiochus by the Romans, when their country, as well as Caria, was granted by the conquerors to the Rhodians (Polyb., p. 848, *Casaubon*); but their freedom was afterwards again secured to them by the Romans (Polyb., p. 925), who allowed them to preserve their own laws and their political constitution, which is greatly praised by Strabo. According to this account (vol. iii., p. 214) the government was a kind of federation consisting of 23 cities, which sent deputies to an assembly, in which a governor was chosen for the whole of Lycia, as well as judges and inferior magistrates. All matters relating to the government of the country were discussed in this assembly. The six principal cities, Xanthus, Patara, Pinara, Olympus, Myra, and Tlos, had three votes each; other cities two votes each; and the remainder only one each. In consequence of dissensions between the different cities, the constitution was abolished by the emperor Claudius (Suet., *Claud.*, c. 25; compare *Vespas.*, c. 8); and the country united to the province of Pamphylia. (Dion. Cass., lx., p. 777, *C. Steph.*)

Lycia contained many cities of considerable importance. Pliny (*Nat. Hist.*, v. 28) mentions 36, but says that there were formerly as many as 70. Telmissus, on the borders of Caria, a seaport with a good harbour, must have been a place of some importance in the time of Crœsus (Herodot., i. 78), but afterwards declined in power; it is mentioned by Strabo as a small place. South of Telmissus, on the coast, were the towns of Pydna, Cragus, and Patara; the last of which is described by Strabo as a large city with many temples in it, and is said by Livy (xxxvii. 15) to have been the capital of Lycia. According to Pliny, the antient name of this town was Sataros (*Hist. Nat.*, v. 28); but the name was afterwards changed by Ptolemy Philadelphus into Arsinoe. (Strabo, vol. iii., p. 215, 216.) To the north of Patara, on the river Xanthus, were the towns of Xanthus (which was burnt by its inhabitants, when they could no longer resist Brutus) and Tlos; and to the east, along the coast, those of Myra (mentioned in the *Acts*, xxvii. 5, as a seaport, but placed in most maps in the interior), Limyra, and Olympus. The position of Pinara is doubtful: it is put down in the maps on the river Xanthus, above the town of the same name; but the numerous inscriptions which Mr. Fellows found at this spot, called at present *Doover*, prove that this was the position of Tlos. Between Myra and Olympus was the sacred promontory, stretching out a considerable distance into the sea, off which were the Chelidonian islands. On the borders of Pamphylia was the important town of Phaselis, founded by the Dorians. (Herodot., ii. 178.) It had three harbours (Strabo, vol. iii., p. 217), and was one of the most flourishing commercial cities on the southern coast of Asia Minor. It was one of the principal resorts of the Cilician pirates in the later times of the Roman republic, and was destroyed for this reason by Paulus Servilius. (Cic., *Verr.*, vi. 10.) It was afterwards rebuilt, and is mentioned by Lucan (viii. 251); but it never recovered its former importance.

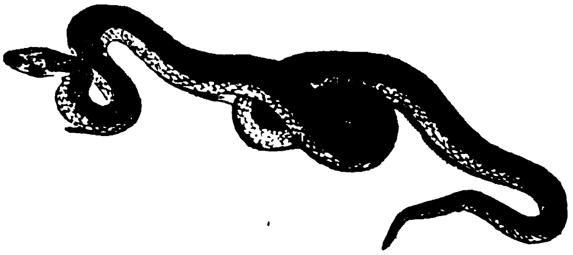
LY'CIUM. Many antient authors, and among others Dioscorides, describe under the above name a substance used in medicine, which is stated to be of two kinds; one obtained from Lycia and Cappadocia, and the other from India. The former is said to be the produce of a thorny shrub called Pyxacantha. The latter is stated to be more valuable and efficacious as a medicine, and to be produced also by a thorny shrub which is called Lonchitis.

Most modern authors have stated these plants and the substance they produce to be totally unknown; others consider species of Rhamnus, or the common box, to be alluded to. Prosper Alpinus thought Berberis Cretica to be one of the plants; while Garcias ab Orto thought Catechu to be the substance, and Acacia Catechu the plant yielding it. It is possible that some species of Rhamnus, as R. infectorius, of which both the root, wood, and berries possess medicinal properties, and which are in the present day used for dyeing yellow, may have formed one of the kinds of Lycium, as it is common in the countries where the first kind is said to have been produced, and some species of Rhamnus were by the older botanists called Lycium. Though there is uncertainty about the Lycium of Asia Minor, that of India seemed to have been quite unknown till the publication of a paper 'On the Lycium of Dioscorides,' by Dr. Royle, in the Linnean Society's Transactions for [illegible], where it is stated that there is no proof that Catechu is the λύκιον ἰνδικόν (*Lycium indicum*) of the antients; in fa[illegible] incompatible with the evidence adduced on the subject from Oriental writers. The Greek authors on medicine having been translated into Arabic, and from this language into Persian, and these, with additions, forming the works now in use in India, we may expect to find in them some trace of Lycium; and in fact in that called *Makhzun-al-Udwish; loofyon* is mentioned as the plant which yields *huziz*, and in Persian it is called *feel-zukreh*. *Loofyon* is evidently written for *lookyon*, through an error of the transcriber in a diacritical point, in the same way that Filafoos (Philip of Macedon) has been changed in some of these works into *Filakoos*. This is further evident indeed from referring to the Latin translations of Serapion and Avicenna, where *hadad* and *feel-zuhuruj* are translated Lycium and Lycium indicum. In the Persian work, hoozuz or hooziz (the same word as hadad) is described as being of two kinds: one from India, of which the Hindee name is *rusot;* and the other from Arabia. The Persian name *feel-zukreh* is translated in our best dictionaries 'box-thorn,' that is, Pyxacantha. The best kind of rusot is said, in the *Makhzun-al-Udwieh*, to be brought from Nuggur-kote in the neighbourhood of Lahore, and that it is an extract made from a decoction of the fresh wood of *dar-huld*. On inquiring in the shops of the druggists in the bazars of India, Dr. R. learned that both the wood *dar-huld* and the extract *rusot* were imported into the plains of India from the Himalayas. On travelling in these mountains, and on wishing to be shown the plant which produced the wood called *dar-huld* as well as that from which the *rusot* was procured, species of Berberry were immediately pointed out, and it was stated that both the wood and the extract were procured indifferently from *Berberis asiatica*, *B. asistata*, *B. Lycium*, and *B. pinnata*. On cutting into the wood of each, and having some converted into extract, he found both to correspond in every respect with what he had bought in the plains under the name of *dar-huld* and *rusot*. The extract *rusot* is procurable in the bazars of India, being much employed by the native practitioners of medicine in India, as an external application rubbed over the swollen eye-lid either simply or in combination with opium and alum and a little water or oil, both in incipient and chronic inflammation of the eye. The wood of Berberry being employed both in Europe and India as a yellow dye, it has been suggested by Mr. E. Solly, in a paper read before the Royal Asiatic Society, that the root, wood, or extract might be imported from India for the use of the manufacturers of Europe. This notice may appear disproportioned to the importance of the subject, but it is interesting as showing the knowledge which the Greeks had of the products of India, at the same time that it proves the great extent to which the influence of their own works has spread.

LY'CODON, a genus of serpents.

Example, *Lycodon Capensis*, Smith (*Lycodon Horstokii*, Schlegel).

Description.—Shining greenish-brown above, head without variations, and the scales along the middle of the back less distinctly marked with white specks than those of the sides.



Lycodon Capensis (Smith), var.

Dr. Smith, who recorded this species in 1831, in the 'South African Quarterly Journal,' figures and describes, in the 4th number of the 'Illustrations of the Zoology of South Africa' (1838), now in the course of publication,* a variety of a shining blackish-green colour above, tinged with purple, the head reticulated with white lines, and the scales white at the tips; greenish-yellow below; eyes livid-green. Length from nose to tail 12 inches; of the tail two inches.

Locality of the variety above described,—among decayed wood, near a small stream, immediately beyond Kurrichane, lat. about 25° south.

Habits, &c.—'When,' continues Dr. Smith, 'by the removal of some of the rotten masses, the reptile was exposed, it moved slowly among the remaining ones in search of a place of concealment; and when it was interrupted in its advance, it simply coiled itself up without manifesting any disposition to resist the opposition offered; a similar course I had previously observed others of the same species pursue when attempts were made to secure them; and neither did the one here described nor the others ever move with any considerable rapidity, nor appear much in fear of their assailants. All the specimens which I have seen of this species were obtained in damp situations, and never remote from localities where they could rapidly and without much exertion conceal themselves if necessary; and in the latter respect they resemble most of the innocuous snakes of South Africa, which are not endowed with the powers of effecting rapid movements.

LY'COPUS EUROPÆUS, a wild plant inhabiting wet ditches and sides of ponds, belonging to the natural order Labiatæ, and known popularly under the name of gipsywort, because gipsies are said to stain their skins with its juice.

LYCOPERDON, a genus of fungi, emitting when burst, either by violence or natural dehiscence, a quantity of dust-like seeds or spores, whence the species are commonly called puff-balls. The old botanists collected under this name a variety of plants, very different from each other in many respects, although agreeing in the circumstance just mentioned: recent writers have distinguished them as so many distinct genera. The only two which it is necessary to mention here are the common puff-balls, which burst irregularly, and the starry puff-balls, which split in a definite stellate manner. They are each inhabitants of meadows, pastures, woods, lawns, &c., and some of the species are exceedingly common. When the common puff-ball, Lycoperdon gemmatum, first appears, it forms a whitish ball, looking like a common eatable mushroom, but by degrees it changes colour, becomes brown, and tearing irregularly at the apex, discharges a cloud of brownish dust, consisting entirely of its spores. The Geasters, or starry puff-balls, are much less common; instead of bursting irregularly at the apex when ripe, their outer rind separates into a definite number of lobes, which spread open, curve backwards, and at last elevate upon their centre a bag containing the spores. No use has ever been made of any of the Lycoperdons, except in the case of L. giganteum, a very large indehiscent species, often many feet in circumference, and filled with a loathsome pulpy mass, which has been employed as a styptic, and for tinder.

LY'COPHRIS. [FORAMINIFERA, vol. x., p. 348.]

LY'COPHRON, a native of Chalcis in Eubœa, the son of Socles, and adopted by the historian Lycus of Rhegium, was a distinguished poet and grammarian at the court of Ptolemy Philadelphus, from B.C. 280 to B.C. 250, where he formed one of the seven poets known by the name of Pleias. He is said by Ovid to have been killed by an arrow. (*Ibis*, 531.)

Lycophron wrote a great number of tragedies, the titles of many of which are preserved by Suidas; but only one has come down to us, entitled 'Cassandra, or Alexandra.' This poem however cannot have any claims to be called a drama; Cassandra is the only person introduced as speaking; and she narrates to Priam the destruction of Troy, and the subsequent adventures and misfortunes of the Grecian chiefs. But in the course of her narration she gives an account of almost all the leading events in Greek history, from the Argonautic expedition to the time of Alexander the Great. The work is written in iambic verse, and has no pretensions to any poetical merit; the style is very obscure, and the meaning of most passages very doubtful, which led Statius to describe it as the 'Latebras Lycophronis atri.' (*Silv.*, v. 3, 157.) But from the quantity of mythological and historical information which it contained, and perhaps from its very obscurity, it formed a favourite study with the Greek grammarians, who wrote many commentaries upon it; of which the most celebrated by Tzetzes, who lived in the 12th century of the Christian æra, is still extant, and affords no small assistance in making out the meaning of this difficult poem.

---

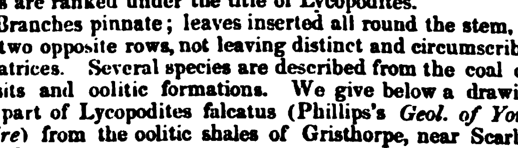
* Published under the authority of the Lords Commissioners of Her Majesty's Treasury, and containing beautiful and accurate figures, with excellent descriptions, of the animals of South Africa, collected during an expedition into the interior in the years 1834, 1835, and 1836; fitted out by the 'Cape of Good Hope Association for exploring Central Africa.'

The 'Cassandra' was printed for the first time at the Aldine press, Venice, 1513. The best editions are by Potter, Oxf. 1697, 1702; by Reichard, Leip. 1788; by Sebastian, Rome, 1804; and by Bachmann, Leip. 1833. The commentary of Tzetzes has been published with most of the editions of the 'Cassandra;' and has also appeared in a separate form under the superintendence of C. G. Müller, Leip. 1812 The 'Cassandra' has been translated into English by Lord Royston.

LYCOPODIA'CEÆ, a natural order of vascular Acrogens, chiefly consisting of moss-like plants, inhabiting moors, boggy heaths, and woods in many parts of the world. They never exceed the height or length of two or three feet, and usually grow prostrate, having their stems covered with numerous imbricated scale-like leaves, which, at the ends of the branches bear in their axils bivalve cases containing an inflammable powder, sometimes extremely fine, and used for artificial fireworks, which is supposed to be their spores. No distinct trace of two kinds of sexes has been found in these plants, which seem to have no very close allies among existing races. Their resemblance to ferns, near which systematists always place them, chiefly consists in their being asexual, and having spiral vessels in their stems. Some of them, especially Lycopodium rubrum, are violent purgatives, and it has been proposed to use others as dyes, but in general they are of little importance to any except the botanical systematist. Their name has however of late been brought frequently before the public in popular works, in consequence of an opinion that certain large fossils common in the coal-measures, and called Lepidodendra, are the relics of an extinct gigantic race of these now pigmy species. This opinion has been formed upon the supposition that the dichotomous mode of branching, common in Lycopodiaceæ, is a circumstance of paramount importance in determining natural affinities, and that the Lepidodendra were asexual. The latter is however not proved, nor indeed very probable, and the internal anatomy of Lepidodendron Harcourti has been shown, in the 'Fossil Flora,' to be unfavourable to the supposition. (*Fossil Flora*, article 'Lepidodendron Harcourti;' and Adolphe Brongniart's *Végétaux Fossiles*, article 'Lycopodiaceæ.')

LYCOPODITES. The affinity of many fossil plants to some of the various genera composing the Lycopodiaceæ is very distinctly pointed out by M. Brongniart, both in the 'Prodrome' (1828) and in the 'Histoire des Végétaux Fossiles.' Such of these as agree in the following characters are ranked under the title of Lycopodites.

Branches pinnate; leaves inserted all round the stem, or in two opposite rows, not leaving distinct and circumscribed cicatrices. Several species are described from the coal deposits and oolitic formations. We give below a drawing of part of Lycopodites falcatus (Phillips's *Geol. of Yorkshire*) from the oolitic shales of Gristhorpe, near Scarborough.



a, leaf magnified to show the direction of the nervures.

LYCO'RIS, Savigny's name for a genus of *Dorsibranchiate Annelids* (*Nereids*, properly so called) of Cuvier. See Savigny (*Eg. Annel.*), and Cuvier (*Règne Animal*).

LYCURGUS. [SPARTA.]

LYCURGUS, the Athenian orator, the son of Lycophron, and the grandson of Lycurgus, who is ridiculed by Aristophanes (*Birds*, l. 1296), was one of the warmest supporters of the democratical party in the contest with Philip of Macedon. The time of his birth is uncertain, but he was older than Demosthenes (Liban., *Arg. Aristogiton*); and if his father was put to death by the Thirty Tyrants (*Vitæ Decem Orat.*, p. 841, B.), he must have been born previous to B.C. 404; but the words of the biographer are, as Mr. Clinton has justly remarked (*Fast. Hell.*, vol. ii., p. 151), ambiguous, and may imply that it was his grandfather who was put to death by the Thirty.

Lycurgus is said to have received instruction from Plato and Isocrates. He took an active part in the management of public affairs, and was one of the Athenian ambassadors who succeeded (B.C. 343) in counteracting the designs of Philip against Ambracia and Peloponnesus. (Demosth., *Philip*, iii., p. 129, ed. Reiske.) He filled the office of treasurer of the public revenue for three periods of five years, that is, according to the antient idiom, twelve years (Diod. Sic., xvi. 88); and was noted for the integrity and ability with which he discharged the duties of his office. Böckh (*Public Economy of Athens*, vol. ii., p. 183, Engl. transl.) considers that Lycurgus was the only statesman of antiquity who had a real knowledge of the management of finance. He raised the revenue to twelve hundred talents, and also erected during his administration many public buildings, and completed the docks, the armoury, the theatre of Bacchus, and the Panathenaic course. So great confidence was placed in the honesty of Lycurgus, that many citizens confided to his custody large sums of money; and shortly before his death he had the accounts of his public administration engraved on stone and set up in part of the wrestling-school. An inscription, preserved to the present day, containing some accounts of a manager of the public revenue, is supposed by Böckh (*Public Economy of Athens*, vol. i., p. 264) to be a part of the accounts of Lycurgus. (See the inscription in Böckh's *Corpus Inscriptionum Græcarum*, vol. i., p. 250, No. 157.)

After the battle of Chæronea (B.C. 388) Lycurgus conducted the accusation against the Athenian general Lysicles. He was one of the orators demanded by Alexander after the destruction of Thebes, B.C. 335. He died about the year B.C. 323, and was buried in the Academia. (Pausan., i. 29, § 15.) Fifteen years after his death, upon the ascendency of the democratical party, a decree was passed by the Athenian people that public honours should be paid to Lycurgus; a brazen statue of him was erected in the Ceramicus, which was seen by Pausanias (i. 8, § 3), and the representative of his family was allowed the privilege of dining in the Prytaneum. This decree, which was proposed by Stratocles, has come down to us at the end of the 'Lives of the Ten Orators.'

Lycurgus is said to have published fifteen orations (*Vitæ Dec. Orat.*, p. 843, C.; Photius, *Cod.*, 268); of which only one has come down to us. This oration, which was delivered B.C. 330, is an accusation of Leocrates (κατὰ Λεωκράτους), an Athenian citizen, for abandoning Athens after the battle of Chæronea, and settling in another Grecian state. The eloquence of Lycurgus is greatly praised by Diodorus Siculus (xvi. 88), but is justly characterized by Dionysius of Halicarnassus as deficient in ease and elegance (vol. v., p. 433, ed. Reiske).

The best editions of Lycurgus are by Taylor, who published it with the 'Oration of Demosthenes against Midias,' Camb., 1743; Becker, 1821; Pinzger, 1824, Blume, 1827; and Baiter and Saupp, 1834. It is also included in the edition of the 'Oratores Græci,' by Reiske and Bekker, and has been translated into French by Auger, Paris, 1783.

(Dionysius of Halicarnassus; *Life of Isocrates*, attributed to Plutarch; Preface to Taylor's edition of Lycurgus; Nissen's dissertation, *De Lycurgi Oratoris Vita et Rebus gestis*, 1833. Compare Böckh's *Public Economy of Athens*, vol. i., pp. 264-269; vol. ii., pp. 183-188, Engl. transl.)

LYCUS, River. [ANATOLIA.]

LYDFORD, a village in the west of Devonshire, seven miles north of Tavistock, now almost deserted, and visited only for the sake of a waterfall or cataract in the Lyd, near a bridge where the stream is pent in between high rocks. When the river is full, this waterfall is a very pleasing object, though Risdon ('Survey of Devon') says, 'It maketh such an hideous noise, that being only heard and not seen, it causeth a kind of fear to the passengers, seeming to them who look down to it, a deep abyss, and may be numbered among the wonders of the kingdom.' This now insignificant village was formerly a frontier town of considerable strength and importance, having 140 burgesses within the walls, and many without, and protected by a castle, erected probably by the Saxons, when they had driven the West Britons across the Tamar. Lydford was burnt by the Danes in 997. It is recorded in Domesday as a manor and borough in antient demesne, having formed part of the possessions of the crown in the time of Edward the Confessor, and as not being liable to any impost, except at the same time, and for the same causes, as London. Lydford appears however to have been tallaged with Exeter, Axminster, Witeford, and ten other towns, in 20 Henry II.

(1174); and in the fifth year of John (1203), that king, for the small sum of 5 marks (3*l.* 13*s.* 4*d.*), entered into an engagement with H. de la Pomeraie, that he would not grant to the burgesses of Lydford better liberties than those enjoyed by the citizens of Exeter. (Madox, *Exch.*, 282, note (t.) 485.) When in the possession of his son Richard, king of the Romans, it had a market, which had been renewed in 1130 (' Magn. Rot. Scacc.') and a fair. (*Cal. Rot. Chart.*, 97, 102.)

The parish of Lydford is one of the most extensive in the kingdom, including the high morass called the Chace or Forest of Dartmoor, formerly Dertemore, which occupies the centre of the county of Devon.

Lydford, with Dartmoor, was commonly annexed in royal grants to the earldom of Cornwall, and in 6 Edward II., after the forfeiture of Gaveston, we find Thomas Le Ercedekne committee of the earldom (1 *Abbr. Rot.*, Origin. in Scacc. 186, 195, 196), and also constable of Lydford Castle, and keeper of the forest of Dartmoor. (*Ibid.* 196 b.) Lydford and Dartmoor were inalienably incorporated with the dukedom of Cornwall upon its creation in 1339, in favour of the Black Prince.

Lydford Castle, sometimes called the castle of Dartmoor, (*Cal. Rot. Pat.*, 249) is an extensive building, though now very dilapidated. It is the Stannary Castle, and contains the rooms where the warden of the stannaries of Devon, an office sometimes granted to the abbot of Tavistock (2 *Parl. Rolls*, 10 b.), or the vice-warden, held his stannary courts; it had dungeons for the reception of delinquent tinners. By the charter of Edward I., the tinners of that county were not to be imprisoned elsewhere. In the last year of this king's reign, the warden of the stannaries claimed the body of a tinner who had been imprisoned upon a charge of killing his brother's son; but upon an inspection of the charter it was found to contain a reservation of cases of life and member. The privilege of imprisoning at Lydford became the subject of a complaint in parliament at the close of the reign of Edward III., 1377, when it was asserted by the commons, that the warden of the stannaries took prisoners arrested for arrearages of account out of other gaols and kept them at Lydford, where there was sometimes no gaol delivery for ten years, and where these supposed tinners were so favourably treated, that they thought of anything but paying their debts. (2 *Parl. Rolls*, 344.) This complaint does not seem to accord with the popular notion that 'by Lydford law' men are hanged first and tried afterwards.

The parliaments, or convocations, of tinners for Devon, were held on a high rock in Dartmoor, called Crockern Torr, where stood a table and seats, the whole being hewn out of the granite surface, without any neighbouring building or protection from the weather. The stannators of the stannaries of Devon (called sometimes the stannaries of Dartmoor, *Cal. Rot. Pat.*, 23 b.), who composed these parliaments, were elected by the mayors, or other chief magistrates, of the four coinage towns, Chagford, Ashburton, Plympton, and Tavistock, though in the beginning of the reign of Edward III. there appears to have been a contention between the latter place and the three former, as to the privilege of coinage. (*Cal. Inq. post Mort.*, 10.) The table, round which these legislators assembled, and the seats which they occupied, have ceased to exist. These interesting remains were some years since broken to pieces and removed by the workmen of the late judge Sir Francis Buller, who, unfortunately for those who respect the relics of by-gone usages, had purchased an estate in this parish, and the fragments of these venerable monuments were employed in the construction of a modern mansion.

Like other border districts Lydford presents some peculiarities in respect of tenures. It is said (5 *Co. Rep.*, 84) the custom of Lydford Castle is, that freeholders of inheritance cannot pass their freeholds except by surrender into the hands of the lord. This particular form of restriction upon alienation appears to have been by no means unusual. (' Year Book,' 14 Henry IV., fo. 1.) Risdon mentions other peculiarities annexed to the tenures of the freeholders in Lydford, called the Fenfield men, formerly the Fengfield men. The term may have been originally ' fangfield,' the Anglo-Saxon (and German) verb ' fangen,' to receive (preterite 'fing'), being still current throughout Devonshire, where however the preterite is become regular, 'fanged.'

Though Dartmoor is a bleak unsheltered morass, we find that in the time of Henry III. 'David de Seyredun held a yard-land (virgata terræ, sometimes 20, sometimes 48 acres) in Seyredun and Sappesby, by the service of the serjeanty of finding two arrows when the king came to hunt in the forest of Dartmoor, and so held his ancestors since the Conquest' (Testa de Nevile, 195), and that Richard de Droscombe held a yard-land of the (yearly) value of half a mark (6*s.* 8*d.*), in the hundred of Exminster by the serjeanty of carrying the king's bow when he hunted in Dartmoor (*Ibid.*, 196). It also appears that the service of Odo *le Archer* in Droscomb was to present a bow and three arrows when the king hunted in Dartmoor (*Ibid.* 197).

LYDGATE, JOHN, an antient English poet, one of the successors of Chaucer, was a monk of the Benedictine abbey of Bury St. Edmund in Suffolk. The dates of only a few of the events of his life have been ascertained. He was ordained a subdeacon in 1389, a deacon in 1393, and a priest in 1397; whence it has been conjectured that he was born about 1375. Warton says he seems to have arrived at his greatest eminence about the year 1430. After a short education at Oxford, he travelled into France and Italy, and returned a complete master of the language and literature of both countries. He chiefly studied Dante, Boccaccio, and Alain Chartier, and became so distinguished a proficient in polite learning, that he opened a school in his monastery for teaching the sons of the nobility versification and composition. Although philology was his subject, he was not unacquainted with the philosophy of the day: he was not only a poet and a rhetorician, but a geometrician, an astronomer, a theologist, and a disputant. Warton was of opinion that Lydgate 'made considerable additions to those amplifications of our language, in which Chaucer, Gower, and Occleve led the way;' and that he was the first of our writers whose style was clothed with that perspicuity in which the English phraseology appears at this day to an English reader.

To enumerate Lydgate's pieces would be to write the catalogue of a little library; Ritson, in his 'Bibliographia Poetica,' has given a list of no fewer than two hundred and fifty-one. No poet seems to have possessed greater versatility. His most esteemed works are his ' Story of Thebes,' his ' Fall of Princes,' and his ' History, Siege, and Destruction of Troy.' The first is printed by Spight in his edition of Chaucer; the second, the 'Fall of Princes,' or 'Boke of Johan Bochas' (first printed by Pynson in 1494, and several times since), is a translation from Boccaccio, or rather from a French paraphrase of his work, ' De Casibus Virorum et Feminarum Illustrium.' 'The History of Troy' was first printed by Pynson in 1513, but more correctly by Marshe in 1555, and was once the most popular of his works.

A pension of 7*l.* 13*s.* 4*d.* for life was granted to Lydgate by King Henry VI. in 1440, probably upon the presentation to that monarch, when he visited St. Edmunds Bury, of a MS. Life of St. Edmund, the patron saint of the monastery. This manuscript is still preserved in the Harleian collection in the British Museum, No. 2278, and is one of the most splendidly illuminated MSS. in that great repository, which also contains in the old Royal, Cottonian, Harleian, and Lansdowne Collections, other splendid manuscripts of Lydgate's various poems.

A note in Wanley's part of the Harleian Catalogue of Manuscripts seems to insinuate that Lydgate did not die till 1482, which is improbable. He was certainly alive in 1446; and the best authorities place his death about 1461.

(Warton's *Hist. Eng. Poet.*, 4th edit., vol. ii., p. 51-100; Ritson, *Bibliographia Poetica*, p. 66-90; Ellis's *Specimens*; Chalmers's *Biogr. Dict.*, vol. xxi., pp. 5, 6.)

LY'DIA (Λυδία), a country of Asia Minor. It is difficult to determine its exact boundaries, as they differed at various times; but under the Roman empire it was bounded on the south by Caria, from which it was separated by the river Mæander; on the north by a range of mountains known under the name of Sardene, which divided it from Mysia; on the east by Phrygia; and on the west by the Ægean, though the tract of country along the coast was more commonly known by the name of Ionia. Lydia was intersected by mountain-ranges, running from east to west; of which the principal, called Méssogis by Strabo, is a branch of Taurus, and forms the northern boundary of the valley of the Mæander. Another chain of mountains, known to the antients under the name of Tmolus, which appears to detach itself from the Méssogis near the borders of Phrygia, runs parallel to the Méssogis through the centre of Lydia and terminates on the western coast opposite the island of Chios. A branch of Tmolus, called Sipylus, stretches more to the north-west towards the towns of Cuma and Phocæa. The chain of mountains which separates Mysia from Lydia appears to be a continuation of the northern range known in Bithynia by the name of Olympus, and in Mysia by that of Ida and Temnon. Lydia is thus divided into two principal valleys; the southern, between Méssogis and Tmolus, through which the Caystrus flows, is of moderate extent; but the northern, between Tmolus and Sardene, watered by the Hermus, and its tributaries the Hyllus, Pactolus, and Coganus, forms a considerable plain. The fertility of Lydia and the salubrity of the climate are frequently mentioned by antient writers; and this account is confirmed by the reports of modern travellers. (Chandler's *Travels in Asia Minor*, p. 260; compare Arundell's *Visit to the Seven Churches of Asia.*) Chishull speaks of the country between Tmolus and Méssogis as a 'region inexpressibly delicious.'

The origin of the Lydian people is uncertain. Some writers, and among others Josephus (*Antiquit.*, i. 6, 4), have imagined that they are mentioned in the book of *Genesis* (x. 22) under the name of Lud (לוד); in which passage they are described as descendants of Shem. Homer does not appear to have known the name of Lydia, but always calls the people Mæones. According to most antient writers, the people were originally called Mæones, and obtained the name of Lydians from Lydus, the son of Atys, who is mentioned by tradition as the first king of the country. (Herodot., i. 7; Diod. Sic., iv., p. 237, Rhodoman; Pliny, *N. H.*, v. 30.) Later writers make a distinction between Mæonians and Lydians, and represent the former as dwelling on the north-east of Tmolus, near the river Hyllus, and the Lydians as inhabiting the southern part of the country. According to Herodotus, the Lydians were of a common origin with the Carians and Mysians (i. 171).

The early history of Lydia is related by Herodotus, who informs us that three dynasties ruled in Lydia: the *Atyadæ* from the earliest times to B.C. 1221; the *Heraclidæ* from B.C. 1221 to 716; and the *Mermnadæ* from B.C. 716 to 556. The proper history of Lydia can only be said to begin with the last of these dynasties; since the two first are almost entirely fabulous. The following is a list of the Mermnadæ princes: 1. Gyges, who obtained the throne by the murder of Candaules, the last of the Heraclidæ monarchs, reigned from B.C. 716 to 678. 2. Ardys, from B.C. 678 to 629. 3. Sadyattes, from B.C. 629 to 617. 4. Alyattes, from B.C. 617 to 560. [ALYATTES.] 5. Crœsus, from B.C. 560 to 556, though he was probably associated in the sovereignty during the lifetime of his father. [CRŒSUS.] These monarchs were engaged in almost uninterrupted wars with the Greek cities on the coast; but the empire steadily increased in wealth and power. It obtained its greatest prosperity during the reign of Crœsus, who subdued all the people of Asia Minor west of the river Halys (*Kisil-ermak*), with the exception of the Cilicians and Lycians. (Herodot., i. 28.) But this empire, the most powerful at that time in Western Asia, was overthrown by Cyrus (B.C. 556); and the country became a Persian province. Herodotus informs us that no nation in Asia was more warlike than the Lydians (i. 79); till, through the advice of Crœsus, they were deprived of their arms by Cyrus, and obliged to learn music and dancing (i. 154). After Alexander's conquests, Lydia, with the rest of Western Asia, formed part of the empire of the Seleucidæ; and on the conquest of Antiochus by the Romans, B.C. 189, it was given to Eumenes, king of Pergamus, as a reward for the assistance he had afforded them in their war against the Syrian monarch. (Liv., xxxvii. 56; Appian, *Syr.*, 38; 1 *Macc.*, viii. 8.) On the death of Attalus III., B.C. 133, it came, with the other dominions of the kings of Pergamus, into the power of the Romans.

The antient Lydians appear to have enjoyed great commercial prosperity and to have possessed abundance of the precious metals; as is evident from other circumstances, and particularly from the rich presents which Crœsus sent to the different oracles in Greece. (Herodot., i. 50.) The Lydians are said to have obtained a large quantity of gold which was washed down from the mountains by the river Pactolus; but there is no proof that they ever carried on the operation of mining. (Herodot., i. 93; v. 101; compare Heeren's *Researches*, &c., 'Asiatic Nations,' vol. i. p. 106, 107, Eng. transl.) But in the time of Strabo no gold was found in this river (xiii. 928); and if Herodotus had been misinformed, which is improbable since he visited Sardis, the tale might easily have arisen from the appearance of Mount Tmolus, which, according to a modern traveller, 'is adorned with bright and shining particles, resembling gold-dust.' (Chishull, quoted by Chandler, *Travels in Asia Minor*, p. 260.) The Lydians are said by the Greeks to have been the first people who put a stamp upon gold and silver; and they claimed to be the inventors of the games which were prevalent in Greece in the time of Herodotus (i. 94).

The most extraordinary work of art in antient Lydia was the enormous sepulchral mound of Alyattes, the father of Crœsus, erected a little to the north of the river Hermus. Herodotus classes it next to the great works of the Egyptians and Babylonians, and describes it as 6 stadia (about three-quarters of a mile) and 2 plethra (200 feet) in circumference; and 13 plethra (1300* Greek feet) in width. The basement was built of great stones, and the upper part of earth. (Herodot., i. 93.) Chandler visited the spot in which this mound is supposed to have been raised; he describes the ground as covered with earthen barrows or mounds of various sizes, and mentions one in particular, near the middle, larger than the rest, which he supposes to have been the sepulchral mound of Alyattes, and conjectures that the basement of stone is now concealed by the mould, which has been washed down from the top. (*Travels*, p. 263; compare Arundell's *Visit*, &c., p. 186.) In the neighbourhood of this mound is the lake known to the antients by the name of Gygæa. (Homer, *Il.*, ii. 864; Herodot., i. 93.) It is described by Chandler as large and abounding in fish; its colour and taste like common pond-water, with beds of sedge growing in it. (*Travels*, p. 262.)

The Grecian towns on the coast of Lydia are described under IONIA. The most important of those towns which properly belonged to Lydia were Sardis, Philadelphia, and Thyatira.

Sardis (Σάρδεις, Σάρδις, Σάρδιες), called at present *Sart*, is situated on the river Pactolus, a tributary of the Hermus, in the middle of an extensive plain. The citadel was remarkable for its strength, being situated on a lofty hill which was a perpendicular precipice on the back part, which looked towards Mount Tmolus. It is not mentioned by Homer, but some have conjectured that he speaks of it under the name of Hyde (ὕδη, *Il.*, xx. 385). Sardis was taken by the Cimmerians during their invasion of Lydia, in the reign of Ardys. (Herodot., i. 15.) It was the capital of the Lydian monarchy, and the residence of the Persian satraps of the country. It was burnt by the Athenians, B.C. 503 (Herodot., v. 100, 101); at which time the houses were principally made of reeds or straw, and those built of brick had thatched roofs. Under the Romans, Sardis formed the seat of a separate provincial government. ('Sardiana Jurisdictio,' Pliny, *N. H.*, v. 30.) It was nearly destroyed by an earthquake in the time of Tiberius (Tac., *Ann.*, ii. 47); but it was again rebuilt, and is frequently mentioned in the wars between the Greeks and Turks. Sart is at present a 'miserable village' (Chandler's *Travels*, p. 255); but there are large ruins of the antient Sardis in the neighbourhood.

Philadelphia (Φιλαδέλφεια) called at present *Allah Shehr* (that is, *City of God*), 28 miles south-east of Sardis (Anton. *Itin.*, p. 336), stands on a part of Mount Tmolus, by the river Coganus. This town was built by Attalus Philadelphus, king of Pergamus; and is still a place of some importance. Chandler speaks of it as 'a mean but considerable town, of large extent, spreading on the slopes of three or four hills.' (*Travels*, p. 249.) To the east of Philadelphia Strabo places the district of Katakekaumene, or *Entirely-burnt*, 500 stadia in length and 400 stadia in breadth (xiii. 628, *Casaub.*). Strabo was in doubt whether it ought to be reckoned as part of Mysia or Mæonia. He describes the surface of the plain as covered with ashes, and the mountain rocks as of a black colour, as if they had been subject to the action of fire. (Compare *London Geog. Journal*, vol. viii., p. 142.) The vine was cultivated in this district with great success.

Thyateira (Θυατείρα), called at present *Akhissar*, was built by Seleucus Nicator; though there appears to have been a small town on the same spot before his time, called Pelopia. (Steph. Byz.; Pliny, *N. H.*, v. 29.) Strabo mentions it as a colony of the Macedonians (xiii. p. 929). It was situate on the borders of Lydia and Mysia near the river Hyllus, on the road between Pergamus and Sardis. It was famous for the art of dyeing purple. (*Acts*, xvi. 14; and Kuinoel's note on the passage.) Thyatira, Philadelphia, and Sardis are three of the Seven Churches which are addressed in the Book of Revelations.

---

* In the article ALYATTES the width is erroneously stated at 2600 feet.

LYDIAN MODE. [MODE.]

LYDUS, JOANNES LAURENTIUS, was born at Philadelphia in Lydia (whence he derived his surname), about A.D. 490. At the age of twenty-one he repaired to Constantinople, and was employed for forty years at the court of the emperor in various official duties. He died about the latter end of Justinian's reign. Lydus appears to have been well acquainted with Greek and Roman antiquities; and his works, which are said to have been written after he had retired from the Imperial court, contain much curious information on the mythology and history of several of the nations of antiquity.

Three works of Lydus have come down to us: one 'On the Magistrates of the Roman Republic,' edited by Hase, Paris, 1812; a second, 'On the Months,' which was originally published by Schow, Leipzig, 1794, and has since been edited by Roether, Leipzig, 1827; and a third, 'On Omens and Prodigies,' which has also been published by Hase, with a facsimile of the MS. from which the edition has been printed. The best edition of Lydus is by Bekker, Bonn, 1837, which forms a part of the 'Corpus Scriptorum Historiæ Byzantinæ.'

LYE, EDWARD, born 1704, died 1767, an English clergyman, distinguished by the attention which he paid to the Saxon and Gothic languages and literature, was a native of Totness, educated in the university of Oxford, and beneficed in Northamptonshire. The living which he held was that of Houghton Parva, which he exchanged for that of Yardley Hastings. This appears to have been all the preferment he enjoyed.

The publications of Lye are all in that rare department of literature to which he especially devoted himself. The first was an edition of the manuscript left by Francis Junius [JUNIUS], entitled 'Etymologicum Anglicanum.' This manuscript had long lain in the Bodleian Library, no one having the courage or the knowledge and leisure sufficient to undertake the publication of it, to the great regret of all scholars both at home and abroad. This Lye accomplished, and the work appeared, with some additions and suitable prolegomena, in a folio volume, 1743. He also published, at the desire of Berzelius, bishop of Upsal, an edition of that singular remain of the Gothic language, the parent of many dialects, the translation of the Evangelists, commonly called Ulphilas's version. During the whole course of his studies he had kept in view the preparation of a large dictionary of the Anglo-Saxon and Gothic languages. This great undertaking he had just completed, having actually delivered the manuscript to the printer, when death took him away. His labour however was not lost, the work being published in 1772, in two folio volumes.

There is a fuller account of this eminent person in Nichols's 'Literary Anecdotes of the Eighteenth Century,' vol. ix., p. 751-753, a work abounding in exact and original information concerning nearly all the distinguished literary labourers of the century to which it relates.

LYME REGIS is a small and irregularly built seaport town in the parish of Lyme and county of Dorset, 20 miles west from Dorchester and 120 west-south-west from London. The streets are badly paved and not at all lighted, and the principal thoroughfare is so narrow, that the safety of foot-passengers is said to be endangered. The fish-market, held in the best part of the town, is regarded as a nuisance, and the butchers' shambles are erected in the main street. Indeed the corporation appear for many years to have altogether disregarded the improvement of the town. The charters of incorporation granted to the town date from the 12th Edward I. to the 26th Charles II., which last was acted upon until 1688, when it was recalled by a proclamation of James II. The revenue of the corporation in 1833 was 288*l.*, which was sufficient to cover its expenditure. This however is independent of the 'Cobb' or harbour dues, which amounted, in the year ending Sept. 30, 1833, to 417*l.*, the disbursements on account of the same during that period being 446*l.* That the trade of the port is rapidly declining appears from the circumstance, that in 1831 the number of vessels which entered and cleared with cargoes inwards, outwards, and coastwise, was 629, the aggregate tonnage of which amounted to 44,930; while in 1833 the number of vessels was only 201, and the corresponding tonnage 11,877. Indeed the harbour appears chiefly valuable as a place of refuge for small vessels during bad weather, as it is the only safe shelter between Lyme Regis and the Start Point of Portland. The church, dedicated to St. Michael, is an antient edifice. The living, a vicarage in the diocese of Bristol and patronage of the prebendaries of the cathedral of Sarum, is valued at 275*l.* per annum. In 1831 the population of the parliamentary borough, comprehending the parishes of Lyme and Charmouth, was 3345, that of the town alone being 2407. Until the passing of the Reform Act Lyme Regis had returned two members to parliament continuously from the reign of Edward I. It now returns but one member. (*Report of the Commissioners on the Corporation of Lyme Regis*, from which this notice is chiefly drawn.)

LYMFIORD. [JUTLAND.]

LYMINGTON is a corporate town and parliamentary borough of Hampshire. The town is agreeably situated on the right bank of the river Lymington, at a short distance from its mouth, and is 7 miles south-west by south from Southampton, and about 90 miles south-west from London. It is well supplied with water, and the paving and lighting are defrayed by a rate of 13½*d.* in the pound on houses, and 4½*d.* in the pound on land. 'Lymington is subordinate to the port of Southampton, from the necessity of the importers having to pay the full duties on the entrance of their cargoes into the port' (*Corp. Reports*), which circumstance is regarded by the inhabitants as a grievance, inasmuch as they consider the situation of their own port peculiarly favorable to foreign trade. The foreign trade is unimportant, and the coasting-trade is evidently on the decline, for it appears that the aggregate tonnage inwards and outwards, which in 1812 amounted to 44,934, had gradually decreased down to the year 1832, when the tonnage inwards was 10,757, and outwards 7242. The town has of late years received considerable improvements, with a view to invite visitors during the bathing season: 3000*l.* had been subscribed in 1835 for the erection of baths, and a like sum for the establishment of gas-works. The chief manufacture of the neighbourhood is salt, which some years ago was carried on to a considerable extent, but has since declined. The salt-works are situated on the bank of the Solent Channel, to the south-west of the town. The fairs for cheese are held May 12 and October 2, and are usually well attended. Lymington is a borough by prescription, there being no charter extant or upon record. The town-council consist of four aldermen and twelve common-councillors (5 and 6 William IV., c. 76), and the income of the corporation, arising from landed property, tolls, quay and river dues, amounted, in the year ending October, 1832, to 68*l.* 19*s.* 5*d.*, the expenditure during the same period being 79*l.* 12*s.* 4*d.* The parish church, dedicated to St. Thomas à Becket, is in the diocese of Winchester, and in its interior are many handsome monuments. The living is a curacy, dependent in some respects upon the church of Boldre, and the income is included in that of the vicarage of Boldre. The population of the town and parish in 1831 was 3361. Lymington has returned two members to parliament since the reign of Elizabeth. (*Boundary Reports; Corporation Reports*, &c.)

LYMNE'A. [LIMNEANS.]

LYMNO'REA (Zoology), Peron's name for a genus of *Medusæ*. This name comes too near to *Limnoria*. See that article.

LYMNO'REA, a genus of fossil zoophyta, proposed by Lamouroux (*Expos.*, p. 79). Also the name of a genus of recent Medusidæ. (De Blainville, *Actinologie*, p. 290.)

LYMPH, LYMPHATICS. The Lymphatics are the system of vessels which, from the part that they take in the process of absorption, are not unfrequently called absorbents. They consist of minute branched tubes of extremely delicate membrane, whose extremities are arranged in a more or less dense net-work in every part of the body. From this net-work they gradually converge into a succession of branches of increasing size, and terminate in two main trunks, called the right and left great lymphatic veins, through which the lymph is poured with the chyle from the thoracic duct [LACTEALS] into the right and left subclavian veins. The lymphatics also communicate with the veins at some other parts of their course, chiefly near their minute extremities, and more rarely by larger branches. They have in their interior numerous delicate valves formed of crescentic folds of the lining membrane, exactly like those of the veins [CIRCULATION, *fig.* 11], and, like them, preventing the retrograde course of the contained fluid. The valves of the lymphatics however are much more closely set than those of the veins, so that when full of fluid, the spaces between them being most distended, they give those vessels a knotted or beaded appearance, by which they are easily distinguished from veins of the same size. In the course of the larger lymphatics there are numerous firm roundish or oval bodies, called lymphatic or absorbent glands. [GLAND.] To each of these there pass two or more lymphatic vessels, which on entering them become extremely tortuous, and after varied convolutions and anastomoses, terminate in nearly the same number of branches, which again pass from the gland and pursue their course towards the main trunk.

The *Lymph* is a thin opaline whitish fluid of a somewhat saline taste, which a short time after it is removed from the body separates into a clear fluid and a soft white or pinkish coagulum. It is extremely difficult to obtain, in consequence of the small size of the lymphatic vessels; but in the rare cases in which a sufficient quantity has been procured for analysis, it has presented the same constituents as the blood deprived of its colouring globules. The coagulum consists of nearly pure fibrine, and the fluid portion is a solution of albumen with alkaline salts.

The physiology of the Lymphatics is explained in the article ABSORPTION.

The name of Lymph is rather vaguely applied to many different morbid secretions which have a thin watery appearance. Coagulating or coagulable Lymph is the fibrinous matter effused in the adhesive inflammation. [INFLAMMATION.]

LYNCEUS. [BRANCHIOPODA, vol. v., p. 342.]

LYNCHBURG. [VIRGINIA.]

LYNN, distinguished as LYNN REGIS, or KING'S LYNN, a parliamentary borough, port, and market-town in the hundred of Freebridge Lynn, in the county of Norfolk, is on the right or east bank of the river Ouse, a little above its outfal, in 52° 45′ N. lat. and 0° 25′ E. long., about 88 miles in a straight line north by east of St. Paul's, London, or 96 miles from Shoreditch Church by the road through Cambridge, Ely, and Downham Market.

The present town is supposed to have existed before the Conquest. It has been supposed that there was in the Roman time a town on the spot where the village of West or Old Lynn now stands, on the western side of the river. Before the time of Henry III. the Ouse is supposed to have had its outfal at or near Wisbeach (Wis-beach, or Ouse-beach), the Little Ouse, with the Nare, and one or two other streams, having their outlet at Lynn; but the old channel of the Ouse having become obstructed, a new channel was opened into the bed of the Little Ouse, and the waters of the Greater Ouse were thus brought by Lynn. The harbour of Lynn was considerably enlarged by this alteration, the western bank of the river being to a considerable extent swept away, with one of the churches of Old Lynn, and perhaps the site of the original or Roman town. (Richards's *Hist. of Lynn.*) Lynn had been, previously to this, a place of considerable trade, and was especially favoured by King John, who granted it a charter of incorporation. It was subsequently patronised by Henry VIII., who emancipated the corporation from the feudal superiority of the bishops of Norwich, and changed the name of the town from Lynn Episcopi, Bishop's Lynn, to Lynn Regis, or King's Lynn. In the civil wars of Charles I. the town stood out for the king, but capitulated A.D. 1643, after a siege of three weeks, to the earl of Manchester, the parliamentary commander for the eastern associated counties. A conspiracy was formed soon afterwards to surprise the parliamentary garrison, but it was detected, and the projector (the well-known Sir Roger L'Estrange) was kept for some years in prison.

The town at present extends in length about a mile on the east bank of the river, and about half a mile in breadth. It is traversed or bounded by several narrow streams or 'fleets,' over which are many bridges. There is no bridge in the town over the Ouse, which is about as wide as the Thames at London Bridge; but there are bridges about a mile above the town over the Eau Brink, which is a modern cut, and the old channel of the Ouse; by which bridges there is communication with West Lynn as well as with Wisbeach and the Lincolnshire Fens. The town was formerly defended on the land side by walls, in which were nine bastions and three gates. One of the gates on the south side of the town remains, and there are a few fragments of the walls: the fosse, which was outside the walls, still encircles the town. On the north side of the town is St. Ann's Fort, a battery of heavy guns, intended to guard the passage of the river. The town is well paved and lighted, but not well supplied with water. The three principal streets are parallel to the river; smaller streets connect them or branch from them. The houses are chiefly old and inconvenient, except in the more modern parts of the town. The Tuesday market-place, in the northern part of the town, comprises an area of three acres, and is surrounded by some good houses. There is in it a market-cross, an octagonal building erected A.D. 1710, now in bad repair, having an Ionic peristyle rising to the first story, surmounted by an open gallery. The Saturday market is held in a convenient area near St. Margaret's Churchyard. There are also a cattle and a fish-market. The guildhall is an antient building of stone and flint, with court-rooms, assembly-rooms, &c. There is a borough gaol, but it is not sufficient for the proper classification of the prisoners. There are an exchange and a custom-house in one building, an excise-office, and a theatre, a modern building, well arranged and fitted up. The borough comprises the united parishes of St. Margaret and St. Nicholas, and the parish of All Saints in South Lynn. The church of St. Margaret is a cross church of spacious dimensions, which was once much larger. It contains portions of the early, decorated, and perpendicular styles of English architecture. The chancel or choir, which is early English, has a fine east window, and two octagonal turrets crowning the buttresses at the angles. There are two western towers, one of which formerly had a lofty spire, and there was formerly a lantern or tower at the intersection of the transept. The charnel-house, in the churchyard, was some years back used as a grammar-school, but a new school-house has been since built. The chapel of St. Nicholas is very large, being 194 feet long and 74 wide, inner dimensions. It consists of a lofty nave with side aisles, but without any transept or distinct choir: it is chiefly of decorated or perpendicular English architecture, with large east and west windows. It has a very rich south porch, and a fine wooden roof. It had a spire 170 feet high, which was blown down a century ago. All Saints' Church is also a cross church, but of smaller dimensions than St. Margaret: the tower, which fell down in 1763 and demolished part of the church, has not been rebuilt. Beside the churches there are the remains of some other ecclesiastical edifices. There is an hexagonal tower 90 feet high, a remain of the Grey (or Franciscan) Friars' monastery, which serves as a landmark to vessels entering the harbour. The chapel of our Lady of the Mount, or Red Mount Chapel, is on the east side of the town, and is remarkable for the beauty of its architecture: it is a small cross chapel of stone, and is erected on the walls of a more antient building of coarse red bricks, an irregular octagon, about 26 feet in diameter, with buttresses at the angles. St. James's Chapel was lately used as a workhouse. There are several dissenting meeting-houses in Lynn.

The population of the borough in 1831 was 13,370, of which a very small proportion was employed in agriculture or in manufacture properly so called. Rope and sail-cloth are the only manufactures, and of the latter but little is made. The trade of the place is however great. It is the port of that large portion of the midland counties which is watered by the Ouse. The harbour is shallow, and the channel by which it is approached from Lynn Deeps rather intricate. Some parts of this channel are not more than one foot deep at low-water in spring tides; and in following the channel from Lynn seawards, it is necessary to go at least five miles before reaching a depth of six feet. The banks on each side of the channel are then dry in some places to the height of ten or twelve feet. The 'deeps' are the deeper parts of the channel out to sea; they are ten or twelve miles below Lynn, following the course of the channel. (Commander Hewett's *Survey of Lynn and Boston Deeps.*) The exports are chiefly corn and agricultural produce, sent coastwise, and a fine white sand found near the town, and used in making glass.

quantity of shrimps, caught on the shores of the Wash, are sent to London. The imports are corn and coal; timber from America; timber, deals, hemp, and tallow from the Baltic; wine from France, Spain, and Portugal, &c. Formerly many ships were fitted out for the Greenland whale-fishery, but this branch of industry has been in a great degree given up. Ship-building is not carried on to the extent it formerly was. There is a corn-market on Tuesday, and a market for general commodities on Saturday. There are two yearly fairs.

The corporation under the Municipal Reform Act consists of six aldermen and eighteen councillors, one of whom is chosen mayor: by the same act the borough was divided into three wards. Lynn has sent two members to parliament ever since 23rd Edward I. The parliamentary constituency in 1833 consisted of 257 freemen and 608 ten-pound householders; together 865. The parliamentary and municipal boundaries coincide, and include an area of 2620 acres.

The living of St. Margaret is a perpetual curacy united with the perpetual curacy of St. Nicholas; their joint yearly value is 138*l.* All Saints is a vicarage, of the clear yearly value of 134*l.*, with a glebe-house. Both are in the archdeaconry of Norfolk and diocese of Norwich.

There are at Lynn an endowed grammar-school, national and Lancasterian schools, and several private schools; a mechanics' institute, a parochial library in St. Margaret's Church, and a public subscription library. There are four hospitals or almshouses, and many other charitable institutions.

LYNX. The name of *Lynxes* is applied by zoologists to a subdivision of the great genus *Felis*, or Cats, well marked externally, and elevated by Mr. Gray to the rank of a genus, under the appellation of *Lyncus*.

There does not appear to be any considerable difference between the organization of the Lynxes and that of the other Cats; but it is extremely probable that there is some modification about the bones of the tongue, and the organ of the voice generally, to produce the peculiarly powerful noise analogous to what is called 'spitting' and 'swearing' in the domestic cat.

Linnæus, in his last edition of the *Systema Naturæ*, records but one species, *Felis Lynx*, to which he assigns the woods and deserts of Europe and Canada as localities. This was probably the *European Lynx*, and the descriptions may have been founded on Lynxes from Canada as well as Europe.

Gmelin, in his edition, adds three other species, *Feles Chaus*, *Caracal*, and *rufa*; and gives two varieties of *Felis Lynx*, with Europe, America, Northern Asia, and even Japan, as the habitations.

Pennant notices seven species of Lynxes,—the *Mountain Lynx*, Cat-a-mountain of Ray (North America), the *Serval*, the *Lynx*, the *Bay Lynx*, the *Caspian Lynx*, the *Persian Lynx*, and the *Libyan Lynx*. He states that the third inhabits the vast forests of the north of Europe, Asia, and America; 'not India, though poets have harnessed them to the chariot of Bacchus, in his conquest of that country.' The fourth, he says, is an inhabitant of the inner parts of the province (now the State) of New York. To the fifth he assigns the 'reeds and woods in the marshy parts that border on the western sides of the Caspian Sea, particularly about the Castle Kislar, on the river Terek,' and the Persian provinces of Ghilan and Mazanderan; adding that it is frequent about the mouth of the Kur, the antient Cyrus. Persia, India, and Barbary are the countries which he states to be the localites of the sixth; and Libya and Barbary are mentioned by him as the countries of the seventh. It is doubtful what animals Pennant meant to designate under some of these names. The *Serval* is not considered to be a *Lynx*.

Cuvier observes that there are known in commerce, under the name of *Loups Cerviers* (Lupus cervarius), four or five sorts of Lynxes, which had long been confounded by naturalists, and whose specific limits were not perhaps well fixed when he wrote. We shall proceed to notice the arrangement of M. Temminck, and then return to observe what part of it is adopted by the Baron.

M. Temminck gives the following as species.—

Felis cervaria; described as nearly equalling a wolf in size, and possibly the *Kattlo* of Linnæus and the Swedes; but it has been remarked that no skins of it are contained in the cargoes that arrive from the Baltic. In commerce the skins of *F. cervaria* are said to be only obtained from the markets of Moscow, to which they are brought from the provinces of Asia. It is considered as probable that this species may have been confounded, under the name of the *Canadian Lynx*, with

2. *F. Borealis*, which is intermediate in size between the fox and the wolf. This comprehends the *Canadian* but not the *Mississippi Lynx* of Cuvier, and is said to inhabit the north of both the old and the new continents: its fur, less valuable than that of *F. cervaria*, is stated to be received equally from Sweden and from Hudson's Bay.

3. *F. Lynx* (true Lynx), different from, but nearly allied to, *F. cervaria*, *F. Borealis*, *F. rufa*, and

4. *F. pardina*. Size of a badger, but the legs longer, resembling *F. rufa* in form and size; tail short, but longer in proportion than that of *F. Lynx*. *F. pardina* is the *Loup Cervier* of Perrault, and is found only in the south of Europe, the centre being the locality of the true *Lynx*.*

5. *F. Caracal*; *Nubian Caracal*; and *Cat of the Desert* of Bruce; *Persian Cat* (*Lynx*) of Pennant.

6. *F. aurata*. Rather less than the Caracal. Country unknown. Skin purchased from a London dealer.

7. *F. Chaus* (Güldenstedt), figured by Schreber. The other animals described under this name are considered to be referrible to

8. *F. Caligata*; *Booted Lynx* of Bruce; *F. Libycus* (Olivier); *Libyan Caracal* of Buffon.

Of these Baron Cuvier notices *Felis cervaria* as the finest and largest; *Felis Borealis*; *Felis Lynx*, which has almost entirely disappeared from populous countries, but is still to be found in the Pyrenees, the mountains of the kingdom of Naples, and even, it is said, in Africa; *Felis pardina*, Oken, from the south of Europe; *Felis rufa*, Gülden.; and *Felis Chaus*, or *Lynx of the Marshes* of Caucasus, Persia and Egypt. Cuvier further observes that it is believed at present that the *Booted Lynx*, *Felis caligata*, Temm., may be distinguished from *Felis Chaus*; but he remarks that *F. caligata* is at least very nearly approximated to it, and that it has the same habits.

Felis Caracal (Persia, Turkey, &c.), which he considers to be the true Lynx of the antients, closes Cuvier's list of species; but he alludes in a note to *Lynx fasciatus*, *L. Floridanus*, and *L. montanus* of Rafinesque; and to *Felis aurata* of Temminck, as belonging to this tribe.

Mr. Gray places his genus *Lyncus* (subfamily *Felina*) between the genera *Felis*, Linn., and *Prionodon*, Horsf.

M. Lesson gives the following species:—1. *F. Lynx*, the '*Loup cervier* of the furriers, *Goupe* of the Norwegians, and *Wargelue* of the Swedes, who recognise three very different varieties of it.' He states that the whole of Europe is its habitat, where it has become very rare, and he says that they point out ('on indique') a pale variety, '*Felis rufa*, Pennant?' and that 'le capitaine Brooks en indique trois,' which may be, in his (the captain's) opinion, regarded as species. 2. *F. pardina*, Oken, Temm.; *Loup cervier* of the French Academicians; to this Portugal, Sardinia, Sicily and Turkey are assigned as localities. Next follows *Felis Serval*, which cannot be considered a Lynx. 3. *F. cervaria*, Temm. 4. *Felis Borealis* (Chat du Canada, Geoff.), to which the northern countries of America and Asia are given as its distribution. 5. *Felis Caracal*, the *Lynx* of the antients (Africa, Persia, and Arabia). M. Lesson describes the differences of the Caracals of Algiers, of Nubia, and of Bengal. 4. *F. Chrysothrix* and *F. aurata*, Temm.; country unknown. 5. *F. Chaus*, Gülden. (Egypt, Nubia, and Caucasus). 6. *Booted Lynx* (*F. caligata*, Bruce, Temm.; *F. Libycus*, Oliv.). To this a range is given from Egypt to the Cape of Good Hope in Africa, and the south of Asia. M. Lesson also notices as specifically different the *Felis Manul* of Pallas and Desmarest, a species not admitted by Temminck, but which has, according to Pallas, the appearance of the *Lynx*. (Mongolian Tartary.)

---

* With respect to *Felis Pardina*, Col. Sykes makes the following statement 'Although Temminck, in his "Monographie de Mammalogie," p. 116, in a note, says the skin of this European *Felis* is well known amongst the furriers as the Lynx of Portugal, I have nowhere been able to meet with a specimen in London; and as amongst my friends scarcely any one appeared to be aware of the existence of a Spanish Lynx, I thought it might be acceptable to the members to exhibit specimens in a state of maturity and nonage. In Andalusia, whence the specimens come, it is called *Gato clavo* (*clavo* meaning the pupil of the eye), illustrative of the spotted character of the skin. Some peasants in Andalusia make short jackets of the skins. The animal inhabits the Sierra Morena. I bought both skins at Seville for thirty reales, about 6*s.* 3*d.* Neither the British Museum nor the Zoological Society has specimens.

'Temminck describes the *Pardina* as "Toutes les parties du corps *lustre*, a peu près de la même teinte que dans le caracal." This is certainly not the description of my animal, the colour of the adult being reddish-gray, and that of the non-adult light fawn; nevertheless there are so many other points common to both, that it would be unadvisable to consider them distinct.' (*Zool. Proc.*, 1838.

Sir William Jardine ('Naturalist's Library,' Mammalia, vol. ii., 1834), who adopts the genus *Lyncus* or *Lynchus* of Mr. Gray, as the fifth genus of the *Felinæ*, enumerates the following species: *Lynchus Caracal*; *L. aurata*; *L. Chelidogaster*, inhabits Chili (Temm., Mus. Leyd.); *L. caligata*, Bruce; *L. nigripes*, Burchell, inhabits South Africa; *L. Chaus* (Gülden., Rüpp.); *L. Canadensis*; *L. rufa*, Bay Lynx, inhabits banks of Colombia river, United States, not Canada (Temm.); *L. fasciata*, Banded Lynx (Richardson), inhabits N. America, woody countries in the neighbourhood of the Pacific (Lewis and Clark); and *L. Lynx*.*

Sir William Jardine remarks that there is yet considerable confusion among the Lynxes of America, and that, except the Canada Lynx, the species are perhaps not well determined. He observes that Mr. Vigors and Dr. Horsfield describe one under the title of *F. maculata* from Mexico.

Sir William further states that another Asiatic Lynx may be perhaps added in the *Felis affinis* of Mr. Gray, figured in his 'Illustr. of Indian Zoology.'

It may be necessary also to call the reader's attention to two species of *Felis*, one in the volume of the 'Naturalist's Library,' *F. Servalina*, figured as *F. ornata*, which Sir W. Jardine at first considered as identical with Mr. Gray's species with the last-mentioned name, but which Mr. Gray considered to be distinct. The figures of both *F. ornata*, Gray ('Illustr. Ind. Zool.'), and *F. servalina*, Jardine, have small tufts on the tips of their ears, and are otherwise inclined to be lynx-like; as if they formed the passage between some of the smaller Spotted Cats and the Lynxes.

Mr. Swainson ('Natural Hist. and Classification of Quadrupeds,' 1835) having compared the two typical forms of the *Feræ* and *Raptores*, observes that it remains to be ascertained which group among the *Feræ* may be likened to the *Owls*, and he fixes upon the *Lynxes*, because *Lynxes* and *Owls* are both nocturnal animals, both have short tails and comparatively large heads; and because the *Owls* 'are particularly remarkable for certain appendages or tufts which rise above their ears,' whilst in the *Lynxes* the 'ears are long, and from the tip of each arises a tuft of lengthened hairs, perfectly analogous to the tufts of lengthened feathers on the horned *Owls*, the most typical birds of the family of *Strigidæ*.' His only notice of *Lynx* in the 'Classification' at the end of the volume is '*Lynx* Antiq., ears tufted with hairs, tail short;' and it appears as the fifth and last subgenus of *Felis*, Linn., the other four being,—1. 'Leo Antiquorum, *Lions*, head and neck furnished with a mane of long hair, tail tufted. 2. *Felis*, *L. Cats*, no main, tail long, not tufted. 3. Cynailurus, Wag., *Hunting Leopards*, claws semi-retractile; and, 4. Prionodon, Horsf., affinities uncertain.'

The *Lynxes* may be divided into two groups: the first consisting of those species whose bodies are comparatively slender, and whose tails and tufted ears are comparatively long; the second of those whose bodies are thicker and stout, and whose ears and tail are comparatively short. The *Caracal* is an example of the first subdivision; and the *European* and the *Canada* Lynxes of the second. Sir Wm. Jardine considers the tufts of hair at the tips of the ears as somewhat inconstant, and only present in spring, or at the commencement of the breeding season, like those adorning the ears of many squirrels.

It is evident that much doubt still hangs about many of the species, and we shall endeavour to lay before the reader some of those forms which are most free from uncertainty.

LYNXES OF THE OLD CONTINENT.

As examples of the Lynxes of the Old World we select the following species:—

The Caracal. M. Temminck describes this species (*Felis Caracal*), which is the *Siyah Ghush* or *Black-ear* of Charleton and others, as having a pale reddish-brown fur with a vinous tinge, the red becoming paler as it reaches the lower parts. Two spots of pure white above the eyes, the uppermost on the inner side of the eye, the lower at its external angle. Termination and edges of the upper lip, chin, breast, belly, and insides of the legs pure white; parts whence the whiskers spring, black; back of the ears at the base, deep black, more grey towards the tips, which are tufted with long black hairs. Length, 2 feet 10 inches, of which the tail measures 10: average height about 14 inches.

Mr. Bennett (*Tower Menagerie*) describes the Caracal as larger than the Fox, and the whole of the upper surface of the body as of a deep and uniform brown, the hairs being for the most part slightly tipped with grey; the under and inner parts nearly white; and the chin, lower lip, and two spots, one on the inner side of and above the eye, and the other beneath its outer angle, completely white; neck and throat of a lighter and brighter brown than the rest of the fur; the ears long and upright, tapering gradually to a fine tip, surmounted by a pencil of long black hairs, and black externally and whitish within; whiskers short, taking their origin from a series of black lines which occupy the sides of the muzzle; at some distance behind them, in front of the neck on each side, a short and thick tuft of lighter coloured hairs; tail eight or nine inches long, of the same uniform colour with the body from base to tip.

The description of Mr. Bennett is very good, and so is that of M. Temminck. Slight variations of colour as to the hue depend most probably on sex, age, and locality. There are three or four specimens now living in the Gardens of the Zoological Society of London (Regent's Park). The finest of these, now in very fine condition, was brought over with the Giraffes.

Geographical Distribution.—Persia, India, Barbary (Pennant); Persia, Turkey, &c. (Cuvier); the whole of Africa from Egypt and Barbary to the extremity of Caffraria, and the southern half of Asia, at least as far eastward as the Ganges (Bennett). N.B., the specimen from which Mr. Bennett took his description is noticed by him as a native of Bengal, and he observes that there is no difference of any importance between it and the African variety. Cuvier, to whom M. Duvaucel sent drawings of the animal from Calcutta, was convinced that this is the case. He refers to the *Caracal à longue queue* of Buffon's Supplement, iii., pl. [illegible], and observes there is no difference between that and the others, and that the first Caracal of Buffon had a mutilated tail. Africa, Arabia, Persia (Fischer); Africa, Persia, Arabia (Lesson); Southern India and Africa (Jardine).

Habits, Food, &c.—This species is said to follow the lion and other large beasts of prey, most probably for the purpose of feeding upon what they leave. But in addition to this it feeds on small quadrupeds and birds, the latter of which it is said to pursue actively on trees. It has obtained the name of lion's provider, most probably from its dogging the footsteps of the lion and having been found preying upon the carcasses which the former has left. According to M. Temminck, the Caracals hunt in packs like the wild dogs, and so run down their prey. Pennant, quoting Thévénot, notices their feeding on the remains of the prey which the lion leaves, and seems to confirm the account given by M. Temminck, for he states that they are often brought up tame, and used in the chace of lesser quadrupeds and the larger sorts of birds, such as cranes, pelicans, peacocks, &c.: when they seize their prey, they hold it fast with their mouth and lie motionless on it. Pennant, quoting Hyde, also states that the Arabian writers, who call it *Anak el Ard*, say that it hunts like the panther, jumps up at cranes as they fly, and covers its steps when hunting. In captivity the Caracal is generally very ill-natured and irritable, and does not seem to hold out much promise for domestication; but we are aware that it is not safe to come to conclusions of this sort upon the evidence of an unhappy irritable animal shut up in a cage, where nature intended it for unlimited roamings. Since the above was written, we have seen a young Caracal in the Garden of the Zoological Society at the Regent's Park, that might be rendered very tame with a little attention. It was already familiar, anxious to be noticed, pleased with being caressed, and playful as a kitten. Dr. Charleton however gives evidence of the fierceness and strength of this species, for he relates that he saw one fall on a hound, which it killed and tore to pieces in a moment, though the dog defended itself to the utmost.

This animal derives its name of *Caracal* from the Turkish words *kara*, black, and *kulach*, ear; and the Persian name *Siyah Gush* or *Sia-gusch* (*sia*, black, and *gusch*, ear) is derived from the same characteristic markings.

Authors seem to concur in holding that this is the [illegible]

---

* In the article LION, vol. xiv., p. 36, in the enumeration of the species of Puma adopted by Sir William Jardine, the word 'Pajeros' has been interpolated between 'P.' and 'chalybeata,' and 'P. Yaguarundi' is omitted. The correct list, as given by Sir William, is, 'P. concolor, P. nigra, P. Yaguarundi, P. [illegible], P. Pajeros, P.? chalybeata.' Figures of Felis Yagouaroundi and Felis [illegible] given in 'The Zoology of the Voyage of H.M.S. Beagle,' edited [illegible] and published with the approval of the Lords Commissioners [illegible], now in course of publication.

Lynx, of the antients, and though we lean strongly to this opinion, the reader should bear in mind that the latter evidently used the term to denote various animals, as Gesner well remarked. The 'lynces Bacchi variæ' of Virgil (*Georg.*, iii. 264) and the skin 'maculosæ lyncis,'* alluded to by the same author (*Æneid.*, i. 323), can hardly be held to apply to the *Caracal*, though Ovid's line (*Met.*, xv. 413)

'Victa racemifero lyncas dedit India Baccho'

may. The truth seems to be that the antients themselves had no very precise ideas of the animal which was accorded to Bacchus as one of his attributes. The terms Lynx, Panther, and Tiger seem to be all employed to designate this animal or these animals; and if we refer to gems or coins or other antient monuments, the *Lynces*, to play somewhat unpardonably perhaps on Virgil's expression, will be found to be sufficiently *variæ*. The animals represented on the antient sculptures have generally the round ear of the Lion, Tiger, and Panther or Leopard; and their general contour is that of the Lion, Lioness, or Panther, and Leopard. See, for instance, No. 30, No. 37, in Room i; Fragments of Terracottas in Room x.; No. 8 (Bacchus and Ampelus), Room iv.; No. 40 (Libera, or Female Bacchus), Room vi.; No. 12, Room iii.; and No. 7, Room ii., of the Townley Gallery in the British Museum; and the publication by the Society for the Diffusion of Useful Knowledge, 'British Museum: Townley Gallery,' vol. i. and ii. The Lion's skin, with which, as well as that of the Panther and Roe, he was represented, appears on the colossal statue of Bacchus in the Elgin collection in the British Museum.† In the edition of the *Gemmæ et Sculpturæ Antiquæ*, by Gronovius, we find in the 'Carro di Baccho,' alluded to in the article LEOPARDS, a child in a chariot driving two round-eared spotted great cats: and, in the next gem figured, 'Tigre di Bacho,' also a cornelian, we have a round-eared spotless female great cat with a tuft at the end of the tail, which no Panther, Leopard, or Lynx possesses.

In the coin of Septimius Severus, noticed in Captain Smyth's 'Catalogue,' between the figures‡ is a Lynx or Panther, illustrating the verse of Propertius:—

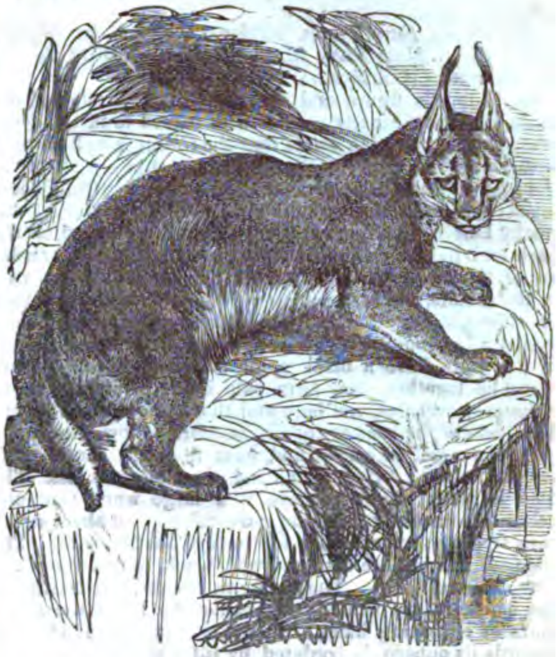
'Lyncibus ad cœlum vecta Ariadne tuis.'

Nor does there occur to us any antient statue, gem, or coin whereon the 'Lynx' of Bacchus is represented with pointed ears tufted at the summit, the characteristic mark of that subdivision of the cats denominated *Lynxes* by modern zoologists; though we by no means feel sufficient reliance upon our limited experience to consider this negative evidence as conclusive. The animal in the Palestrine Mosaic, with the word 'Lynx' below it, is represented with a tail of considerable length, and cannot be mistaken for one of the animals now called Lynxes; indeed, if we do not err, the Abbé Barthélemi observes that this animal bears a strong resemblance to a horse.

That the Λύγξ of Aristotle, Ælian, and Oppian was not one of the doubtful animals above alluded to, but one of the Lynxes of modern zoologists, there can be, in our opinion, no doubt.

Ælian (xiv. 6) gives such a description of his Lynxes, with the tips of their ears tufted, their leaping on their prey, and their tenacity in holding it, as cannot be mistaken; and he quotes two lines of Euripides, to show that the animal which he is describing is the Lynx of that poet. Oppian (*Cyneget.*, iii., v. 84) also gives such an account of his Lynxes as can be referrible to no other animals than those on which we are treating. He speaks of two kinds, notices heir preying on hares, and leaping upon stags and oryxes.

Pennant conceived that the European Lynx was the Λύγξ of Ælian and Oppian, and the *Chaus* of Pliny; with regard to the former, we think, without due consideration. The *Caracal* comes much more within Oppian's description than the European Lynx. Oppian expressly notices the ruddy and the yellow colours of his two kinds, but mentions no spots. The localities of the *Caracal*, combined with the other evidence, make it much more probable that it should be the animal designated as a Λύγξ by Aristotle and Ælian, and one, at least, of the two kinds mentioned by Oppian, if his differences were not, as they well might be, those of climate, sex, or age. Mr. Bennett ('Tower Menagerie') thinks that the *Caracal* is unquestionably identical with the 'Lynx' of the antients, though the name has been usurped in modern times for an animal of northern origin, utterly unknown to the Greeks, and known to the Romans by a totally different appellation.



The Caracal.

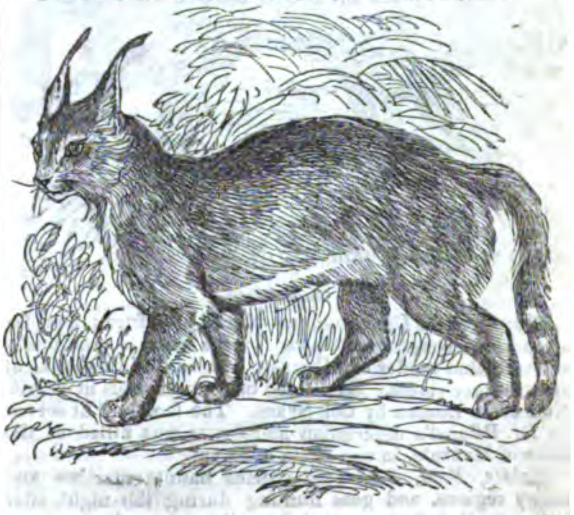
The Booted Lynx, *Felis caligata*, Bruce, Temm.; *F. Libycus*, Olivier; *F. Chaus*, Thunb., Geoff. (part); *Lynx des Marais* (part), Cuv. (Fischer).

Description.—Small, total length about three feet, of which the slender tail measures rather more than one-third, or thirteen inches and a half; ears large, red within, tipped with a pencil of brown short hairs; sole and posterior part of the foot (leg, in common parlance) deep black; upper parts of the body bluish grey, in some specimens fulvous, clouded with grey and sprinkled with black hairs; lower parts, including the under parts of the neck and breast, reddish; thighs marked with indistinct bands of rather bright brown; two rather bright ruddy bands on the cheeks; tail at its base colour of the back, black at the tip, and with three or four incomplete rings above it, which rings are separated by intervals of a more or less pure white.

The *Female* has, generally, the tints more yellow.

The *Young* have well-defined dark bands upon their sides.

Geographical Distribution.—Africa, from Egypt and Barbary to the Cape of Good Hope; the south of India.



The Booted Lynx.

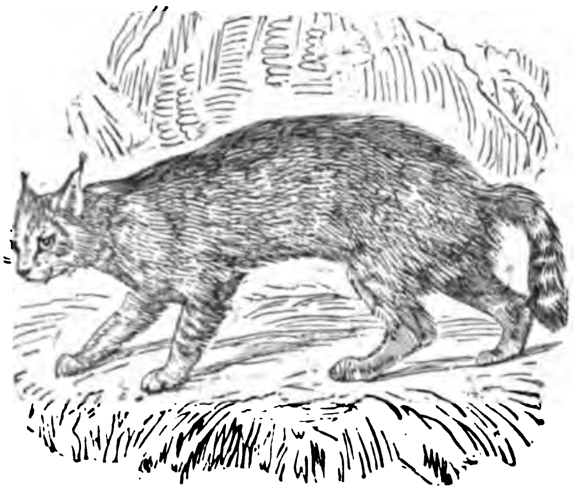
† See 'Library of Entertaining Knowledge:—British Museum—Elgin and Phigaleian Marbles,' vol. ii.

Hercules and Bacchus.

Food, Habits, &c.—The *Booted Lynx* preys upon birds and small quadrupeds; of the former the Guinea-fowl is much sought after by the African varieties. Like others of the subdivision, it will make a good meal on carrion, and feast on the remains of larger quadrupeds which have fallen before the great beasts of prey.

The Chaus, Felis Chaus, Güldenst.; *Lynx des Marais* (part), Cuv.; *Mota Rahn Manjur*, or *Larger Wild Cat*, of the Mahrattas (Col. Sykes).

Dr. Rüppel's figure and description have dissipated the confusion that formerly reigned with regard to this and the preceding species. He states that the *Chaus* is well covered with hair all over, and of this covering that which forms the ground-work is woolly, very soft, and plentifully developed; the hairs are not thickly set. The colour of the woolly hair is of a dirty palish ochre-yellow, darker on the back and lighter on the under parts; the hairs or bristles are of the same colour at bottom, have a dark-brown ring in the middle, and at the tip are of a greyish yellow, whitish, or saffron-colour; so that the appearance produced is a mixed colouring of greyish yellow and dirty white. Many of the hairs have a black point, and on the sides, where many lie together, they form pale black perpendicular or oblique spiral lines, and here and there single black points. The hairs of the back are of a light ochre-yellow, with points almost of a saffron colour, and form from the shoulders to the tail a yellow stripe, which is darkest on the cross. The nose is black; above the eye is a large white spot, and below it a smaller one of the same colour A black streak runs from the inner corner of the eye to the nose. The edges of the lips are bordered with black, and a fine white ring encircles them. The eyebrows, cheeks, and bristles of the whiskers are white, and among the latter are a few hairs of a shining black. The inner surface of the ear, towards its outside, is bordered by tufts of hair which are white and yellow; the back of the ear is grey brown, and the tips are brown with terminating black tufts, half an inch in length; the cheeks, lower jaw, throat, neck, and chest are ochreous yellow, and the belly inclines to whitish yellow with darker spots. Externally the anterior and posterior extremities are of the general colour down to the ankles (which are dirty ochreous yellow and black behind), and barred with four or more black transverse bands. The inside of the limbs is yellowish, and there is a large round black spot on the fore-legs. The tail is about one-fourth as long as the body, of a greyish colour, blunt and black at the point, towards which are two black rings between two greyish white ones; but neither of these is very distinct. (Rüppel.)



The Chaus (Rüppe.).

Geographical Distribution.—North of Africa; how far up the Nile is not ascertained. In the morasses and bushy lowlands that border the Caspian Sea, and on the banks of its tributary rivers. Said to be more numerous in Persia. Noticed in Deccan by Col. Sykes. The female that served for Dr. Rüppel's description and figure was killed at the Lake of Menzale, in the Delta of Egypt.

Habits, Food, &c.—This species haunts marshes and boggy regions, and goes hunting during the night after birds, small rodents, and fishes; it seldom climbs trees, and is not easily tamed. (Rüppel.

The *Chaus* of Pliny (*Nat. Hist.*, viii. 19), which the Gauls called Raphius, with the figure of a wolf and the spots of a pard, first shown at Pompey's games, can hardly, we think, have been this animal.

European Lynxes.

The European Lynx. Felis Lynx, Linn.; *Le Lynx*, Buff.—Fur long, of a dull reddish grey above, with oblong spots of reddish grey upon the sides, the spots on the limbs rounder and smaller; whitish below, mottled with black. Length about three feet.

This species varies much. In winter the fur is much longer than it is in the summer, and has a hoary appearance in the former season, owing to the long hair being then tipped with greyish white. The tail, which is black at the end, is short, not more than six or seven inches long.

Geographical Distribution.—Some authors confine the locality of this species to Europe; others are of opinion that it increases in numbers as it approaches the borders of Asia, which it also inhabits, and abundantly. France is considered its most northern range. It does not seem to be quite clear that *Felis cervaria* of Temminck is not a variety of this species. But *F. cervaria* inhabits the north of Asia, and skins are sent from Moscow. This is supposed to be the *Kattlo* of the Swedes by some, while others consider *F. Lynx* to be the *Goupe* of the Norwegians and the *Wargelue* of the Swedes. If these differences should prove to be well founded, it may be that there are two European species, or at least varieties, one inhabiting southern Europe not higher than France and the warm parts of Asia, and the other inhabiting the north of Europe and Asia.

Habits, Food, &c.—The European Lynx feeds upon small quadrupeds and birds, in search of which it often climbs trees.

This species is supposed by many to be the *Lupus cervarius* of Pliny (*Nat. Hist.*, viii. 22) and the *Chaus* (viii. 19) above alluded to. Both are spoken of as shown in the arena by Pompey, and as coming from Gaul. Dr. Fischer, who is of this opinion, supposes it also to be the *Lynx* mentioned by Pliny in his chapter 'De Unguibus' (viii. 46).

European Lynx.

The European and northern Asiatic Lynxes and the Canadian Lynx produce the great supply of furs known to the furriers under the name of lynx. The colder the climate the fuller and the more valuable is the fur.

American Lynxes.

We select as our example the

Canada Lynx, Felis Canadensis (Geoff.). Dr. Richardson ('Fauna Boreali Americana') states that the early French writers on Canada, who ascribed to this species the habit of dropping from trees on the backs of deer, and destroying them by tearing their throats and drinking their

Sagard, gave it the name of *Loup Cervier*. The French Canadians, he adds, now term it indifferently *Le Chat*, or *Le Peeshoo*. He remarks that the mistake of Charlevoix in applying to it the appellation of Carcajou, which is proper to the wolverene, has produced some confusion of synonymes amongst subsequent writers. Other writers however consider that Charlevoix intended to designate the Puma by the name of Carcajou, though he used the term improperly. If the following be the passage alluded to, it can hardly be applied to the Canadian Lynx—'The elk has other enemies besides the Indians, and who carry on full as cruel a war against him. The most terrible of all these is the Carcajou, or Quincajou, a kind of cat with a tail so long that he twists it several times round its body, and with a skin of a brownish red. As soon as this hunter comes up with the elk he leaps upon him, and fastens upon his neck, about which he twists his long tail, and then cuts his jugular.' *Voy. Sep.* (*Letter* vii.) Now though there may be a little exaggeration about the length of the tail, and the use which the animal makes of it, the description is generally applicable to the Puma, and not to the Lynx, which has a mere stump of a tail, whilst the Puma has a remarkably long one. [OUNCE; LIONS, vol. xiv., p. 26.]

Description.—As there is some question about this species—for Pennant notices it as identical with the European Lynx, and M. Temminck describes the species as the same in both hemispheres, under the name of Felis borealis, whilst M. Geoffroy has named it as a distinct species—we shall give the description of Dr. Richardson, who adopts M. Geoffroy's name, at length.

'The *head* is round, the nose obtuse, and the face has much of the form of that of the domestic cat, but the facial line is more convex between the eyes. The *ears* are erect, triangular, and tipped by an upright slender tuft of coarse black hairs; they are placed about their own breadth apart, and on their posterior surface they have a dark mark beneath the tip, which is continued near both margins downwards towards their base. On the *body* and *extremities* the fur is hoary, most of the hairs being tipped with white; on the crown of the head and for a broad space down the middle of the back there is a considerable mixture of blackish brown, and on the sides and legs of pale wood-brown. In some specimens these colours produce an indistinct mottling; but in general there are no defined markings. A rufous tinge is also occasionally present about the nape of the neck, and on the posterior parts of the thigh. The *tail* is coloured like the back, except the tip, which is black. The *fur* is close and fine on the back, longer and paler on the belly. When blown aside it shows on the middle of the back a dark liver-brown colour from the roots to near the tip, but on the sides it is for the greatest part of its length of a pale yellowish-brown, being merely a little darker near the roots. The *legs* are thick, the toes very thick and furry, and are armed with very sharp awl-shaped white claws, shorter than the fur. There are four toes on each foot, those on the hind foot being rather the largest, but both feet have much spread. Length three feet one inch.' &c.

Dr. Richardson gives the following synonymes, &c.:—*Loup cervier* (Anasiquou) Sagard. Theodat.; *Loup-cervier, or Lynx*, Dobbs; *Cat Lynx*, Penn., 'Arct. Zool.;' *Cat*, or *Peshu*, Hutchins; *Lynx, or Wild Cat*, Hearne, Mackenzie; *Felis Canadensis*, Geoff., 'Ann. du Mus.,' Sabine, Franklin's 'Journ.;' 'Zoological Museum,' No. 72; *Peeshoo*, Cree Indians and Canadian Voyagers.

Geographical Range.—The only species of the genus existing north of the Great Lakes, and eastward of the Rocky Mountains. Rare on the sea-coast; does not frequent the Barren Grounds, but is not uncommon in the woody districts of the interior. Found on the Mackenzie River as far north as 66°. (Richardson.)

Habits, Food, &c.—Timid, incapable of attacking any of the larger quadrupeds, but well armed for the capture of the American hare, its principal prey. 'Its large paws, slender loins, and long but thick hind legs, with large buttocks, scarcely relieved by a short thick tail, give it an awkward clumsy appearance. It makes a poor fight when it is surprised by a hunter in a tree; for though it spits like a cat and sets its hair up, it is easily destroyed by a blow on the back with a slender stick, and it never attacks a man. Its gait is by bounds, straight forward, with the back a little arched, and lighting on all the feet at once. It swims well, and will cross the arm of a lake two miles wide;* but it is not swift on land. It breeds once a year, and has two young at a time.' (Richardson.)

Utility to Man.—The skin of the Canada Lynx forms a considerable article in the fur trade; the annual importation by the Hudson's Bay Company is stated at from seven to nine thousand. Dr. Richardson says that the natives eat its flesh, which is white and tender, but rather flavourless, much resembling that of the American hare.

The Canada Lynx.

Those who would wish to read of the fabulous qualities gravely attributed to the quick-sighted lynxes, and the use of some of their parts in the antient 'Pharmacopœia,' may consult Pliny, *Nat. Hist.*, viii. 38; xxviii. 8; and Ovid, *Met.*, xv. 413. See also the article BELEMNITE.

LYNX, a constellation of Hevelius, situated directly in front of Ursa Major, the head of the animal being half way between α Ursæ Majoris and Capella. Its principal stars are as follows:—

LYON, or LION, a city in France, formerly the capital of the district of Lyonais, now of the department of Rhône, situated at the confluence of the Rhône and the Saône, in 45° 46′ N. lat., and 4° 50′ E. long.; 240 miles in a direct line south-east of Paris; 286 miles by the road through Sens, Auxerre, Autun, and Châlons sur Saône; 288 through Fontainebleau, Nevers, Moulins, and Roanne; and 303 by Troyes, Dijon, and Châlons sur Saône.

The common opinion is that Lyon was founded by L. Munatius Plancus, commander of the legions in Gaul at the time of Julius Cæsar's death, who settled here the people of Vienna (Vienne), who had been driven from their own home by a revolt of the Allobroges, about 42 B.C. It seems improbable however that a situation so advantageous should have been entirely neglected by the Gauls; and the Celtic name given to the place, Lugudunum or Lugdunum (a name common to two other towns, Lugdunum Batavorum, now Leyden, and Lugdunum Convenarum, now St.

---

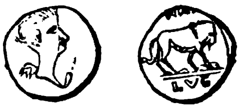
* In reference to the allegation that Charlevoix refers to this animal when he uses the term Carcajou, we may remark that in the continuation of his account he describes the Elk as fleeing to the water the moment he is attacked; for 'the Carcajou, who cannot endure the water, quits his hold immediately; but if the water happen to be at too great a distance, he will destroy the elk before he reaches it.'

Bertrand de Comminges), prevents our ascribing its origin wholly to Plancus.

Cæsar does not mention Lugdunum, which has furnished one of the reasons for denying to the town any higher antiquity than the time of Plancus; but the reason seems altogether insufficient.

Almost thirty years after the settlement of the Viennese, Plancus established at Lugdunum a Roman colony, or rather a municipium; such at least is the opinion of Father Menestrier, the Jesuit, in his erudite history of Lyon: others make the settlement of the Viennese and of the Roman colony to have been simultaneous.

Augustus was in Gaul about the time when Plancus is supposed to have established his colony, and appears to have made Lugdunum his place of residence for some time, an indication of the rising importance of the place. Strabo, writing a few years after, describes it as the most populous city of Gaul, except Narbonne (iv. 192, *Casaub.*). It was the great mart of the Romans, who had, even at that early time, a mint for coining gold and silver money, and it gave name to one of the four great divisions of Gaul. An altar was erected here by sixty of the nations of Gaul, by common consent, in honour of Augustus.



Coin of Lyon.
British Museum. Actual size. Silver.

Both Tiberius and Caligula appear to have favoured the town. The latter visited it, and instituted games professedly in honour of Augustus, about A.D. 40. The emperor Claudius, himself a native of Lyon, raised it from the rank of a municipium to that of a colony, in the strictest sense of the term, and regulated its local government. But its greatness received soon after a terrible blow; it was utterly destroyed in a single night by fire, originating, it has been conjectured, from lightning, about A.D. 59, according to some, but according to other calculations, about A.D. 64 or 65. The rebuilding of the city was promoted by a grant from the emperor Nero, to whom the citizens manifested their affection and fidelity in his downfal. Upon Vitellius assuming the imperial purple, they embraced his cause; and he stayed some time at Lugdunum on his way from the Rhenish provinces to Rome. Domitian, afterwards emperor, came to this city on the overthrow of Vitellius, to establish the authority of his father Vespasian in Gaul.

In the contest of Clodius Albinus with Septimius Severus Lugdunum became the scene of contest. In an engagement near this town Albinus was totally defeated and slain (A.D. 197). Lugdunum, which had afforded a retreat to the vanquished, was pillaged by the victor, who put most of the inhabitants to the sword, and burned the town, which Herodian describes as being then large and wealthy. In the reign of Probus, Proculus was elected emperor by the people of Lugdunum, who had been ill-treated by Aurelian, and were fearful of the severity of Probus. The latter however defeated Proculus, and caused him to be put to death (A.D. 280).

The usurper Magnentius, having been defeated by Constantius, sole survivor of the sons of Constantine, took refuge in Lugdunum, but was seized by the townsmen, who thus made their peace with Constantius (A.D. 353). Magnentius slew himself to avoid being delivered up. While Julian held the government of Gaul under Constantius, the environs of Lugdunum were ravaged, and the town nearly captured by the Allemanni. The emperor Gratian, pursued by the usurper Maximus, was overtaken and slain at Lugdunum (A.D. 383). In the beginning of the fifth century, in the reigns of Honorius and his successors, the Burgundians seem to have possessed themselves of this town and of the south-eastern part of Gaul, under the sanction of the emperors, who employed them to oppose other barbarians of a fiercer character. [BURGUNDIANS.] On the overthrow of the Burgundian kingdom, Lugdunum came into the power of the Franks.

Lugdunum, during the Roman period, occupies a consider- place in ecclesiastical as well as in civil history. The l had been early introduced into this part of Gaul, re a severe persecution raged in the reign of Marcus Aurelius Antoninus (A.D. 172 or 177). The churches at Vienna (Vienne) and Lugdunum sent a relation of their sufferings to those of Asia and Phrygia. This account, ascribed by some to Irenæus, 'is written with simplicity and beauty, and is one of the most affecting passages in the antient history of Christianity.' (*Hist. of the Church*, in *Library of Useful Knowledge*.) Pothinus, bishop of Lyon, and perhaps the person who introduced the Gospel into these regions, was one of the martyrs in this persecution. His successor was Irenæus, one of the most eminent of the early Fathers.

In the division of the Frankish kingdom under the Merovingian princes, Lyon, as we may now call it, was included in the kingdom of Bourgogne or Burgundy (A.D. 561-61[illegible]); but the city was depopulated by a fearful pestilence, and the troubles of the period and the rise of Châlons, which became a royal residence, were unfavourable to it. In the division of the Frankish empire among the grandchildren of Charlemagne (A.D. 843), Lyon, with the district of Lyonais, fell to the lot of the emperor Lothaire, and in the subsequent division of his states (A.D. 855) it fell to Charles, king of Provence, who made it his usual residence. On his death (A.D. 863) it was seized by Charles le Chauve, king of France. On the re-establishment of the kingdom of Bourgogne by Boson (A.D. 879) Lyon was included in his dominions. In the troubled period of the later Carlovingian kings of France, Lyon was subject alternately to that kingdom and to the kingdom of Bourgogne Transjurane. It was in these troubled times that the counts or governors of Lyon succeeded in establishing an hereditary sway, not over the city of Lyon so much as over the districts of Lyonais, Forez, and Beaujolais.

From about A.D. 955, Lyon was under the kings of Bourgogne Transjurane, and, upon the union of that kingdom with the Germanic empire, A.D. 1032, it became part of the domains of the emperors. Under the kings of Bourgogne the counts of Lyonais exercised the functions of government. The city was not however considered as a part of their hereditary fief; and in the reign of Rodolph III., surnamed Le Fainéant, Bruchard his brother, archbishop of Lyon, obtained the lordship of the city, which appears to have remained annexed to the see. The emperor Frederick Barbarossa (A.D. 1157) confirmed the temporal jurisdiction of the archbishops, extended it over all that part of their diocese which was in the kingdom of Bourgogne (*i.e.* on the east of the Rhône and Saône), and made them princes of the empire. The archbishops received the title of exarch: they were allowed free and independent jurisdiction, except so far as they were subject to the supreme authority of the emperor and the general laws of the empire. This grant excited the jealousy of the then count of Forez, and stirred up a war between him and the archbishop. Soon after this time Pierre Waldus, or Waldensis, one of the reformers of the church in the dark ages, lived and preached at Lyon.

At Lyon was held, A.D. 1245, the thirteenth general council, in which the pope Innocent IV. pronounced sentence of excommunication and deposition against the emperor Frederick II., on the ground of sacrilege and heresy. A new crusade for the recovery of the Holy Land was agreed upon, and it was determined to render aid to the emperor Baudouin, or Baldwin II. of Constantinople.

The citizens of Lyon appear at this time to have formed a powerful body. There was considerable trade carried on, and many Italian and Swiss families settled here. They were by no means satisfied with the government of their ecclesiastical rulers. Learning that Philippe II., Auguste, had established or extended the power of the municipality of Paris, they determined (in the early part of the thirteenth century) to elect a municipal body, which accordingly they did. The differences between them and the archbishop and chapter led at last to open hostilities; and the king of France (St. Louis) being one of the arbitrators appealed to in order to heal these disorders, his successors managed to bring the city under the dominion of the French crown. Philippe IV., Le Bel, received the citizens of Lyon under his especial safeguard and protection. The archbishops struggled stoutly for their rights; but in the reign of Philippe V., Le Long, the regal authority was firmly established.

In the year 1274 another general council was held at Lyon: at which the Greek church was professedly united to the Latin church, and several other important affairs brought under notice.

The remoteness of Lyon from the centre of the German empire, and the other more pressing occupations of the emperors, prevented them from interfering in the contest between the citizens of Lyon and their ecclesiastical governors, and the withdrawal of the city from the imperial government and its annexation to France took place with scarcely any opposition from the emperors. The political authority and a portion of the judicial authority were in the hands of the kings of France, and were exercised for them by officers appointed with the title of gardiateurs; by the baillis of Mâcon, who were seneschals of Lyon; and subsequently by the governors of the province of Lyonais. A portion of the judicial administration remained in the hands of the archbishops, and another portion in the hands of the municipality (or consulate, as it was termed), which constituted, down to the last century, a tribunal distinguished by its upright and enlightened decisions. Lyon continued to increase in population, wealth, and commerce. Its institutions were free; the citizens elected their own magistrates, controlled the receipts and expenditure of the municipality, and were exempt from the jurisdiction of any courts except those established in the city.

In the year 1362 Jacques of Bourbon, count of Maine, and his son Pierre, with several other nobles, were defeated and mortally wounded near Lyon by the 'free companies' who were at that time ravaging France. In the contest carried on with these marauders, the aqueducts which had conveyed water to the Roman Lugdunum, and the Roman bridge of Francheville, were ruined.

In the religious dissensions of the sixteenth century, Lyon suffered much at the hands of the Huguenots; but recovered its prosperity in the seventeenth and eighteenth centuries. The execution of Cinq Mars and De Thou, beheaded by order of Richelieu, A.D. 1642, took place in this city.

In the year 1793, during the government of the convention, the people of Lyon rose against the tyranny of the revolutionary club which had been established in the city; and seizing the Hôtel de Ville (or town-hall), condemned Challier, president of the club, whom they had captured, and put him to death. The population of Lyon in 1788 has been estimated at 180,000: other accounts make it to have been only 121,000 in 1791. It is likely that the troubles of the Revolution had diminished the prosperity, and with it the population of the city, but the great difference in the two statements makes it likely that one comprehended a larger portion of the environs than the other. Against this great city, the Convention sent an army of 60,000 men with a hundred pieces of cannon. The townsmen determined on resistance: 10,000 men engaged in the defence under the count of Précy, women and children caught the spirit of resistance, and the wealthy merchants and landowners devoted their fortunes to the providing of necessaries. The town was bombarded, and, though several successful sallies were made, was obliged, after a siege of sixty-six days, to yield to famine and force. The chief defenders quitted the place and retired towards Savoy, but were overtaken, and cut to pieces or dispersed by the hostile cavalry: about fifty, with the count de Précy, succeeded in reaching Savoy. The victorious army took possession of the now defenceless city, and a fearful train of cruelties followed for five months, under the direction of Couthon, Collot d'Herbois, and Maignet. The guillotine was rendered permanent; and its operation being too slow, the wretched prisoners were mowed down by grape-shot. Nearly six thousand victims perished, including those who fell in the defence; the principal buildings were demolished; and the Convention, as if in mockery, gave a new name to the city, that of Commune Affranchie.

This dreadful blow, together with the long war which followed the French revolution, caused the commerce and manufactures of Lyon to languish. In 1806 the population was estimated at less than 90,000, only half its population at the time of the fatal siege. On the return of Napoleon from Elba in 1815, the count of Artois (afterwards Charles X.), brother of Louis XVIII., the duke of Orléans (the present king of the French), and Maréchal Macdonald, hastened to Lyon: but on the approach of Napoleon, the populace and the army raised the cry of 'Vive l'Empereur,' and the princes retired. Napoleon took possession of the city, and issued a decree annulling the chief political changes made during his absence.

In 1834 Lyon was the scene of great disturbances. Unions for the protection of their interests had been formed by the artisans, who took the name of Mutuellistes; and a reduction of wages by the masters occasioned a general turn-out. Political feelings mingled with the irritation caused by these circumstances, acts of disorder called for the interference of the civil and military authorities, and several arrests were made. The determination to bring the parties arrested to trial led to an insurrection. The rioters fortified themselves with barricades, took possession of the suburbs, and the place was contested for two days, with a loss of nearly 200 men to the military and more than that number to the insurgents, who, finding it hopeless to continue the contest, laid down their arms.

Lyon is situated at the confluence of the Saône with the Rhône. The general direction of the Rhône previous to the junction is from east to west, but in the city and vicinity its course is from north-north-east to south-south-west. The general direction of the Saône is from north to south, but it makes a bend, convex to the east, round the base of the hill Fourvière just before its junction with the Rhône. The two rivers enclose between them a long tongue of land extending to the south or south-south-west, on which part of the city is built. The junction of the streams formerly took place just south of the then existing ramparts of the town, and below the junction was an island called Mognat, or Mogniat, and several shoals; but about sixty years since (A.D. 1776) a new and straight channel was cut for the Rhône, carrying the point of junction above a mile farther down the stream, converting a considerable part of the former bed of the river into dry land, and uniting the island of Mognat and the shoals with the main. The prolongation of the bed of the Saône between the former and present points of junction was formed on the western side of what had previously been the bed of the united streams. By this great alteration a large extent of ground was gained, over which new streets and buildings are continually extending. Another considerable part of the city is on the hill Fourvière and at the base of it, along the right bank of the Saône; it is surrounded on the west by the antient town-wall. There are the remains of fortifications on the north side of that part of the city which is between the two rivers. These fortifications run along the hill of La Croix Rousse, which rises on this side, and which occupies the whole of the interval between the Rhône to the Saône. On the south-west of the city, adjacent to the part on the right of the Saône, are the three faubourgs, or suburbs, of St. Irenée, St. Just, and St. Georges, or La Quarantaine. On the north-west, extending along the right bank of the Saône, is the faubourg of Vaize, which forms a distinct commune, or municipality. On the north is the new commune, or municipal district of La Croix Rousse, on the hill of that name, comprehending the suburbs of Le Serin on the left bank of the Saône and St. Clair on the right bank of the Rhône. On the left bank of the Rhône is the faubourg of La Guillotière, which forms with the quarter Les Botteaux another distinct commune, or municipal district. South of the city is the new quarter, on the land gained by altering the bed of the Rhône, called, from the architect who planned it, the Presqu'île (or Peninsula) Perrache.

The Rhône has a medium breadth of about 650 feet. Its current is very rapid, and it is liable to sudden and great inundations; to prevent the disastrous effects of which, an embankment has been formed to protect the suburb of La Guillotière. There are three bridges over it: the Pont Morand, a wooden-bridge; the Pont Charles X., which has the foundation of the piers of stone and the other parts of wood; and the Pont La Guillotière, a stone bridge, leading to the suburb of the same name. On the right bank of the river is a range of quays, not much used for commercial purposes, and partly planted with trees; south of the city, on the same bank, an avenue extends along the Presqu'île Perrache, forming the commencement of the road to St. Etienne; another avenue, extending northward from the quays, forms the commencement of the road to Bourg-en-Bresse and Geneva. These quays and avenues form a tolerably direct line of more than three miles in length. There are on the left bank of the Rhône a promenade, the 'Cours Bourbon;' and several public gardens and houses of entertainment much frequented on holidays.

The Saône has a slower current and a more winding course than the Rhône. It skirts the hill of Fourvière, a projecting crag of which stretches down to the river. A passage was made by the Romans along the bank by cutting away part of this crag, which derived from that circumstance the name of Petra Excisa, now Pierre-Scise. On the summit of the crag stood a Gothic castle, long the residence of the archbishops when lords of the city. After the war of the League, in the sixteenth century, it was made a state prison; and demolished after the siege of 1793. The crag, which consists of granitic rock, is perpetually diminishing, being quarried for building. Both banks of the Saône are lined with quays, and have several basins or docks for boats. It is crossed by seven bridges in the city. The Pont de l'Archevêché (formerly Pont de Tilsit) and the Pont du Change are of stone, and are remarkable, the first for its elegant architecture, and the second for its antiquity. The Pont de Serin and the Pont d'Ainay have the foundation of the piers in stone, the rest of wood. The Pont St. Vincent and the Pont Volant are wholly of wood. There is one suspension iron-bridge and it was designed to throw another over from the suburb of Vaize to that of Serin. We know not if this design has been executed.

Besides these seven bridges, there is one below the city, partly of stone and partly of wood, just at the junction of the Saône with the Rhône. Over this bridge the railroad from Lyon to St. Etienne passes. The traffic by boats on the Saône is very great.

Between the Rhône and the Saône, in the Presqu'ile Perrache is a cut with a basin for boats; another large basin is in the suburb of Vaize on the Saône.

The interior and more antient part of the town has narrow, wet, and dirty streets, paved with inconvenient round or projecting stones, and lined on each side by a row of curbstones, designed not for footpaths, but to preserve the shops from accident by carts or other carriages. The houses are old and gloomy, six or seven stories high, with narrow courtyards into which the rays of the sun rarely penetrate. They are chiefly built of stone, and are of solid construction. In the newer parts of the town are some handsome streets. The quays are lined with good houses; those on the bank of the Saône are older than those on the bank of the Rhône. The whole number of the streets was variously estimated ten years since at from two hundred and fifty to three hundred. The squares and other open spaces amounted to near sixty. The principal is the Place Bellecour, otherwise Place de Louis le Grand. It is above 300 yards in length and has a varying breadth of from about 200 to 240 yards; it is planted with lime-trees, and has in the centre a fine equestrian statue of Louis XIV., in the place of one destroyed at the Revolution. This statue, two fountains which adorned the Place, and the fine houses which surrounded it, were destroyed after the siege of 1793, and the Place remained long in ruins. In the north of the city is the Place des Terreaux; and at the southern extremity the Place Louis XVIII. lately built. The quarter of Bellecour is the residence of the most wealthy people; there are many good houses in the quarters of St. Clair, Les Terreaux, and Perrache; the quarter of St. Jean, on the right bank of the Saône, is occupied principally by the members of the bar. Lyon is remarkable for the contrast frequently presented by the mean hovels which may be seen in immediate juxtaposition with the most splendid mansions.

Of the public buildings the cathedral is one of the most remarkable. The western front, which is praised by some for its magnificence, is on the whole heavy, but it has three richly ornamented doorways, and over the central doorway a fine circular window. The interior of the building is of simple but striking architecture. In this cathedral there is a curious clock, which shows the year, the month, the day, the hour, the minute, and the second; the sun's place, the phases of the moon, and the saints' days of the calendar. It is now out of repair. The church of the Chartreux, on the slope of the hill of La Croix Rousse in the northern part of the city, has a good dome and a handsome high altar, that of St. Irenée (Irenæus), rendered a mere shell by the siege of 1793, has a handsome front; that of Enay is remarkable for four granite columns which support its cupola, and which were taken from a Roman temple, dedicated to Augustus, that occupied the same site; that of St. Nizier is of Gothic architecture with a Grecian portico, the work of Philibert Delorme; that of the Collège has a fine nave, of St. Just is a modern building in good taste and proportion. The churches of Lyon generally are but little worthy of notice. The Protestants occupy as a church a building originally designed for an exchange.

The archbishop's palace, though it has some fine rooms, has little exterior beauty. The Hôtel de Ville, or town-hall, is perhaps the finest public building in Lyon. It has a fine front with a clock-tower rising from the centre. It was built A.D. 1646-55, by Simon Maupin, and is considered the finest building of the kind in Europe, except that of Amsterdam. It forms one side of the Place des Terreaux; another side is formed by the former Benedictine abbey of St. Pierre, now called 'Le Palais du Commerce et des Arts.' It is used as an exchange, a repository for several museums or collections of objects of science and art, a place of meeting for several learned societies, a school of instruction in drawing, anatomy, &c., and for other purposes. The prefect's office, formerly a Dominican convent, is remarkable rather for its extent than its beauty. It has a tolerably extensive garden. The Hôtel Dieu, or hospital, and the Hôpital de la Charité, destined for foundlings and for the aged and infirm poor, front the banks of the Rhône; the former is a building of noble extent and appearance, with a fine dome in the centre. There are several theatres; the Grand Théâtre built by Soufflot has been lately replaced by a new building.

The population of Lyon in 1826 was 145,675: this number probably includes the inhabitants of Vaize, La Croix Rousse, and La Guillotière. In 1831 the population of Lyon was 133,715; that of the commune of Vaize was 4237 (of whom 3586 were in the town); that of the commune of La Croix Rousse was 9213 (of whom 9080 were in the town); and that of the commune of La Guillotière, 18,294 (of whom about 12,000 were in the town): together, 165,459. In 1836 the population of Lyon was 15[illegible] and if we estimate the increase of population in Vaize, La Croix Rousse, and La Guillotière to have been in proportion to that of Lyon, the aggregate population of the place will be little short of 185,000. Lyon is the greatest manufacturing town in France. Its staple manufacture is that of silk, which is highly esteemed for the durability of the colours and the good taste of the patterns. Mixed fabrics of silk and cotton and of silk and wool are manufactured; also shawls, crapes, silk stockings, gold and silver stuffs, ribands, and embroidery. The greater part of the silk produced in France is worked up in the looms of Lyon; and a large supply is drawn from Italy. The silk from the worms reared in the immediate vicinity of the city is naturally of a pure white. In 1828 the number of factories or smaller establishments for the silk manufacture in all its branches was 7140 within the walls of Lyon; the looms were 18,829; to which may be added, for the suburbs and the communes within about fifteen miles of Lyon on every side, about 5000 or 6000 looms: making in all 24,000 to 25,000 looms for the district of which this town is the centre. The hat manufacture, though it has declined from its former flourishing condition, is still considerable. Good earthenware is made, and gold-wire drawing is managed with great skill. Among the buildings devoted to the purposes of trade are the 'Condition des Soies,' where the merchants are obliged to deposit the silk brought to the city, that it may be effectually deprived of the moisture contracted in the throwing-mills or on the road; the depôt for colonial produce and foreign goods; and the depôt for salt. Among the subordinate branches of industry are printing and bookselling, and the manufacture of printed cottons, paper hangings, artificial flowers, iron goods, plate, jewellery, glass, and hardware. There are breweries and curriers' shops. Trade is carried on in groceries, spices, and wines. Chesnuts form also a considerable article of trade: they are brought chiefly from the departments of Ardèche, Loire, Isère, and Var, and are sent from Lyon to various parts. The town is the emporium of the fine woollens of Elbœuf, Sedan, and Louviers, with which it supplies the other towns of the south; and of the oils and soaps of Provence, and the wines and brandies of Languedoc, which it despatches to the north of France. The mercantile men of Lyon have the reputation of close attention to business, exactness in calculation, prudence in their undertakings, and strictness in the fulfilment of their engagements. Wealth is more equally diffused than in other great commercial towns, and capitalists are less subject to great vicissitudes. Luxury has made less progress here than in similar places. Fondness for the country is a industrious character of the inhabitants. The beautiful environs of the town are studded with country-houses; and on holidays the vast population pours out of the town in swarms to enjoy a purer air. Science and art are more cultivated than in most other trading towns; they are however valued chiefly for their bearing on commerce and manufactures. The town is the seat of an Académie Universitaire, the circuit of which comprehends the departments of Ain, Loire, and Rhône. There is a public library of 92,000 volumes and about 800 (some authorities say 1500) manuscripts. There are schools of theology and medicine; a seminary for the priesthood; a royal academy of sciences, belles-lettres, and arts; and various other institutions for the promotion of knowledge. There are three hospitals, a subscription dispensary, a maternity society, a deaf and dumb institution, and many other charitable institutions. The archbishopric of Lyon (now united to that of Vienne) is very antient. The diocese comprehends the departments of Rhône and of Loire: the suffragans of the archbishop are the bishops of Autun, Langres, Dijon, St. Claude, and Grenoble. There are a Protestant consistory and a Jews' synagogue. The Cour Royale of Lyon has under its jurisdiction the departments of Ain, Loire, and Rhône; there are two prisons in the town, and several subordinate judicial courts and fiscal offices. There are a mint, a royal powder refining-house, and a royal snuff manufactory. Lyon is the capital of the nineteenth military division, which includes the departments of Rhône, Loire, Cantal, Puy de Dôme, and Haute Loire.

Among the eminent natives of Lyon were the Roman emperors Claudius and Caracalla, the poet Sidonius Apollinaris; the architect Philibert Delorme, who built the Tuileries; the botanist Jussieu, and Maréchal Suchet.

The arrondissement of Lyon comprehends an area of 501 square miles; it had, in 1831, a population of 232,370; in 1836, of 189,941. It contains 130 communes, and is divided into 16 cantons, or districts under a justice of the peace.

LYONAIS, or LYONNAIS, a province of France previous to the Revolution, deriving its name from the city of Lyon, which was the capital of it. It was bounded on the north by Bourgogne; on the east by the principality of Dombes, the district of Bresse, and the province of Dauphiné, from all which it was separated by the Saône and the Rhône; on the south by the districts of Le Vivarais and Le Vélay, in Languedoc; on the west by Auvergne and Le Bourbonnais or Bourbonnois. It was subdivided into three parts, Le Forez on the west and south, Le Beaujolais or Beaujolois on the north, and Le Lyonnais proper on the east [BEAUJOLAIS; FOREZ]; and comprehended several towns beside Lyon, as Beaujeu, Villefranche, Feurs, Montbrison, Roanne, St. Etienne, L'Arbresle (formerly La Bresle), Tarare, St. Chamond, and others. It is now divided into the departments of Rhône and Loire. The province of Lyonnais-Forez, in the anarchy which preceded the extinction of the Carlovingian dynasty, an hereditary county; but this county does not appear to have included the city of Lyon. The partition of the county among the different branches of the family led to the separation of the lordship of Beaujolais and the county of Forez. It is not clear whether the district of Lyonnais Proper passed with the city of Lyon under the government of the archbishops of that see, and subsequently of the French crown, or whether it was subject to the county of Forez. The former is most likely.

Lyonnais was the country of the Segusiani. It was included in the Roman province of Lugdunensis Prima. It was subsequently in the power of the Burgundians and of the Franks. It does not appear that any part, except the city and environs of Lyon, was incorporated with the German empire. The counts of Lyonnais and Forez were vassals of the French crown.

LYONSIA, a genus of Conchifera belonging to the Myarian group. Mr. G. B. Sowerby has described two species: one, *L. picta*, found by Mr. Cuming at the island of Muerte, attached to particles of sand in eleven fathoms water, and which becomes rather irregular in form as it increases in size; and the other, *L. brevifrons*, found at Saint Helena, in sandy mud, at depths ranging from six to eight fathoms, attached to particles of sand.

LYPORNIX, Wagler's name for a genus of birds with a moderate bill defended by very long bristles, and both mandibles nearly equal, the wings very short and rounded, and the tail narrow. Example, *Lypornix striata* (Brazil).

Mr. Swainson arranges the form as a subgenus of *Tamatia* (Puff Birds) (Classif. vol. ii., p. 184), under the family *Halcyonidae*. [KINGFISHERS, vol. xiii., p. 227.]

LYRA (the Harp), one of the old constellations, representing the lyre of Mercury (Aratus), of Mercury or of Orpheus (Hyginus). It is surrounded by Cygnus, Aquila, Hercules, and the head of Draco. Its brightest star, α Lyrae, also called Vega, is a conspicuous object. If a line be drawn through the middle of Cassiopea, the pole-star, and the middle of Ursa Major, this star may be seen nearly in the perpendicular to that line drawn through the pole-star. When Aquila is known, a line drawn through its four neighbouring stars, θ, β, α, and γ, will pass through α Lyrae. Its principal stars are as follows:—

Character	No. in Catalogue of		Magnitude
	Flamsteed	Astron. Soc.	
κ	1	2113	5
α	3	2155	1
ε	4	2159	5
	5	2170	6
ζ	6	2171	5
β	10	2177	3
δ²	12	2191	4
γ	14	2200	3
η	20	2232	6
θ	21	2242	6

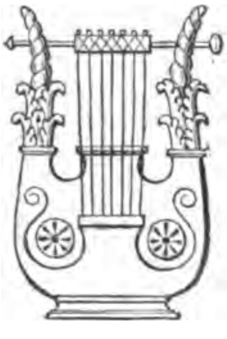
LYRA. (Ornithology.) [MENURA.]

LYRE (λύρα), a musical instrument of the stringed kind, known, under various names, from the earliest historical period. The Greeks ascribe its invention, some to Mercury, some to Apollo; but it is possible that they may have had it from the Egyptians, and the Egyptians from Asia. Indeed Holy Writ leads us to conclude that it was of antediluvian origin. Jubal, the seventh only in descent from Adam, was 'father of all such as handle the harp and organ;' and as by the word *harp* we are to understand either the *lyre* itself, or some instrument analogous to it, we must, on such authority, grant to the son of Lamech the merit of being its inventor. In our version of the Scriptures, *kinnor* (כנור) is rendered by the word *harp*, while the Septuagint and Vulgate give the Hebrew term a Greek form—κιθάρα, *cithara*, a word generally, though we believe erroneously, supposed to be synonymous with λύρα, or lyre. Erroneously, we say, because it is our opinion that Lyre and Cithara (or guitar) were generic terms; the first being the parent of all instruments of the harp kind, having no neck, or finger-board; the last, of all those furnished with a neck, and which finger-board probably was divided by frets. [GUITAR; HARP.]

It is true that in all the remains of Grecian art, no instrument with a neck is to be found. Artists perhaps preferred the more compact and elegant form of what is now called the Grecian lyre. The same taste descended to the moderns; witness the statue of Handel in Vauxhall Gardens, as Dr. Burney well remarks. Montfaucon tells us that he had examined the sculptured representations of six hundred antient lyres and citharas, and found not one with a neck. But had the learned father—who was a most excellent and indefatigable antiquary—lived in the present day, he would have met with abundant evidence in Egypt to prove that instruments with necks—instruments of the guitar kind, such as were subsequently called *lutes*—existed at least three thousand years ago. The three-stringed guitar, says Mr. Wilkinson (*Manners and Customs of the Antient Egyptians*), was in use at the earliest period of the Egyptian history; 'those at the pyramids are apparently of a date long previous to Osirtasen, or the arrival of Joseph.' And in Rosellini's splendid work 'I Monumenti dell' Egitto e della Nubia' are many engravings, some coloured, exhibiting instruments of great antiquity, resembling in essential points the modern guitar, or lute, with a neck, but this much elongated.

The most antient Grecian lyre is said to have been formed by Mercury from the shell of a tortoise, and of which the subjoined is a representation, as given by Mersenne:—

had but three strings. That of Terpander (from Blanchinus) had seven, and took the annexed form—



Timotheus increased the number to eleven; and others were gradually added, till they reached sixteen, fifteen of which rendered the principal sounds in the Greek scale, and the sixteenth was the *Proslambanomenos*, *i.e* the added or supernumerary sound.

LYRIC POETRY is commonly understood to be that kind of poetry which is composed in order to musical recitation, but the epithet has been transferred to all kinds of verse partaking in any degree of the same nature as that to which it was at first applied. Thus we hear of lyrical ballads, the greater part of which might with as great propriety be called epical, and of lyric measures in Horace, where there is no ground to suppose that they were sung, and no fitness for the purpose of musical rehearsal. In a former article [Epic Poetry] we have endeavoured to point out a distinction between epic and lyric poetry more satisfactory than common language allows; but there is surely no impropriety in giving a decided meaning to words which have usually been understood in a confused sense, particularly when, as in the present case, the same senses have been applied to each, so as not only to confuse but to confound them. Pursuing then the course which we have pointed out, lyric poetry must be defined as that class of poetry which has reference to and is engaged in delineating the composer's own thoughts and feelings, in distinction from epic poetry, which details external circumstances and events.

A very slight glance at the growth of society will be enough to show us that lyric poetry is posterior in point of time to epic. Men think of war and hunting, of anything and everything which surrounds them, before they look at themselves; and as consciousness in the child comes much later than the exercise of all the senses, so that it learns the names of many objects before it begins to call itself 'I'; so in the development of national life the epic period comes before the lyric. Homer and Hesiod were favourites for centuries before the invention of an epigram or a chorus; the narrative novel or romance precedes the novel of manners, and our own epical cycles existed long before anything in the form of lyric poetry.

The history of lyrical poetry is perhaps subject to greater difficulties than any other species of composition. In that nation where it attained to its most perfect growth, it is precisely that class of its literature which is to us, except in regard to one author, a total blank. Pindar is nearly all that remains to us of the whole lyric poetry of Greece, and great as his reputation has deservedly been, we have no n to consider him as paramount to his class, and very good reason for denying to him what has commonly been considered his right, that of presenting us with the purest type and example of a lyric poet. With almost as much reason might he be called an epic writer, for many long passages occur in which he does not deviate at all from the path of narration, while in others again he is all but a dramatist. Thirlwall has observed too, that 'even if it was certain that his genius was unequalled, still it could not replace the freshness which we might expect to find in the earlier gushes of the lyric vein, nor that peculiar character which distinguished each of the other poets, nor that which belonged to the several schools formed by the great tribes or branches of the nation.' We have thus to deplore in Tyrtæus the loss of writings which kept up the patriotism of a whole nation; in Hipponax and Archilochus, all the circle of Greek satire; in Anacreon, the first poems on the fruitful subjects of love and feasting; and in Mimnermus, the Greek elegy, that offspring of the sadness which reflection on the fleeting nature of human enjoyments produces. But most of all have we to regret that scarcely any trace remains of that link between epic and lyric poetry which was the origin of Greek tragedy. This was perhaps the most national form of lyric poetry among the Greeks, the others having been for the most part rather the productions of individual imaginations, which gained popularity in proportion as they found sympathy, much in the way in which modern poetry makes its way into notice.

Ulrici, in his very elaborate work on the history of Greek poetry, gives two as the principal sources from which lyric poetry was derived—religious worship, and the individual feelings of the people; the first of which elements is traceable in one of the two kinds of epic poetry, which we name *hieratic*, while the second is that in which consists the difference between epic and lyric poetry. He proceeds to divide Greek lyric into the Doric, Æolic, and Ionic kinds: which correspond nearly, the first to what is to be found in choruses; the second to love-songs, such as Sappho's, and drinking-songs, or scolia; and the third to the elegy, epigram, and satire of Callinus, Archilochus, Tyrtæus, Hipponax, and others. We have no space to do more than notice his division of the subject, but the whole work will repay a far closer attention.

It has been remarked that both in epic and in lyric poetry the Romans possessed nothing like a school of poets, whereas in Greece there was a regular progression from epic to lyric schools, each of which supplied many individuals grouped round a principal figure in each class. Virgil and Lucan are the types of Roman epic poetry, and Horace stands almost alone as a lyric poet. But to attempt to give a history of Roman lyric would be little else than to enumerate every man who wrote verses from Ennius downwards, for almost every one of them attempted that as well as all other kinds of poetry. The whole of Latin poetry was in fact on a Greek model, even the most original of the Latin poets having borrowed his metres, though he might make everything else his own.

It might perhaps startle any one to be told that satire is a branch of lyric poetry, and that the most important branch of Roman lyric is satire. But a careful review of the definition with which we started cannot fail to explain this. Satire is essentially lyrical or subjective in its nature, and the Roman satire more so than the Greek, inasmuch as it partakes far less of the nature of lampoon or ludicrous description, and deals more with general than with individual traits of character. In their satire it is that we must look for information on Roman modes of thought and feeling. It was, or at least appears to us to have been the only outlet which the Imperial tyranny gave to the free and noble spirit of Rome in her best days, and it is quite astonishing how far this liberty was employed. What it was in earlier days we cannot tell, except as far as Horace's description of Lucilius avails. The words may mean almost anything, but we should be inclined to suppose that it partook much more of the nature of lampoon than in [illegible] times. To the satire we may add its powerful auxiliary the epigram, the same in name but very different in nature from its Greek fellow, which ought rather to be called epigraph, or even epitaph

The Horatian lyrics merged in the later ages of the empire into a species of poetry much though undeservedly neglected, we mean the rhyming verses of the monks, which contain much Hebrew sublimity expressed in most sonorous verses. They are curious as affording the best specimen of the transition from quantity to accent, that is, from the antique to the modern rule of versification.

English lyrical poetry is late in its full development, for to call our ballads lyrical is a misnomer, seeing that the prose and poetical romances often give exactly the same story in another shape. We need go no further than the ballad 'Mort d'Arthur,' so well known to readers of Percy's 'Reliques.' At the same time though the *form* of these ballads is mostly narrative or epical, there is often a strong admixture of lyrical feeling, as in 'The Jew's Daughter,' 'Sir Cauline,' and others. Scarcely any poems occur before the time of Milton deserving the title of lyrical, except perhaps some of Wither and Phineas Fletcher's works and Shakspere's sonnets. In 'Lycidas,' 'Il Penseroso,' and 'L'Allegro,' we see almost the first, and perhaps the most beautiful examples our language can boast. The prevalence of French taste until the revival of poetry at the close of the last century gave so artificial a character to the works of Dryden, Pope, and their successors, that we can hardly give the title of lyrical to any of them excepting [illegible] and a few fine odes. In our own day Wordsworth and Coleridge are too well known to require that we should point out how distinctively lyrical is the tendency of their works. Shelley has combined more of what is called sensuous beauty with the rest of the qualities requisite to make up a lyrical poet; and, among living poets, Tennyson may perhaps be mentioned as giving the greatest promise of lyrical excellence, although he has yet written so little, and that little has so many of the redundancies of a young writer, that it is hard to predict with certainty his future course.

It is natural to anticipate what may be the course of poetry in our own time, and perhaps the balance of probability is on the side of its taking a lyrical or subjective character. Novels have shut out the drama, and epic poetry is utterly at variance with the feelings of the age; so that if our children are to have any poetry at all, it must apparently partake largely of a lyrical character, and that probably not unmixed with satire, of which, since the 'English Bards and Scotch Reviewers,' we have had scarcely a specimen.

(Ulrici's *Geschichte der Hellenischen Dichtkunst*; Dunlop's *Hist. of Roman Literature*; *Quarterly Review*, articles on Pindar and Horace.)

LYRICS are those verses which are commonly used in lyrical poetry. Such are those of Pindar, of Horace's odes, and of the tragic and comic choruses. These are generally short, in order, as is said, to agree better with the time of any music which might have been intended to accompany them. The old grammarians divided all verses into those in which the metre was repeated in each line (κατὰ στίχον), such as hexameters, iambics, and trochaics, and those which require more lines than one to make up a system (κατὰ σύστημα), as in the case of Sapphic or Alcaic verses, or a choric strophe. The latter division contains almost all the lyric metres known, including nearly all Horace's odes, all Pindar's, and all the choruses and even anapæstic systems. Of these strophes a further division has been made into *longer*, such as Pindar, Stesichorus, Simonides, and the Greek dramatists employed; and *shorter*, such as those of the earlier Ionian and Æolian poets, of their imitators and of Seneca, besides rare examples in the Greek dramatists.

Hermann further distinguishes the longer strophes into Dorian, Æolian, and Lydian, of which he gives examples from Pindar to prove that the first was used where impressive majesty was requisite, the second to give a notion of rapidity and vehemence, and the third as possessing part of the qualities of each.

A question has arisen, and it is at all events a curious point, why lyrical poems are generally divided into lines so much shorter than heroic. That such was the case in Greek and Roman poetry is certain, and it is not explained by saying that they were sung to an accompaniment, for surely there is just as much reason to suppose that Homer's long hexameters were chanted as Anacreon's short iambics, and they might be as well adapted to one as to the other.* Perhaps it is better accounted for by considering that a lyrical poem does not consist of descriptions, where the same event may be expressed in many ways, but in thoughts, which, to be striking, must be terse. Take for example the following poem—

Ὑγιαίνειν μὲν ἄριστον ἀνδρὶ θνατῷ,
δεύτερον δὲ, καλὸν φυὰν γενέσθαι·
τὸ τρίτον δὲ, πλουτεῖν ἀδόλως·
καὶ τὸ τέταρτον, ἡβᾷν μετὰ τῶν φίλων.

Hesiod would probably have spun them out into five or six hexameters,* inserting epithets and expanding at pleasure, but converting each from the *expression* of a moral sentiment in which the hearer is supposed to agree, into the inculcation of a precept of prudence which he is to follow.

(Hermann, *Elementa Doctrinæ Metricæ*.)

LYS. [Belgium; Scheldt.]

LYSANDER, a Spartan, who rose to eminence towards the end of the Peloponnesian war, and was placed in command of the Lacedæmonian troops on the coast of Asia Minor, B.C. 407. Having about him little of the old Spartan severity, and being ready to sacrifice that personal and national pride and inflexibility, which were the peculiar characteristic of the Spartan institutions, to personal or national interests, he gained in an unusual degree the regard and confidence of his Persian allies. This he used to the best advantage, by seizing a favourable moment to obtain from the younger Cyrus, the Persian viceroy in Asia Minor, in place of any personal advantage, the addition of an obolus daily (rather more than a penny) to every seaman in the Peloponnesian fleet. During his year's command he defeated the Athenian fleet, commanded by Antiochus, as lieutenant of Alcibiades, at Notium. In September, 406, he was superseded by Callicratidas; who was defeated and slain in the memorable battle of Arginusæ. The allies then petitioned that Lysander might be re-appointed. It was contrary to Spartan law to entrust the fleet twice to the same person; but this difficulty was evaded by nominating another person commander-in-chief, and sending Lysander as lieutenant with the command in Asia. He soon justified the preference, by gaining the decisive victory of Ægospotami, in the Hellespont, where 170 Athenian ships were taken. This in effect finished the war. Receiving as he went the submission of her allies, Lysander proceeded leisurely to Athens, and blockaded the ports, while the Spartan kings marched into Attica and invested the city, which, unassaulted, was reduced by the sure process of famine. The capitulation being settled, B.C. 404, Lysander had the proud satisfaction of entering as a victor the Peiræus, unviolated by the presence of an enemy since the Persian invasion.

His services and reputation gained for him a corresponding weight in Sparta; and on occasion of the contested succession his influence was powerful in raising Agesilaus to the throne. He accompanied that eminent statesman and soldier during his first campaign in Asia, where his popularity and renown threw his superior into the shade; and an estrangement resulted, in which Lysander behaved with temper and wisdom. About B.C. 396 he returned to Sparta. In the following year, on occasion of a quarrel with Thebes, he was sent into Phocis, to collect contingents from the northern allies, a task for which his name and popularity rendered him peculiarly fit. Having done this, and being on his way to join the Lacedæmonian army, he was taken by surprise, and slain by the Thebans, at Haliartus in Bœotia. The force which he had collected dispersed; and the war came at once to an end, with no credit to the Lacedæmonians, B.C. 395.

It is said that, urged by ambitious hopes, he meditated a scheme for abolishing the hereditary right of the descendants of Hercules, and rendering the Spartan throne elective, and that he had tampered largely with different oracles to promote this scheme. The contemporary Xenophon however makes no mention of this rumour. This subject has been discussed by Mr. Thirlwall in an appendix to his fourth volume of the 'History of Greece.' [Alcibiades; Athens; Agesilaus.]

Syracuse, who settled at Athens during the time of Pericles; he was a person of considerable wealth, and lived on intimate terms with Pericles and Socrates. His house is the supposed scene of the celebrated dialogues of Plato's 'Republic.'

Lysias, at the age of fifteen, went to Thurium in Italy, with his brother Polemarchus, at the first foundation of the colony. Here he remained for thirty-two years; but in consequence of his supporting the Athenian interests, he was obliged to leave Italy after the failure of the Athenian expedition in Sicily. He returned to Athens B.C. 411, and carried on, in partnership with his brother Polemarchus, an extensive manufactory of shields, in which they employed as many as 120 slaves. Their wealth excited the cupidity of the Thirty Tyrants; their house was attacked one evening by an armed force, while Lysias was entertaining a few friends at supper; their property was seized, and Polemarchus was taken to prison, where he was shortly after executed (B.C. 404). Lysias, by bribing some of the soldiers, escaped to the Piræus, and sailed from thence to Megara. He has given us a graphic account of his escape in his oration against Eratosthenes, who had been one of the Thirty Tyrants.

Lysias actively assisted Thrasybulus in his enterprise against the Thirty; he supplied him with a large sum of money from his own resources and those of his friends, and hired a considerable body of soldiers at his own expense. In return for these services Thrasybulus proposed a decree, by which the right of citizenship should be conferred upon Lysias; but in consequence of some informality this decree was never carried into effect. He was however allowed the peculiar privileges which were sometimes granted to resident aliens (namely, *ἰσοτέλεια*). Lysias appears to have died about B.C. 378.

The author of the life of Lysias, attributed to Plutarch, mentions four hundred and twenty-five orations of Lysias; two hundred and thirty of which were allowed to be genuine. At present there are thirty-four extant, attributed to this orator. But some of these may not be genuine; and at least the 'Epitaphius' bears strong internal evidence of being by another hand.

Dionysius of Halicarnassus has written a laboured essay on the style and merits of Lysias. He allows him almost every excellence except those of sublimity and the power of strongly moving the passions. 'His style,' he observes, 'is not so well adapted to show the power of art as to represent the truth of nature.' In narrating events or circumstances, Dionysius considers him as superior to all the orators, and as the rule and model in this department of the art. The 'Apology for the death of Eratosthenes' is a pattern of simple and perspicuous narration.

According to Suidas and other antient biographers, Lysias also wrote some treatises on the art of oratory (which he is said by Cicero (*Brut.*, c. 12) to have taught), and discourses on love. There is still extant a treatise on love, which bears the name of Lysias, and which has been edited by Haenish, Leip., 1827, but this work evidently belongs to a much later period in Greek literature.

The best edition of the text of Lysias is by Bekker. Useful editions have also been published by Taylor, 1738; by Foertsch, 1829; and by Franz, 1831. Lysias has been translated into French by Auger, Paris, 1783, and into English by Gillies, together with the orations of Isocrates, London, 1778.

(Dionysius of Halicarnassus; *Life of Lysias*, attributed to Plutarch; Photius, C., 261; *Life of Lysias*, prefixed to Taylor's edition.)

LYSI'DICE, Savigny's name for a genus of *Dorsibranchiate Annelids* [DORSIBRANCHIATA], which, with jaws like those of *Eunice* (Cuv.), or even more numerous than in that form, and often unequal in number, have only three tentacles, and cirrhi for *branchiæ*. See Savigny (*Eg. Annel.*), and Cuvier (*Regne Animal*).

LYSI'MACHUS, one of the officers of Alexander the Great, was born of an illustrious Macedonian family. (*Justin*, xv. 3.) In the general distribution of the provinces, or satrapies, to the chief Macedonian officers after the death of Alexander, Lysimachus received Thrace and the neighbouring countries. It was not however without difficulty that he obtained possession of the province which had been assigned to him; he was vigorously opposed by Seuthes, king of Thrace, and other native princes, and it was some time before his power was firmly established in the country. In B.C. 314 he joined Cassander, Ptolemy, and Seleucus in their endeavour to check the power of Antigonus [ANTIGONUS, p. 102]; but he does not appear to have been able to take an active part against Antigonus, in consequence of the revolt of many Thracian tribes who had been excited by Antigonus to make war against him. The peace, which was made between the contending parties B.C. 311, lasted only for a short time; and the war was continued with various success till the conquests of Demetrius, the son of Antigonus, in Greece, roused the confederates to make more vigorous exertions; and Lysimachus was accordingly sent into Asia Minor, B.C. 302, where he took several places, and acquired immense plunder. Antigonus hastened to meet him, but could not force him to a battle. In the following year Lysimachus, having formed a junction with the forces of Seleucus, met Antigonus at Ipsus in Phrygia, where a bloody battle was fought, in which Antigonus was killed and his army entirely defeated.

The dominions of Antigonus were divided among the conquerors, and Lysimachus obtained the north-western part of Asia Minor. He shortly afterwards married Arsinoe, the sister of Ptolemy, king of Egypt, although his eldest son Agathocles had already married Lysandria, the half-sister of Arsinoe. In B.C. 286 he obtained possession of the throne of Macedon, and obliged Pyrrhus, king of Epirus, who had laid claims to the kingdom, to retire to his native dominions. Hitherto the career of Lysimachus appears to have been fortunate, but the latter part of his life was embittered by family dissensions and intestine commotions. Arsinoe, fearful lest her children should be exposed after the death of her husband to the violence of Agathocles, persuaded Lysimachus to put him to death. Agathocles had been an able and successful general; he was a great favourite with the people, who deeply resented his death; and Lysimachus found himself involved in almost open war with his subjects. Lysandra, the widow of Agathocles, fled to Babylon, and entreated Seleucus to make war against Lysimachus. The Syrian king was willing enough to take advantage of the troubled state of his rival's kingdom; but Lysimachus, anticipating his intentions, marched into Asia, and fell in a battle with the forces of Seleucus, in the seventieth year of his age, according to Appian (*Syr.*, c. 64), and in his seventy-fourth, according to Justin (xvii. 1).

The town of Lysimachia was founded by this monarch on the narrow neck which connects the Thracian Chersonese with the mainland; its position was about midway between Pactya and Cardia, from which latter town most of the population were removed to the new city of Lysimachus.

Coin of Lysimachus.

British Museum. Silver Actual Size.

LYSIPPUS, one of the most celebrated statuaries of antiquity, was born at Sicyon. He was particularly distinguished by his statues in bronze, which are said to have been superior to all other works of a similar kind. He introduced great improvements in his art, by making the head smaller, and giving to the body a more easy and natural position than was usual in the works of his predecessors. Pliny informs us that his statues were admired among other things for the beautiful manner in which the hair was always executed. (Plin., xxxiv. 8.)

Lysippus is placed by Pliny in the 114th Olympiad (B.C. 324), contemporary with his brother Lysistratus, Sthennis, Euphronides, Sostratus, Ion, and Silanion. He is said to have been self-taught, and to have attained his excellence by studying nature alone. His talents were appreciated by his contemporaries; the different cities of Greece were anxious to obtain his works; and Alexander is reported to have said, that no one should paint him but Apelles, and no one represent him in bronze except Lysippus. (Plin., vii. 37; Cic., *Ad Div.*, v. 12.) His reputation survived his death; many of his most celebrated works were brought to Rome, in which they were held in so much esteem, that Tiberius is said to have almost excited an insurrection by removing a statue of Lysippus, called Apoxyomenos, from the warm baths, where it had been placed by Agrippa, to his own palace.

Lysippus is said to have executed 610 statues, all of the greatest merit (Pliny, xxxiv. 7); many of which were colossal figures. Pliny, Pausanias, Strabo, and Vitruvius have preserved long lists of his works; of which the most celebrated appear to have been, various statues of Alexander executed at different periods of his life; a group of equestrian statues of those Greeks who fell at the battle of the Granicus; the Sun drawn in a chariot by four horses at Rhodes; a colossal statue at Tarentum; a statue of Hercules, at Alyzia in Acarnania, which was afterwards removed to Rome; and a statue of Opportunity (καιρος), represented as a youth with wings on his ankles on the point of flying from the earth.

Among the numerous pupils of Lysippus, the most celebrated was Chares, who executed the colossal figure at Rhodes.
